SHRINES OF AMERICA

Halls of Liberty

BEFORE American independence was won on the battlefield it was first fomented and debated in the meeting hall. The three halls shown here figured in the most important of these early meetings. Faneuil Hall (top) in Boston, often called the "Cradle of Liberty," was one of the earliest meeting places of the New England patriots. Carpenters' Hall (left) in Philadelphia held the first Continental Congress in 1744 and saw many other fiery patriotic sessions. Independence Hall (right) in Philadelphia, greatest of them all, is where the Declaration of Independence was signed and where the Federal Government was formed and where it operated for the first few years of its existence.

THE WONDER OF THE DAIRY WORLD

The diagram above shows how the famous Rotary Combine Milking System at the Walker-Gordon farm, Plainsboro, N. J., operates. (A)—Cows step onto slowly moving platform; (B)—Cows washed; (C)—Operator wiping cow's udder; (D)—Operator takes foremilk from cows; (E)—Hot air dries cows; (F)—De Laval Milkers attached; (G)—Platform moves in this direction, completing a revolution in 12½ minutes and during that time 50 cows

are milked; (H)—Milkers taken off; (J)—Cows step off platform and go back to their barns from here; (K)—Milk automatically dumped, weighed and piped to bottling room; (L)—Milking machine rinsed with cold water; (M)—Milking machine sterilized with hot water. Milks at the rate of 250 cows an hour and is operated 24 hours a day to milk the Walker-Gordon herd of over 1500 cows, three times daily.

THIS remarkable new Rotary Combine Milking System now in use at the Walker-Gordon farm, Plainsboro, N. J., a division of the Borden Company, the oldest and largest certified milk producers in the world, is the wonder of all who have seen it.

The milking machine equipment was made by De Laval, and while much of this equipment was especially designed by us, yet the principle of milking is the same as that of all De Laval Magnetic Milkers, and the milking itself is exactly the same as that of the De Laval Magnetic.

The method of drawing milk into the glass jars without exposure to human hands or other contaminating sources is similar to that of the De Laval Magnetic Combine Milking System, which milks, weighs and conveys the milk from cow to bottle in one operation, and of which there are already a considerable number in use.

It is a splendid tribute to De Laval that the great Walker-Gordon organization should recognize the principles involved in De Laval milking as being correct and should have selected the De Laval organization to design and build their milking equipment.

Whether you may have five or 5000 cows there is a De Laval Milker which can be adapted for your needs, which will milk your cows better, faster and at less cost, and at the same time produce more and cleaner milk, than can be done in any other way.

Another Great De Laval Combination

THE great combination of De Laval machines illustrated at right is just as remarkable in its way as is the wonderful Rotary Combine shown above. With this outfit you can milk, separate, light your barn and heat water, all in one operation and at less cost and with greater satisfaction than can be done in any other way. It consists of the Alpha Dairy Power Plant, De Laval Magnetic Milker and "3,000,000" Golden Series De Laval Separator.

The Power Plant supplies power at extremely low cost, and in addition heats water for washing the milker and other dairy utensils for nothing. The De Laval Magnetic Milker, which gives the best milking, also generates enough surplus current so that it will light four special low-voltage electric lamps, sufficient to light the average barn in splendid man-

ner. This electric lighting costs the user nothing for maintenance and is a wonderful convenience and satisfaction.

The "3,000,000" De Laval Golden Series Separator is without question the world's best cream separator.

No matter what your separating or milking requirements are, there is a De Laval machine to do this work better than any other. See your nearest De Laval Agent or write the nearest De Laval office below.

What A.A. Readers Say

Banker Defends Interest Rates on Farm Loans

EDITOR'S NOTE—Because *American Agriculturist* is always willing to give both sides of every question, we are printing Mr. Burden's letter in which he comments on a recent editorial on the question of lower interest rates for farm borrowers. We would be glad to have letters from our readers giving their experiences along this line.

ON the editorial page of the *American Agriculturist* for October 11th appears an article entitled "Give The Farmers The Benefit Of Lower Interest Rates" which, because it does not give all the facts in connection with banking conditions, may, I fear, create a wrong impression in the minds of many of your readers.

Almost all country banks have accepted savings deposits on which they pay four percent interest and in some cases even more than that. Probably seventy-five percent of the country bank deposits fall in this class. This inevitably compels the charging of the full legal rate of six percent on all loans.

The apparent margin of two percent cannot be realized as a profit because of the legal reserve requirements and operating reserves and expenses. Reserves also must be set up to meet possible losses from loans and investments that are bound to happen even in the best regulated institutions.

New York City banks allow only two percent or less on deposits and are therefore in an entirely different class when it comes to the matter of a money market responsive to the actual supply of loanable funds.

Bank loans for agricultural purposes usually fall into the long term class and this is another important element that makes a fixed interest rate imperative.

The low money rates that one sees published from day to day are applicable only to short time loans or to call loans with stock exchange collateral security in both cases. Loans for agricultural purposes do not fall in this category.—HENRY BURDEN, *Cazenovia, N.Y.*

Would This Work Now?

I WAS once a farm hand for Thomas Metcalf, Pine Meadow, Northfield, Mass. He produced, as a first consideration, all his farm would supply of food, fuel, and shelter. He raised about sixty bushels of wheat and had what he required for food, home ground; thus had no flour bill. He milked about seven cows, kept about four horses and had his own poultry, woodlot, and a carefully bought equipment of farm machinery which he carefully housed when not in use. Then he specialized in one crop; tobacco, raising the high priced Havana leaf. He built his own house and outbuildings, produced his own beef, pork, and veal, bought fertilizers equivalent to the total he used for his tobacco, and kept two hired men and a boy during the busy summer season and no hired help at other

times. He produced his own seeds for important uses. In hot weather his wife at times bought a little fresh meat but she specialized in making a palatable whole-wheat bread with a little corn meal, and used for the most part home-grown produced meat, eggs, and smoked meats. The working day for hired help included chores and milking before breakfast but the first meal was finished at seven in the morning and the men sat down to supper at six o'clock except in rare emergencies and there was no after-supper work. This man had no mortgages, no debts, and was always prosperous and able to do well by his children.

A Tale of Two Power Developments

PRESIDENT Hoover at the White House in Washington turns a key. Seven hundred miles away at Barnet, Vermont, gigantic machines stir to life. Turbines start and at far away Tewksbury, Mass., the great new switching station receives its first load of 220,000 volts of electricity from the Fifteen Mile Falls Power Development.

Thus, with impressive ceremonies participated in by governors of four states and many other officials, the new England Power Association recently started into operation, its tremendous new plant on the Connecticut River. It has formed a lake eight miles long. It will develop 216,000 horsepower, and its transmission line, running down across New Hampshire in a swath 350 feet wide is 126 miles long.

But it is not the first great power development in that section of the old Coos country. There was another 166 years ago, when in the winter of 1764, four men started on snow shoes and traveled from Newbury, Vermont, to Concord, N. H. to bring back a mill crank. There were none yet in the settlement. The tale of their hardships and sufferings in bringing it through the hundred miles of wilderness is in the ancient chronicles of the region. Saved by one of their number from freezing on New Found Lake; giving out in the deep snow in the mountains and being rescued by a party from the settlement—but at length they brought it in. It was installed in a mill built for it on a stream in Newbury, and the first power plant in all that section of what is now Vermont was set in operation, running an old up and down saw. Sawed lumber thenceforth displaced hewn logs; houses and barns displaced huts and log shelters; furniture of sorts was built, and rough settlements became villages. It was only a hand forged iron crank, four or five feet long, made to transmit power from the wheel, as anyone may observe among the relics in the D. A. R. Chapter House at Newbury, and it was drawn on a hand-sled.

Maybe some major student in economics can tell us which of these developments was of the greatest importance to the people of their times.—H. L. BAILEY.

February Fern's Noble, selected as the grand champion Jersey bull at the 1930 National Dairy Exposition, St. Louis, Mo., also won this highest honor at the New York State Fair, Syracuse, N. Y., the Eastern States Exposition, Springfield, Mass., and the Eastern Pennsylvania Parish Show, Bryn Mawr, Springfield, Mass., and the Eastern Pennsylvania Parish Show. He is owned by P. H. B. Frelinghuysen, Twin Oaks Farm, Morristown, New Jersey.

1930---A Bad Year for Prophets

Profits Were Not So Good, Either---What Will 1931 Bring ?

By GILBERT GUSLER

Standard Farm Paper Market Analyst

NINETEEN-THIRTY was a bad year for both profits and prophets. Quoting one of the best known business forecasters, "This business depression is very much more severe than anyone expected it to be." Taking the forecasts of probable business activity issued a year ago as a basis for calculations, the decline in demand for farm products has run much beyond expectancy. Then, the worst drought in a generation withered the returns of many farmers.

This writer's belief was that aggregate farm income in 1930 would be two or three per cent less than 1929. Instead, it seems to have been cut 15 per cent or more. My pessimism was not enthusiastic enough. City prosperity blew out its fuse in 1929. Which was cause and which was effect in the beginning and which effect came from which cause is open to dispute, but a number of conditions have been adverse to industry and trade in the past year.

A Vicious Circle

The aftermath of a tremendous urban real estate and building boom has brought idleness to thousands in the building trades, and depression to allied material and equipment industries. The period of high industrial output in 1929 built up excessive inventories of automobiles, radios, and some other lines of goods. Unemployment due to the displacement of men by machines has been increasing, as new industries were not developing fast enough to bridge the gap. Thousands of people with securities, real estate, or consumption goods only partly paid for, suddenly found themselves obliged to curb their spending in order to reduce debts and, in many cases, make these payments from shrunken incomes.

The world's gold resources were wastefully used, due to heavy accumulations in France and the United States. This reduced the credit base

in other countries and tended to force the world level of prices downward. Heavy international debts became burdensome in the period of high interest rates in 1928 and 1929, drying up the stream of foreign loans placed in the United States which had been financing our export trade. Creditor countries like the United States were unwilling to receive payments foreigners wished to make on debts as these could only be paid in goods. Instead, tariffs were pushed upward, add-

ing another depressing influence on prices in debtor countries.

Raw Materials Accumulated

Heavy supplies of raw materials had accumulated over a period of time, due in many cases to efforts to sustain prices artificially, and including rubber, coffee, sugar, wheat, rye, cotton, silk, camphor, tin and copper. With prices maintained at a level that brought forth more production than the demand would absorb, these efforts bogged down, lowering the purchasing power of producers.

Along with these influences which affected prices for farm products both directly and indirectly were others of primary importance to agriculture, such as the return of Russia as a heavy wheat exporter.

Altogether, it's quite a mess. The disturbance to industry and trade has thrown around 15 per cent of the industrial classes in the United States out of work. The reduction of the total income of the group is estimated at 20 per cent. Unemployment has become more serious abroad.

Demand Most Important Now

Usually, supply conditions are the principal variable in causing fluctuations in farm prices and farm income. In 1930, however, demand was dominant. Hence, the outlook depends considerably on when a recovery in demand will occur.

Thus far, the sum total of all these forces remains adverse. Curves of business activity, employment and prices are still falling. The rate of change seems to be becoming smaller, however.

Eventually, demand will improve, business will expand, employment will increase and prices will strengthen. The questions are when and at what level the improvement will start. For an answer,

Some Facts About Sweet Clover

This Crop Once Classed as a Weed, Now Growing in Popularity

By H. A. HUSCHKE

National Lime Association

FROM a cursed weed to a blessed farm crop in fifteen or twenty years is, briefly, the romantic history of sweet clover. In its role of weed it is found along roadsides, railroads, streams, and almost everywhere. But as a farm crop, we most often see it in the fields of farmers who are alert to better farm practices. Compared with other popular forage and manuring crops, sweet clover is as yet in its infancy; but it is a sturdy babe in robust health and its popularity is truly "growing like a weed."

Not Difficult To Raise

The corn belt states have made the most rapid strides in sweet clover culture. Fifteen years ago Ohio had less than 1000 acres of this crop; today, over 300,000 acres are grown. And the reason for this is quite apparent. Sweet clover has a place in almost all systems of agriculture. The dairy farmer has found it to be an excellent crop for pasture, hay, silage and green manuring. The swine and beef cattle grower finds his hogs and steers make excellent and profitable gains when they run on sweet clover pasture. The grain farmer gets increasingly larger yields of wheat, barley, oats or corn after each succeeding crop of sweet clover plowed under.

Sweet clover is not a difficult crop to raise. It is not as critical to adverse conditions as alfalfa or red clover. Good stands are obtained on relatively poor soils. It will grow on poorly drained soils about as well as alsike and tolerates drought and weeds better than alfalfa. It does however draw the line on soil acidity. In its uncultivated state, as a weed, it grows fairly well on acid soils but when raised as a crop it requires a neutral or slightly alkaline soil. Probably more sweet clover failures are caused by soil acidity and a

lack of lime than any other factor. Even alfalfa is no more lime-needy than this crop.

The increasing popularity of sweet clover hinges on the fact that it is a legume. Like other legumes it has the ability, through the bacteria in the nodules of its roots, to take nitrogen from the air and store it in the leaves, stems, and roots as protein. Because this crop is rich in protein it is valuable as a feeding crop for all livestock. And for this same reason it is used so extensively to plow under as a green manure crop. Ohio Experiment Station has recently stated that a good crop of sweet clover takes from the air as high as two hundred fifty pounds of nitrogen per acre. When turned under the greater part of this becomes available as plant food for the next crop. With the nitrogen in commercial fertilizers costing in the neighborhood of ten to fifteen cents per pound, it is worth as high as \$37.50 per acre for the nitrogen added to the soil, alone. In addition, the good effects of the organic matter in making the soil looser and more friable as well as the increased water holding capacity and improved drainage of the soil, are important factors.

A Leading Green Manure Crop

Most New York State farmers seem to shy away from the idea of plowing under green manuring crops. When a good stand of any of the legumes is obtained, the temptation to turn it into hay is beyond resistance. While hay raising is of primary importance especially to the dairyman, of even greater value is soil productivity. A good sweet clover crop turned under once in every rotation has aptly been termed "an insurance policy against lean years in the future." From various sources, we hear reports of substantial crop increases following legume cover crops. Nor is this

surprising when we consider the amount of nitrogen added to the soil and the general good effects that come from increasing the humus.

There are four distinct kinds of sweet clover. They are the annual white, the biennial (two year) white, the annual yellow and biennial yellow. In localities where the crop is grown extensively, the two-year or biennial white is favored over the others. However the choice depends on how the crop is to be used. When sown in the spring, the white makes more hay or pasture the first fall than the yellow. For hay the second year the yellow is preferred because of its finer stems. One is about as valuable as the other for green manuring.

Fits Into Most Rotations

This versatile crop may be fitted into almost any rotation. If sown with oats, barley or wheat in the spring it will gain growth enough to pasture during late August and September or it may be cut for hay. The following year it may be pastured, cut for hay or silage, or it may be plowed under in the spring. Sweet clover may be followed in the rotation by any crop, but because of its soil building value any of the cultivated crops such as corn or potatoes respond best to the increased fertility. Truck growers who farm their land intensively often find it difficult to maintain the organic matter content of their soils. Sweet clover sown as a catch crop between the rows, late in the season and turned under the following spring helps them solve this problem successfully.

One of the most popular usages of this legume is pasture. Throughout New York State the hot, dry weather in July and August renders the average pasture practically worthless. Barn feeding

Happy New Year!

OF all wishes that might come true, there is no better one when it is really meant than a wish for happiness for ourselves and for our friends, for happiness is what we all seek.

It is easy to be happy when all goes well, but it takes character and courage still to see the silver lining, still to keep on smiling, when trouble comes.

To those to whom the past months have brought loss of loved ones, we extend the sympathy and wishes of the entire A.A. family; for them to be happy is especially difficult. Yet there is some small comfort in knowing that time itself eases the grief and helps one to smile again. You should remember, too, that those who are gone would not have you grieve.

To those who are made unhappy by the hard times, it may be said that much unhappiness may be avoided by keeping a sense of true proportion and a proper estimate of values. Even though there may not be quite as much money in the coming months as there has been in the past, still farm people will have enough to eat and wear, and a comfortable place in which to live. Most of them will still drive a car and listen to a radio and have all of the other modern blessings which our grandfathers got along without. Above all, nearly all of us will continue to be blessed with the associations and love of family and friends. What more do we need for a Happy New Year than these?

Farm Taxes Still Climb

THE yearly report made by Secretary Hyde of the Federal Department of Agriculture contains some very interesting statements about farm taxes. Land values and farm incomes went down in 1929, but farm taxes continued their merry old climb toward the sky.

"In 1928," says Secretary Hyde, "the real estate tax per acre for the country as a whole was five percent above the 1924 level. In 1929, it was seven percent above the 1924 average. Farm real estate taxes now equal the interest which farmers would pay at six percent on a mortgage indebtedness amounting to twenty-five percent of the full value of the real estate as compared with about eleven percent in 1913."

Numerous instances are known where the purchaser of a farm is required to pay taxes on a valuation higher than that actually paid for the farm and the tax assessors refuse to reduce the valuation on the tax books.

The Secretary of Agriculture recommends two remedies for the present excessive taxation of farm land: First, more effective control of county and township expenditures; and second, revision of the taxation system so that more revenue will

be derived from sources other than general property.

Fortunately, some progress has been made in a fight to control farm taxation in New York State, particularly on the second suggestion made above, to derive taxes from sources other than general property. Nearly all of the new road and school laws passed recently in New York State have tended to lift taxes off from farm property in the localities and put them on the State where the cities help to pay them.

However, it still remains for farmers and other local people to take note of the increasing tax expenses for county and township government. No one but the people living in the locality can change this local tax situation.

Build Up Parcel Post Service

THE recent appointment by the Post Office Department of a full time Director of Parcel Post will please all of those citizens who use this form of the mailing service extensively. It will be the chief duty of the new Director of Parcel Post to build up the volume, service, and efficiency of handling merchandise through the mails.

We hope, however, that this step in advance will not be more than offset by the proposal of the Postmaster General to increase parcel post rates. He has made such a proposal, but we understand that it is meeting with such a storm of protest that he may give it reconsideration and withdraw the suggestion. Certain it is that if the Federal Government really wants to be of practical help to the farmers, it will not add further to the farmers' burdens by increasing parcel post rates.

Experiences of City Consumers—

Buying Eggs

LAST week, we started this little series of relating some experiences from a consumer's standpoint in buying supplies for a city home, and told of the difficulties that we had had in trying to get good butter.

Let us now tell you what often happens when one tries to buy eggs in the city. It may be that there are consumers not as particular as we are, because we have lived on a farm, had our own poultry, and know what fresh eggs really are like. Unfortunately, it is extremely difficult to get such eggs when one lives in the city. We have tried the milk companies that will, if you wish, deliver eggs with the morning milk; we have tried the chain stores, and we have tried the parcel post way. None are satisfactory.

Getting eggs by parcel post has one big advantage—they are fresh. But from the consumer's standpoint, eggs cost more by parcel post, and there is considerable nuisance involved in returning the empty crates and in sending money or checks by mail.

One would think that either the chain stores or the big milk companies handling a great volume of eggs could give good quality, but we are sorry to say that the quality is not uniform nor the grades true to name. In brief, it has been our experience that with the exception of eggs received by parcel post, no matter what grade we buy, nor how much we pay, it is practically impossible to get eggs that are uniformly high in quality, in other words, that are strictly fresh. The result is that we buy very few eggs and there are hundreds of thousands of other consumers in exactly the same situation. It therefore follows that if some method can be devised to get fresh eggs to consumers at not too high a premium, the demand or consumption can be increased from ten to fifty percent.

As a matter of fact, a rather strange situation exists whereby eggs from the West, even California eggs, are often more reliable as to grade and freshness than our own produced in nearby sections. More care is taken by Western producers to gather the eggs frequently, grade and pack them carefully, and ship them under the right refrigerated conditions. We sometimes think that nearby producers are cursed by being too near the

market: it makes it possible to put culls on a market and to be careless in other ways than would be at all possible if they lived farther away.

We are greatly interested in the experiments being conducted by the G.L.F., in buying, grading, and packing eggs so as to get them into the market to give the consumer what he wants, when he wants it. If the G.L.F. can even partially solve this problem, it will mean much to both producers and consumers of eggs.

Save These Pictures of American Shrines

I have just received the December 13th issue of your publication showing the illustration of the old stone mill at Newport, R. I. I was born there and lived for twenty years of my life within a few blocks of this mill. There are several openings in the sides of the mill similar to windows, which are supposed to have been used for such or as places from which firearms could be discharged at enemies approaching it.

As boys we were told that if we ran around it twenty times, we would receive a visit from His Satanic Majesty, but I have tested this many times to no avail.

The old mill still stands as a monument of the earliest visit by hardy adventurers to this continent. The structure is valued beyond price by the native Newporters, and it will receive the utmost care and attention throughout the centuries that, I am sure, it will continue to stand.—G. C. C.

THIS is a sample of the many letters we are beginning to receive about our new series of covers, "Shrines of America." We believe this enthusiasm is justified, and we suggest again that you keep all of these beautiful old historical covers and make a scrap book of them, as they will extend over, when finished, the entire period of our American history.

Teachers and pupils particularly will find this suggestion valuable in making an interesting project in their history work.

Never Grows Old

"Age" does not detract from the readability of a farm paper. Carefully preserved in the Old Homestead beside the Nova Scotia coast are files of agricultural publications dating back to 1850. Perhaps some AMERICAN AGRICULTURISTS are among them."—A. L. M., New York.

IT is true that much of the material in a good farm paper does not grow old. This is one of the chief differences between a farm journal and other publications. You can save your copies for a week or a year and still profit by reading them. One of our most interesting pastimes when we have the time is to take down an old yellow-papered volume of AMERICAN AGRICULTURIST written and published before the Civil War and read the views and the articles written by the editors and contributors at that time. Much of it is just as interesting to-day as it was in 1850; a considerable portion of it is better and more carefully written than is the average farm paper to-day. There were not many pictures and the mechanical make-up of the paper was not as good as now, but after reading some of this material, we are always impressed that, with all of our boasted progress, most of us are no wiser to-day in those things which count the most than were our forefathers.

Eastman's Chestnut

TWO close-fisted Vermonters sued a neighbor for three hundred and seventy-five dollars owing on a land deal. They engaged the best lawyer in the county seat, and he won their case for them.

After the trial was over, the brothers called at their lawyer's office to inquire about the fee. One waited outside the office, while the other went in. "How much is it?" he asked abruptly.

"Well," said the lawyer, "I won't be hard on you. I have known both of you boys since you were children, and I knew your pa. I guess three hundred dollars will be about right."

The inquiring brother went out dazed. "Lordy, Jim," he said to the one outside, "I'm darn glad he didn't know grandpa too!"

Governor's Agricultural Commission Meets

Discusses Dirt Roads, Acts on City Markets and Reforestation

A SHORT time ago, Governor Franklin D. Roosevelt wrote to each member of his Agricultural Advisory Commission asking them to serve again on his Commission for the next two years. In the letter the Governor said:

"I do not think I need to tell you of my very great satisfaction with the excellent work of the Agricultural Advisory Commission appointed by me two years ago. To the fine results which have been obtained for the State you have largely contributed.

"I am asking the Commission as a whole to continue during my next term as Governor, and I, therefore, ask that you accept reappointment."

Everyone on the old Commission accepted the reappointment, and there were one or two new members added, as presidents of farm organizations who have been recently elected. A full list of the names of the members of the Commission, together with the organizations or institutions they represent, is given at the end of this discussion.

Henry Morgenthau, Jr., publisher of American Agriculturist, was also asked to continue as Chairman, and he called a meeting of the newly reappointed Commission which was held in Albany on Friday, December 19th. The purpose was to consider new farm and rural life suggestions for legislation during the coming session of the Legislature this winter.

The first subject to be brought before the Commission at this meeting was the problem of improving the dirt roads. It will be remembered that the Legislature last year passed the Pratt Bill equalizing State aid for dirt roads so that such roads in the majority of the towns of the State will receive as much as two or three times the aid that they had been getting under the old law.

Another step was also taken last year granting an appropriation to the Highway Department to conduct some experiments in different parts of the State to try to determine the best and cheapest methods of building improved roads to replace the dirt ones. This legislation has been described in detail several times in this publication. The new laws are a fine step forward on the dirt road problem, but, of course, are only a beginning.

Arthur W. Brandt, Commissioner of Highways, Department of Public Works, appeared before the Agricultural Commission at its meeting on December 19th and reviewed briefly the dirt road situation in New York State. He pointed out that there are at least 30,000 miles of dirt roads yet to be built, and emphasized the fact that a majority of our farmers still live on the dirt roads.

After Commissioner Brandt's discussion, a proposal was brought before the Commission to add another one cent to the gas tax and to devote this additional money entirely to dirt roads. If this sum were available, it is, of course, certain that immense progress could be made rapidly in pulling the dirt road farmers out of the mud in every county. The proposal was so important, however, that the Commission felt that it should study it more at length before making a definite recommendation.

The next subject to be brought forward for discussion was that of establishing regional markets for the benefit of both producers and consumers in the large cities of the

State. Commissioner Berne A. Pyrke of the State Department of Agriculture and Markets outlined the need of such markets. He told of studies and investigations that have been made for years by representatives of his Department, and of the work of a marketing committee headed by G. F. Warren of Cornell University to find out the best method of establishing city markets. Dr. Warren and others also spoke at length on the problem.

On the day before the meeting of the Commission a conference was held and was attended by a large number of men interested in the city marketing situation, men who had made a special study of this problem for years. This conference adopted several resolutions, and on the next day, a report of this conference and the resolutions adopted was brought before the Agricultural Commission. After much discussion, the following motion containing the chief recommendation of the marketing conference was approved by the Agricultural Commission:

WHEREAS, there is an acute need for the establishment of a comprehensive state-wide system of regional food markets to provide suitable outlets for the products of the farms of the State and to decrease food costs to consumers.

BE IT RESOLVED, that such markets should be state owned and state controlled, that there should be appropriated sufficient funds for the establishment of the first of such markets and that the De-

partment of Agriculture and Markets be authorized to select the site for such first market.

Private Versus Public Ownership

There was considerable discussion on the point of state ownership and control of markets, many feeling that if any other method could be found it would be unwise for the State to enter into this business. It was agreed, however, that there was no other answer to the problem; that private interests would not come forward and establish these city markets, and that, if they did, they could not be controlled for the interests of producers and consumers. The present Buffalo situation was cited as a bad example of what might happen where private interests tried to meet the problem. In Buffalo, as we have explained before in these columns, there are two large markets now being erected at great expense. One of these markets must eventually fail.

Municipal or government ownership and control of city markets is not a new proposal. Most of such markets are so operated at present. State control, however, is much better, particularly from the farmers' standpoint, because under city control, producers usually have no representation.

The editors of American Agriculturist look upon this work as one of the most important things that can be done for the farmers of this State. These city markets extend out to producers as far as one hundred and fifty miles, and if an efficient market of this kind is established eventually in all of the cities, it will go a long way towards solving the marketing problem.

Importance of Soil and Reforestation Surveys

Not the least important of the problems considered by the Commission on its first meeting this season was that of agricultural soil survey. To refresh your memory on this subject, you will recall that last year the Agricultural Commission recommended that an appropriation of \$96,000 be made by the Legislature to complete the soil survey very quickly in every county of the State. The thought is to make it possible to adapt the best farm enterprises to the best types of soil and to make it impossible for a farmer to waste thousands of dollars and years of his life, for example, in planting an orchard on soil where it never can succeed, and also to determine the lands of the State that should not grow crops at all but should be either used for reforestation or for parks and other recreational purposes. The bill was finally passed, but the State found it necessary because of lack of funds to cut the appropriation to \$20,000.

With this smaller amount, the State College, under the direction of Dr. George F. Warren, began a study and a survey, and some progress has already been made which was reported by Dr. Warren to the Commission at its December 19th meeting. The survey is of importance to every rural resident, not only because it includes the problem of the use of land, but takes in also such questions as the proper development of farm-to-market roads and rural electrification. The whole problem of State reforestation is also involved in this program. In fact, Chairman Morgenthau

(Continued on Page 18)

Judges Name Eleven New York State Master Farmers

ON December 18, the Board of New York State Master Farmer Judges were dinner guests of the Governor at the Executive Mansion in Albany, after which they named eleven New York State Master Farmers for 1930. These men are:

Charles Riley	Sennett	Cayuga
George W. Lamb	Hubbardsville	Madison
Frank Carter	Marathon	Cortland
George B. LaMont	Albion	Orleans
S. H. Merchant	Burnt Hills	Saratoga
Fred Hollowell	Penn Yan	Yates
Peter Vercrouse	Oswego	Oswego
Hugh Humphreys	New Hartford	Oneida
Millard Hinchey	Morton	Monroe
J. D. Amele	Williamson	Wayne
Thomas Marks	Wilson	Niagara

The Master Farmer banquet this year will be held on February 12, during Farmers' Week at Ithaca. At the banquet, Governor Roosevelt will personally present, to these men, the Master Farmer medals which have been awarded by American Agriculturist.

The following are the busy men who are so interested in the Master Farmer project that they find time each year to serve on the Board of Judges: Commissioner Berne A. Pyrke, Department of Agriculture and Markets; Dr. C. E. Ladd, Director of Extension, New York State College of Agriculture; Dr. A. R. Mann, Dean, New York State College of Agriculture; Assemblyman Frank M. Smith; Senator L. G. Kirkland; Fred J. Freestone, Master New York State Grange; M. C. Burritt, Public Service Commission; Henry Morgenthau, Jr., Publisher, American Agriculturist; E. R. Eastman, Editor, American Agriculturist.

In addition to honoring Master Farmers this year, American Agriculturist is also giving recognition to six young farm folks. Two of these are students of vocational agriculture in New York State high schools. Present at the dinner and meeting were Arthur K. Getman and W. J. Weaver, supervisors of high school vocational agriculture, who cooperated in selecting two young men for this honor. They are:

Nattie Eastman	Portville	Cattaraugus County
William Allen	Marathon	Cortland County

Mr. O. H. Benson, director of rural scouting of the Boy Scouts of America, has cooperated with American Agriculturist in getting nominations of outstanding farm Boy Scouts. He presented the names and records of a number of Scouts to the Board of Judges. Those chosen for recognition were:

Allman Culbertson	Dansville	Livingston County
Clinton Stimson	Spencer	Tioga County

The other group of young folks recognized were 4-H Club workers. Professor W. J. Wright, State Leader of 4-H Club work, gave to the Board of Judges the accomplishments of several boys and girls who have achieved unusual results. From them the Board of Judges selected one girl and one boy as follows:

Mary Carley	Manlius	Onondaga County
Theodore Hubbard	Brisben	Chenango County

These six young people will attend the Master Farmer banquet and at that time will be personally congratulated by the Governor for their achievements and presented with a medal to be known as the "Four A Achievement Award", an abbreviation of "American Agriculturist Achievement Award".

Growing Brussels Sprouts

I would like some information on growing brussels sprouts. Our top soil is mostly black and stony. Our bottom soil is blue clay or hard pan.

1. Can brussels sprouts be grown on such ground?
2. How heavy a frost can they stand?
3. How much fertilizer should I use?
4. Would it be profitable to use mulch paper?
5. What is the average yield per acre?
6. Are they hard to raise?
7. Could a person keep them in a cellar for winter market?

In fact, I would like all the information about them that I can get.—A. K., N. Y.

BRUSSELS sprouts grow on a fairly wide variety of soils. If the dark color of your soil is traceable to a large humus content, should think it would be suitable. I do not believe that stones, in reasonable amounts, would interfere.

Brussels sprouts are quite hardy and they can be left in the field fairly late in the fall. I do not know of any experiment with mulch paper for this crop.

Brussels sprouts plants are often taken from the field, and stored in cellars or insulated storage above ground where they will not freeze very hard. They are then taken out and trimmed for market during the winter up until as late as February.

The brussels sprouts crop is not particularly hard to raise, but like other things, there is a good deal to learn about it and one will find it necessary to master the details. The quality of seed is perhaps as important a point as any. I would suggest that you secure some good Long Island stock.—Paul Work.

Wire Worms and White Grubs

What can we do to lessen the trouble from wire worms and white grubs?

THESE are pests which are worse on land that has been in grass for several years. Following a short rotation with the land in sod not over two years does as much as anything to remedy this trouble. It takes three years for these insects to complete their life history. They live on grass roots and when the grass is plowed under they become very serious pests of many crops, particularly potatoes.

There is no chemical which can be profitably applied that will control these pests.

Nitrogen for Cauliflower

ONE of the troubles which cauliflower growers have is the development of small heads which are not at all marketable. The New Jersey Experiment Station has done some work in trying to prevent this and appear to have solved the difficulty. They state

that any condition which favors the development of starch in a plant and which slows up the development of protein, slows up the growth of the whole plant as well as the development of

An unmarketable head of cauliflower.

flowers and seeds, or in this case, the development of a marketable head.

More directly it seems that lack of nitrogen in the soil is one of the chief causes of "buttoning" of cauliflower heads. Even though nitrates are present a very low temperature in the early stages of growth may prevent the proper intake of nitrogen and so

This kind pleases the consumer and gives the grower a profit.

the result of unmarketable heads. The picture of the desirable head shows the result of an abundance of nitrates, plenty of moisture, and proper temperatures. The small unmarketable head shows the result of unfavorable growth conditions.

Growers Plant Potatoes Closer

WINNERS in most of the 300 bushel potato contests have adopted the plan of planting the seed closer together in the row. The last three years has seen the growers in New Jersey changing from a 14-inch spacing down to 11 and 12 inches. Those who have made a close study of planting distances claim that they are able to grow a more uniform product and secured a much larger number of potatoes from the same amount of ground. It requires two or six bushels more seed to plant each acre, but the total bushels of marketable potatoes pays handsome returns on the investment. They have also discovered that the extra 25 to 75 bushels of potatoes have been grown with the same amount of fertilizer.—A. K.

Burpee's Seeds Grow

Burpee's Annual abounds in interesting planting information and offers valuable suggestions as to the best and most profitable varieties to grow. It is an interesting book of 144 pages, with many of the leading Vegetables and Flowers illustrated in color.

New Vegetables and Flowers

Read about Burpee's new "Tangerine" Tomato, Burpeeana Cauliflower, that won the National Cauliflower Contest, Sweet Peas, Dahlias, etc. Burpee's Annual will be mailed free.

Pruning Young Trees

DURING this winter thousands of young apple trees will be pruned for the first time. What should be the aim of the orchardist who does this work? First, orchardists are coming to believe that young trees should be pruned very little for the first few years of bearing. If limbs cross each other, one of them can be cut out and a certain amount of training can be done to secure a well-shaped top, but beyond this the less done the better.

Pruning is a dwarfing process and it has been definitely established at several experiment stations that trees that are pruned heavily year after year require several more years to come into bearing than those that are pruned lightly.

The second point is that some authorities, at least, believe that what pruning is done should consist of an evening out of the top rather than a cutting back of all the branches. Heading back merely stimulates growth at the point of the cut and increases the thickness of the head.

Manure for Apple Trees

Where manure is used in the orchard, how close should it be spread to the trunks of 17-year old trees?

IT should always be remembered that the roots of a tree spread out just as far as the top and usually the feeding roots are more numerous along the edge of this circle than they are close to the trunk. It is not advisable to put manure nearer than three feet to the trunk of trees and it should be spread all around under the branches, perhaps even beyond the area covered by the branches.

Dry Summer Shows Need for Humus

THE unusually dry summer of 1930 has emphasized the need of having an orchard soil that will retain moisture. The following suggestions are given by M. A. Blake of the New Jersey College:

First—A naturally good soil should be chosen. Some soils are deep and act as good reservoirs of soil moisture. A surface soil of eight or ten inches deep is advisable, although five or six inches may prove satisfactory if the sub-soil is favorable.

Trees will dry out if their roots stand for any considerable period of time in a water soaked soil. The addition of organic matter will greatly improve the water holding capacity of the soil. However, where the surface soil is thin and the sub-soil is heavy, little benefit will be secured from discing in a cover crop which mixes organic matter only with the top three or four inches of soil. It is important to increase depth to what organic matter is added.

In conclusion, Professor Blake sug-

gests that the orchard soil should be examined and that the owner should note the depth of the surface soil to determine whether or not the depth of cultivation should be increased. At any rate, the problem is to introduce organic matter deeper and deeper into the sub-soil to provide an adequate water reservoir for dry seasons that are sure to come.

Inferior Fruit Hurts Market

Is it not true that holding McIntosh until late in the season and then putting them on the market has a tendency to injure the future market for this variety?

CERTAINLY McIntosh does not keep perfectly as late as March. The quality at that time, of course, would depend upon the fruit when it went into storage, but in general it seems certain that putting inferior quality fruit on the market hurts the market for that variety.

Pollinators for Baldwins

Would it pay us to pull out some of the trees in a solid block of Baldwins and put in other varieties in order to get cross pollination?

IT is pretty definitely established that you will get a better crop of Baldwins if they can be cross pollinated. However it is not absolutely necessary to pull out your Baldwins. You can top work some of them to other varieties which will be fully as quick as setting in new trees. Good pollinators for Baldwins are McIntosh, Cortland, Rome, Delicious and Northern Spy. Of course, Northern Spy does not come into bearing very early and this should be considered when using it as a cross pollinator.

Controlling Water Sprouts

Is it possible to prevent excessive growth of water sprouts on all apple trees that need to be heavily pruned?

WHILE there is probably no way of preventing the growth of water sprouts, they can be removed sometime during the summer when they are still small. In this way they will do little damage and probably will not come back the coming year.

Peach Varieties

How would you compare the South Haven with the Elberta peaches, in market variety?

MOST people agree that the Elberta is the better variety but of course the South Haven ripens earlier which is oftentimes an advantage so far as price is concerned. The South Haven is usually smaller and is a poorer shipper than the Elberta.

ORCHARDISTS should not confuse Sunoco Self-Emulsifying Spray with engine oil emulsions and other petroleum spray products now on the market.

Experiment station tests and experiences of growers have shown remarkable differences in results.

Sunoco Spray, a distilled product, runs uniform, while many other petroleum spray formulas have been changed from year to year.

100% and 98.5/10% control of the San Jose Scale with the Sunoco Spray during the outbreak in Indiana orchards was reported by Professor J. J. Davis, Entomologist, Purdue (Indiana) Agricultural Experiment Station.

Hundreds of leading fruit growers are regular users of Sunoco Spray. There must be good reasons. Mail the coupon today for literature.

SCALE INSECTS are menacing orchardists this year, having multiplied enormously due to an extremely long warm season and the lack of dashing rains which destroy the young "crawlers" after hatching. Most of the scales in each brood grew to maturity.

New Portable MILKER

High-speed, Low-vacuum

The only milker entirely on wheels. No installing—no pipes—no pulsator—no valves—no complex teat cups. So simple a child can operate. Nothing to carry. The least to clean. Truly sanitary. Visible milk flow. The lowest power and upkeep cost of any milker. Milk two, three, or four cows at once right into the shipping can. High speed—faster milking—yet less vacuum on teats. It is soothing to cows. Now a perfect milker. Guaranteed 10 yrs. Electric, Engine, or Hand Milker.

5 down after FREE TRIAL

Try this GUARANTEED new milker—any model at our risk. Comes complete. Just wheel it in and start milking. Pay us nothing down—not a cent until after free trial—and then only if you decide to keep it. We'll take the risk on you as we have on thousands of enthusiastic satisfied users.

14 Months to Pay

If you're delighted—thoroughly satisfied—after trial, then send \$5 and balance small, easy monthly payments. All Page milkers, engine or motor included, are remarkably inexpensive, and besides, we'll allow you agent's price. We can allow agent's price and free trial only until we have an agent or salesman in your locality so, WRITE at once.

Free Book on Milkers

36 page illustrated book explains everything. Find out how, as demonstrating agent (no canvassing), you can earn extra money and also have your purchase price refunded. Write to BURTON PAGE CO., Dept. 2111, 537 South Dearborn St., CHICAGO

UNADILLA SILOS

Made Famous by the Men Who Own Them

Every dollar put into a Unadilla—both in roughage and construction—comes back to you many times during its long life. That's why successful dairymen praise the Unadilla and buy it again and again. If you aim to make more money in dairying, and to pay the least for the most convenience and service—buy a Unadilla—the safest, strongest, most efficient silo of them all.

Should Grade Cows Be Registered?

SHOULD grade cows producing specified large amounts of milk or butter fat be registered?

My opinion upon this subject is that grade cows should not be registered under any conditions, for the following reasons:

1. The grade cow cannot be depended upon to transmit her characters as to production or individuality with any desirable degree of uniformity, whereas the present supply of registered, purebred cattle offers scores of blood lines bred for generations to transmit certain characters, which they do uniformly

thing. Breed type and character go hand in hand with the breeding of superior, purebred animals, as well as ability to transmit production.

5. The grade cow is already receiving all the recognition that is due her through the cow testing associations. High producing grades compared with purebred scrubs tend to discredit the whole purebred business in the eyes of some dairymen, even though breed associations cancel certificates of registered cows when low producing ability has been demonstrated.

6. Purebreds on the average are superior to grades in every way. Statistical study will prove this point. Registration of grades would add nothing to the dairy industry, and might very likely injure it a great deal.

7. Attempts to build a registered herd from grade stock would be a step backward many years, even to the beginning of the breed, and would require the same laborious steps which have been taken years ago by purebred breeders to establish the dairy breeds in their present high position.

8. The purebred breeder has rendered a great service to the entire dairy industry, and should be protected from competition with grade stock of somewhat uncertain quality and origin—W. WALLACE BEACH, *Apalachin, N. Y.*

What Is Your Opinion?

IN a recent issue we suggested registration for grade cows that meet certain standards. We asked for letters from dairymen and have received many. We are publishing a few of them and, as you will see, they present decidedly different opinions.

We believe there is much merit in our original suggestion. Perhaps it would not be wise to register these grades and call them purebreds, but would it not be comparatively simple to publish a supplementary herd book for grade animals who are exceptionally high producers? This might well be restricted to cows as there are plenty of excellent purebred bulls if we will merely keep the records necessary to identify them. After reading the letters on this page why not sit down and write us your opinion?

Use Herd Improvement Records

I DO not know of any attempt here or abroad in organizing an association of grade cow registry.

Personally I am against the idea and for these reasons.

1. Production records of grades are already taken care of in the Dairy Herd Improvement Association reports, and also in the Proven Sire work.

2. There is an honor roll of breeders in existence where the average is 300 lbs. or above. I believe the National Dairy Association, St. Louis, Missouri, publishes this honor roll.

3. I am distinctly in favor of having brought together each year, perhaps by our Professor S. J. Brownell, here at the College, the Dairy Herd Improvement Association records of all the grade cows that have produced 400 lbs. of fat in a year as a mature cow. We figure two-year-olds at 70 percent of this, or 280 lbs. of fat; three-year-olds at 80 percent or 320 lbs. of fat; and four-year-olds at 90 percent or 360 lbs. of fat. A five-year-old is declared mature and she would be required to produce 400 lbs. of fat, or if she is older than five years the amount required would be 400 lbs. of fat. I think it would be a fine thing if the College of Agriculture in each state would bring together each year the name of the owner, his address, the number of grade cows that he has that have Dairy Herd

(Continued on Opposite Page)

"Git up! It's five o'clock! Early to bed and early to rise—that's been my motto!"—LIFE.

Ever look into a cow's stomach?

Of course not! But if it were possible you would be amazed at what goes on there!

You'd rush to the nearest feed store for Dried Molasses Beet Pulp—the natural vegetable feed resulting from the extraction of sugar from beets—the feed that keeps the cow's stomach in perfect working order. In addition to being a great feed itself it aids the digestion of the other ingredients in the ration.

Dried Molasses Beet Pulp is **bulky, cooling, laxative, palatable**—just the kind of feed every cow needs in her stomach to keep in perfect health. And your cows must be healthy to be profitable. Fits any ration—replaces corn, barley, oats, silage and other carbohydrate feeds. 6 pounds are equal to 10 pounds of hay. Good for all animals—dairy cows, beef cattle and sheep.

Attractive Prices

Present low prices make it more than ever a profitable buy. See your feed dealer without delay. Shipments made direct from factory closest to buyer.

Send for Free Booklet, "Profitable Feeding"

When Writing Advertisers, Be Sure to Mention American Agriculturist

(Continued from Opposite Page)

Improvement Association records of 400 lbs. of fat or its equivalent in cows under maturity. The name of the cow and her ear tag number should be given and the name of her sire. In this way we would have a record in each state which would be useful in giving credit to the owners who are able to breed these kinds of cows and able to feed them out. Also we would have records that could be traced so far as the production of proven hires is concerned.

I do not think there would be very much good coming from the registry of a particular grade cow. I think that the value would come in proven sire work and in giving credit to the men who own such cows. To sum up, an annual report of Dairy Herd Improvement Association work in each state giving certain data for each individual cow I think would cover this matter very nicely. Of course, you could go from this to a national association bringing together all of these reports. Such a report could be made by the United States Department of Agriculture. I think this would be money well expended in our extension work in the several states and in the United States Department of Agriculture through the Dairy Herd Improvement Associations without its costing the individual farmer any money at all. What do you think of this?—E. S. SAVAGE, New York State College of Agriculture.

Believes Plan Is Feasible

I HAVE no information in regard to any system of registering grade cows in Holland, as I have not given the matter much attention since I was in Holland many years ago. Of course the grade animal as we understand her in this country is practically non-existent there as all the animals are of the same type or breed. Until recently and possibly even yet so called "foundation" animals are admitted to the herd book under certain standards of examination and production.

With regard to the registration of grade animals in this country, I do not see why such a plan as you outline is not feasible. It could easily be worked out in connection with dairy improvement associations and would give the animals so recorded a standing that would be of pecuniary advantage to their owners. However the chief usefulness of herd book registration is that it implies that the offspring of animals so recorded are thereby themselves eligible to registration. And there are very few grade animals to whom most people would be willing to grant such a distinction.—HENRY H. WING, President, Holstein Friesian Association of America.

Poor Purebreds Should Not Be Registered

DAIRYMEN for sometime have been developing dairy cattle in an endeavor to transmit certain qualities. It is true that a good many purebreds are not worth keeping. Consequently, I think every female should have at least a year's record before being registered. In such a system the requirements could be met by a certain amount of milk and fat. The calves raised would be from the better cows and each succeeding generation would be as good or even better perhaps than their dams. A few high producing cows do not transmit qualities to their offspring. As a result we have low producing purebreds. This is also true of the good grade cow. She has not been tested and followed up as closely as the purebred. Of course the testing associations have the figures which prove and classify the outstanding cows eligible for registry.

We have both grades and purebreds. Some are good producers and some are not. I have just recently joined a dairy record club, so will undoubtedly cull out some of my herd in time. When buying a new herd sire, I shall attempt to get a line of breeding which is able to transmit good production qualities. A grade cow registered with purebreds having this ability might not possess this quality. Therefore, I deem it wiser to form separate associations for the purebreds and grades instead of registering the latter in the same book.—IRVING H. WHEAT, Hamden, N. Y.

Every Cow

must pay a profit in 1931

DAIRY RATION

To feed with Alfalfa Hay and Corn Silage
Ground Corn, Hominy, or Barley.... 300 lbs.
Ground Oats 300 lbs.
Wheat Bran..... 100 lbs.
Linseed Meal..... 100 lbs.
If you use ready-mixed dairy feed, replace the Linseed Meal and Wheat Bran with 250 lbs. of good 20% feed. Look on the label for Linseed Meal.

pocket if you feed according to production.

With the right amount of protein-rich Linseed Meal, your home-grown feeds will go farther, and enable any real milker to produce milk at a profit.

Here's the tried and proved plan:

Start out in January with a **Balanced Ration**. The right way is to balance home-grown feeds with Linseed Meal or a good ready-mixed feed containing Linseed Meal—the old reliable protein supplement. The ration above is an example of the kind of mixture to use. The Linseed Meal Chart of Balanced Rations gives you the right grain mixtures to use with other roughages.

Save feed by feeding according to production. You can make your short supply of feed last longer and put more money in your

Keep accurate records. Weigh the feed. Weigh the milk. Keep records. Then you can figure the profit every cow is making for you. And you can be sure your herd is on a money-making basis.

The Linseed Meal Book "Feeding for Profit" explains the modern method of making money with dairy cows—the same method that is taught by Dairy Herd Improvement Associations and Agricultural Colleges. Free wall chart gives balanced rations for all farm animals. Mail the coupon for free Chart and Book.

New Price Schedule Attractive

We have just built a new Grange factory and opened two new Eastern offices to care for ever-increasing volume and give still lower costs through increased production.

Factory at Nelson, N. J. (on D. L. & W. midway between N. Y. C. and Phila.)
Offices at Hackettstown, N. J. and Springfield, Mass.

Big savings in freight, production and erection costs, plus quicker service, "on time" delivery, etc. will mean much to silo purchasers this year when lower costs are needed. Write at once for our new schedule of prices on Grange Silos—Concrete Stave or Wood. Exclusive features. Free catalog.

New Jersey dairymen write direct to us at Hackettstown, N. J.
New England dairymen write direct to us at 108 Garfield St., Springfield, Mass.

Milk Prices

December Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

	Class	Dairymen's League	Sheffield Producers
1	Fluid Milk	3.37	3.17
2	Fluid Cream		1.70
2A	Fluid Cream	1.86	
2B	Cond. Milk		
3	Soft Cheese	2.11	
3	Evap. Cond.		
	Milk Powder		
	Hard Cheese	1.90	1.60
4	Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for December 1929 was \$3.42 for 3.5% milk and Sheffield's \$3.22 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Sinks Lower

CREAMERY SALTED	Dec. 26, 1930	Dec. 19, 1930	Dec. 27, 1929
Higher than extra	29 1/2-30	30 1/2-31	40 1/2-41
Extra (92 sc.)	29 - 30	30 - 40	-
84-91 score	24 - 28 1/2	24 - 28 3/4	31 1/2-39 1/2
Lower Grades	23 - 23 1/2	23 - 23 1/2	29 1/2-30 1/2

The lull in business following the buying for holiday needs, carried the market to new low levels. After buyers had satisfied their needs for the Christmas trade, it was difficult to find a satisfactory outlet for the steadily increasing supplies, and as a result lower levels were tried in order to find outlets. Butter prices are now the lowest they have been for December in twenty years. The last time prices hit this low level was in May 1921.

On Monday, the market was very unsettled and before the morning was over creamery extras had slipped to 30c, a 1/2c drop under Saturday's quoted price. Receipts on Monday were liberal and this added to the withdrawal of buying support and brought about the decline, in spite of the fact that Chicago's spot values were above par with New York. Holiday buying was over on Tuesday and with plenty of butter available prices slipped to 29 1/2c. There was heavy pressure on the selling side as dull business was expected over the holiday. Even at the lower price level buyers were not taking hold very freely. The situation continued on Wednesday with growing anxiety among the receivers following advice that liberal arrivals were expected at the end of the week. On Friday, the market opened in an easy condition with plenty of fancy butter on hand. Increased pressure to sell cut values another 1/2c. At the decline buying interest broadened but it was chiefly of a hand to mouth character. There was no definite strength to the undertone. This is being written on the 27th and at the moment we do not know what will happen to the market. A heavy snow is falling and if it is general over the East (and radio reports say it is) it is bound to delay traffic and hold up some of the incoming supplies. This will undoubtedly strengthen prices temporarily. However, a snowstorm cannot change the fundamental difficulty which is "too much butter."

The over-supply of butter appears to be coming from an increased current make. Storage holdings are not burdensome. At the middle of December the holdings in the four largest markets were approximately 7,500,000 pounds short of the holdings at the same time last year. During the third week in December the out of storage movement was slightly heavier than it was during the same period last year. It appears that the current make of butter is responsible for much of the over-supply. At the same time, the unsatisfactory industrial conditions with the accompanying unemployment situation seriously interfere with the consumer demand in New York City.

Cheese Market Very Quiet

STATE FLATS	Dec. 26, 1930	Dec. 19, 1930	Dec. 27, 1929
Fresh Fancy	19-20	19-20	22 -
Fresh Average			21 -
Held Fancy			26 - 26 1/2
Held Average			23 1/2-24 1/2

The cheese market in New York has been extremely quiet during the past week. Fresh makes are meeting very little local demand. Fortunately, not a great deal of fresh cheese is coming forward, and therefore, there is not any extreme pressure to sell. As we have said before in these columns, if a sudden flood of fresh cheese were to hit New York the whole business would collapse. Cured cheese appears to be plentiful. In some

cases cured cheese is being offered at some concessions under top quotations.

Statistically, the cheese market is in fairly good shape compared with holdings a year ago. At mid-December holdings in the ten cities making daily reports were approximately 2,400,000 pounds under the holdings at the same time a year ago.

Brown Eggs Scarce

NEARBY WHITE	Dec. 26, 1930	Dec. 19, 1930	Dec. 27, 1929
Hennery	1930	1930	1930
Selected Extras	36-37 1/2	34-37 1/2	57-58
Average Extras	34-35	31-33	55-
Extra Firsts	32-33	28-30	54
Firsts	29-30	26-27	-
Undergrades			
Pullets	22-24	20-21	48-49
Pewees		17-19	-
NEARBY BROWNS	Dec. 26, 1930	Dec. 19, 1930	Dec. 27, 1929
Hennery	41-43	36-39	57-58
Gathered	31-40	26-35	56

The feature of the egg market this week was the acute shortage of fancy nearby brown eggs. They are bringing 6 1/2c above closely selected whites. White eggs also are selling better of late, the price improvement coming in the grades just below the top marks. Mrs. John H. Housewife is the individual who is responsible for the high water mark going no higher. When prices get above a certain level these days people simply stop buying and take to the cheaper grades. It is a condition that exists when industrial conditions are bad. As we are writing this report a heavy snow storm is laying down a blanket over the Metropolitan district and if past performances can be used as an indication the market is going to experience continued shortage and we will undoubtedly see advancing prices. Traffic tie-ups, etc. will undoubtedly interfere with the movement of goods coming into New York. Whether or not it has any effect on production remains to be seen.

Statistically, the market is much better than it was several months ago. At mid-December the ten cities making daily reports held only 700,000 cases, approximately, in excess of the reserves they held a year ago. Of late consumptive demand has been much better due to the fact that retail prices are now more in line with the wholesale market. This is going to help the statistical condition of the market. The recent improvement has had a beneficial effect on the refrigerator trade which gives the outlook just a little brighter aspect.

Good Holiday Market for Poultry

	Dec. 26, 1930	Dec. 19, 1930	Dec. 27, 1929
FOWLS	1930	1930	1929

DUCKS, Nearby	24-28	21-25	24
GEISE	18-22	17-20	22-24

Generally speaking the live poultry market for the Christmas holiday proved satisfactory. Stock cleared up well and prices ruled steady. On Monday, fowls were a little quiet with the exception of a few extra fancy colored birds that brought up to 24c. Fancy colored chickens sold up to 28c and fancy broilers were bringing 45c. As a matter of fact there was a shortage of fancy broilers and prices soon climbed to 50c at which figure trade began to slacken because people would not pay the price. Turkeys hit 40c on Monday but from then on they did not do so well and steadily lost ground finally winding up at 25c to 30c. As we advised our readers earlier those who got their stock in on Monday, got the price. Those who waited for late Tuesday and Wednesday lost out. Ducks have sold well, as can be judged from the price columns above. Geese have also been getting good prices. Some fancy farm batted stock selling as high as 24c. A feature of the poultry market just before the holiday was the slow movement of turkeys out of some retail stores. As a result we do not look for any improvement for the New Year market. Many people tire of poultry at the New Year and swing to roast pork.

Potato Market Steady

The market on Maine potatoes has been steady to firm with prices just a shade higher. Heavy snow storms are expected to delay arrivals and interfere with the

Fruits and Vegetables

We would not be surprised to see some improvement in the apple market after the holidays are over. Offerings of apples in barrels and baskets have been light and it would not surprise us to see values gain.

Prices of State cabbage are showing some improvement with prices ranging from \$20 to \$24 per ton.

Supplies of State celery have been light and the market holds at \$1.50 to \$2.25 per crate. Hearts are bringing from \$1 to \$1.50 per dozen bunches.

Parsnips are quoted at 60c to 75c per basket and \$2 to \$2.25 per barrel.

Nearby Marrow squash has been bringing from \$1.25 to \$1.50 per barrel, while Hubbards have been bringing up to \$1.75. Some Western Hubbards have been bringing \$2.

The movement of onions has been just about fair. Western New York yellows have been bringing from \$1.15 to \$1.25 per hundred, while Orange County yellows have been bringing from \$1 to \$1.40. Orange County boiler whites have been bringing from \$1 to \$1.50 per 50 pound bag, while regular whites are worth from 85c to \$1 per 50 pound bag.

Meats and Livestock

CATTLE—Steers, best lines have been bringing from \$9 to \$10.25 per hundred; common to good stock \$7 to \$8.50. Bulls—grading heavy \$5.75 to \$6.25; light to medium \$4.25 to \$5.50. Heavy cows—\$5.50 to \$6.75; medium \$4 to \$5; light \$2 to \$3.50 per hundred.

VEALERS meeting active trade; market firm and higher. Prime veal \$12 to \$13.50; fair to good \$10.50 to \$11.50; common to medium \$8 to \$10.25; culls \$6 to \$7.50.

LAMBS firm and higher. Spring lamb 100 lbs. \$8 to \$9.25; culls \$5.50 to \$7.

HOGS generally bring from \$8 to \$8.75; Roughs \$4 to \$7.75.

Country dressed veal has been in excessive supply and the market has been very weak. There were quite a few carry-overs over the holiday and receipts were liberal as the market opened on Friday. By this time trade for the week is pretty well over and it looks like heavy carry-overs for Monday. It is doubtful if the present price of 12c to 13c for the best will be able to hold. At these prices it does not pay to dress calves in the country.

Dressed hothouse lambs cleaned up pretty well and on Friday the market was firm with some premiums being paid. Prices ranged from \$6 to \$9 with imitations at \$2 to \$5.

Dressed roasting pigs met an excellent market and cleaned up very well. On Friday the market was firm with prices unchanged, ranging from 16c to 25c depending on weight.

Rabbits have been selling fairly well at 18c to 25c.

Hay Market Quiet

The hay market received little or no attention over the holiday. The hay market is usually extremely dull at this time of year. Prices are about the same as last quoted, in some cases outside prices being a little extreme.

The Christmas tree market went to smithereens just before the market closed on Christmas eve. Trees that formerly were held for \$1 were being peddled out for 50c. In fact all kinds of Christmas greens suffered a decline toward the end. It appeared that people were looking upon them as not so essential, spending their money for food and clothing.

The Christmas tree deal is a hard one to foresee. Some years prices wind up sky high, other years they blow up or down and then go to pieces.

When buying hydrated lime for whitewash insist on having the freshest lime that is available.

Farm News from New York

Many Important Meetings Scheduled in January---News Writing Contest

A NUMBER of important farm meetings are scheduled for the near future. On January 7 and 8, the State Vegetable Growers' Association meets at Syracuse. At the same time and place there will be a meeting of the Empire State Potato Club.

On January 8 and 9, the New York Nurserymen's Association meets at Rochester.

On January 14, 15, and 16, the New York State Horticultural Society has its annual meeting at Rochester.

On January 28, 29, and 30, the New York Horticultural Society will have its annual eastern New York meeting at Poughkeepsie.

On January 21, the New York State Agricultural Society will have its 99th annual meeting in the Assembly Parlor of the State Capitol. Governor Franklin D. Roosevelt will be a guest and speaker at the old-fashioned supper which has become an important annual event.

On January 22, the New York Dairy-men's Association and the New York Breeders' Association will have their annual meetings at Albany, and on January 23, the State Guernsey Breeders' Association will meet.

On February 2 to 5, the State Grange will have its annual convention at Olean.

Last, but not least, on the list, on February 9 to 14, the State College of Agriculture will have its twenty-fourth annual Farm and Home Week at Ithaca. Among the many important events will be the Master Farmer banquet at which Governor Roosevelt will present Master Farmer medals to eleven New York State farmers and Four A Achievement Awards to six young folks living on farms.

Central School Districts Organize Association

AT the recent meeting at Syracuse, of representatives of Central Rural School Districts in New York State a permanent organization was formed, to be known as the Association of Central Rural School District Boards. Officers elected were: Robert L. Oaks, North Rose, N. Y., President; Pierce W. Stevens, Greenville, N. Y., Vice-President, and H. P. Aikman, Cazenovia, N. Y., Secy-Treas.

An executive committee of four members was elected as follows: Enos Lee of Yorktown Heights, elected for two years; Orrin Terry of Waterville, elected for two years; Thur Smith of Newark Valley, elected for one year; and Thomas Fife of Madrid, elected for one year.

State Institution Farmers Attend Institute

ON December 16 to 18, inclusive, farm workers at New York State institutions met at the DeWitt Clinton Hotel, Albany, for a Farmers' Institute. During the three days' program, talks were given on many farm subjects, including dairying, potato growing, and vegetable growing, as well as a number of general talks on the agricultural situation.

Tuesday evening, at 6:30 P. M., there was an annual banquet for those attending.

Mr. C. H. Baldwin of the State Department of Agriculture has charge of State Institution Farms.

Aberdeen-Angus Have Good Year

THE figures presented by Secretary Tomhave of the American Aberdeen-Angus Breeders' Association at the annual meeting held early in December covering the work of this Association for the fiscal year ending October 31, 1930 show splendid progress for this breed.

Total applications for registry received during the year were 10,852 compared with 10,792 for the same period in 1929. Transfers recorded were 8,182 or an increase of 11.6% over 1929. 117 new members joined the Association during the year. These new members are located in 30 different states. Iowa heads this list

with 17 new members, Illinois is second with 14; Tennessee third with 13 and Kentucky fourth with 10 new members.

The number of new breeders to whom pure bred Aberdeen-Angus cattle were transferred for the first time was 1,742 compared with 1,404 in 1929. Seventy-eight breeders recorded 25 or more cattle during the year compared with 63 for 1929.

Farm Radio Programs

RADIO station W G Y announces the coming speakers as follows:

On January 5, on the Farm Forum programs, which are broadcast each Monday evening at 8:00 o'clock Eastern Standard Time, Dean A. R. Mann of the New York State College of Agriculture, will speak on "The New Year in Agriculture."

On January 12, Harry L. Lewis, Commissioner of the Rhode Island Department of Agriculture and a noted authority on poultry, will speak on "The Romance of the American Hen."

On January 19, Henry Morgenthau, Jr., publisher of American Agriculturist and chairman of Governor Roosevelt's Agricultural Advisory Commission, will speak on the subject of "1931 Recommendations of Governor Roosevelt's Agricultural Advisory Commission."

On January 26, Arthur M. Hyde is scheduled to speak, but at this writing the subject of his talk is not available.

About Cooperative Buying

PROFESSOR GEORGE WARREN of the New York State College of Agriculture suggests that if the government wishes to aid farmers it should encourage cooperative buying even more than cooperative selling. There is a great price difference between wholesale and retail prices, and farmers too often sell at wholesale and buy at retail. Most selling cooperatives take farm products to the wholesale markets, and, while they may reduce marketing costs, there is a distinct limit to the saving that can be made. If, through a cooperative, the farmers can buy at wholesale they will have an opportunity to effect important savings.

The Pennsylvania College Grange

THE Pennsylvania State College of Agriculture has a student Grange. The newly elected officers are as follows:

Lewis R. Good, Peach Bottom is the new master. Donald M. Goss, also of Peach Bottom, is overseer. Other officers are Glenn Z. Stevens, Shickshinny, lecturer; Henry H. Stover, Bedford, Steward; John C. Fertig, Dauphin, assistant steward; Miss Martha L. Boak, New

Castle, chaplain; Miss Margaret Garey, State College, Treasurer; Miss Charlotte L. Summers, Entrioken, secretary; James G. Eagelman Jr., Geigertown, gatekeeper; Miss Margaret E. Bernard, West Chester, Ceres; Miss Elizabeth J. Wallace, Edenburg, Pomona; Miss Helen E. Neff, Centre Hall, Flora; and Miss Rose D. Job, Ashland, lady assistant steward. Miss Boak will serve as pianist and Goss is a member of the executive committee, in addition to their other duties.

Progress of TB Eradication

THE latest report of the U. S. D. A. on the progress of bovine tuberculosis eradication gives the following figures:

New York State now has 12 modified accredited counties, 87,078 accredited herds containing 864,634 animals and, in addition, 25,664 herds containing 214,051 animals that have been tested once.

Pennsylvania has 36 modified accredited counties, 6,199 accredited herds containing 109,435 animals and, in addition, 122,022 herds containing 669,929 animals that have been tested once.

Larry Fay Trial Still On

THE trial of Larry Fay, along with several other individuals and corporations for alleged illegal acts in the loose milk trade, is proceeding rather slowly. The latest development is the illness of one juror, which threatens to hold up the trial. We might summarize the situation briefly by saying that milk dealers who are testifying against Fay have indicated that Fay's organization used threats to hold them in line and influence dealers to cut off their milk supply when they refused to meet the price demand of wholesale dealers. On the other hand, Fay maintains that everything was conducted in an entirely legal manner and that the purpose was merely to stabilize the industry.

We plan to keep you informed as to the outcome of the trial. It would seem that stabilization of the loose milk industry would be an excellent thing because it is no secret that price cutting has seriously demoralized the market. At the same time, we doubt if any attempt to do this, based on violence or intimidation, is likely to succeed, or should succeed.

What Potato Consumers Want

THE Bureau of Agricultural Economics of the U. S. Department of Agriculture, has been collecting information as to the preference of consumers of potatoes. The general conclusions are that most housewives in Eastern States, prefer potatoes ranging from 2½ to 3 inches in diameter. Dealers who supply hotels

and restaurants want them from 2¾ to 3½ inches in diameter. Very large sizes are not wanted by any trade.

Dealers in various sections of the country indicated their preference as to origin. The largest number prefers Maine potatoes; with Pennsylvania, Prince Edward Islands, and Long Islands running them a close second. It developed that few housewives ask for potatoes by variety, but that a considerable number ask for them by location; that is, they ask for Long Island potatoes, Maine potatoes, or Prince Edward Island potatoes.

Wheat Goes Lower

THE recent request of the Federal Farm Board for an additional appropriation of \$150,000,000 of the \$500,000,000 originally authorized by the Federal Marketing Act, has received favorable action by the House. This makes a total of \$400,000,000 which has been appropriated up to date. There is every indication that the administration will be authorized to use \$45,000,000 in loans to insure crops next year in drought stricken areas and from \$110,000,000 to \$166,000,000 to be used in emergency construction to stimulate employment.

Wheat prices are lower again. December wheat at Chicago on December 22, closed at 76½c. Quotations at Winnipeg for December went as low as 50½c, which is believed to be the lowest figure known since the Prairie Provinces became a factor in the wheat situation. Mr. George Milnor, president of the Wheat Stabilization Corporation, states that domestic conditions do not justify lower wheat prices and that there will be no change in the policy of the Stabilization Corporation in supporting the American wheat market at the prevailing price level regardless of developments in the foreign situation.

Massachusetts Holstein Makes Good Record

HOW a good Holstein cow of good breeding and with good farm care but without forcing will produce profitably year after year is forcibly illustrated by Highfield Colantha Mooie, owned by John G. Ellis of Lee, Mass. In 8 years, one month and 26 days, she has produced nine calves of which four are females and five are males and has produced 156,714 pounds (73,000 quarts) of milk containing 5,287.76 pounds of butterfat. She has calved regularly every 12 months in all but one of her lactations and qualified seven of her eight lactations in the 10 months division, yet she has won two national championships in the 10-month division and has placed high up in three other lactations showing that a cow can be kept on test year after year without forcing and without injuring her ability to produce or to reproduce.

In her latest record, Colantha is credited with 21,498.5 pounds (10,000 quarts) of milk containing 735.7 pounds of butterfat, on 10-month test and three daily milkings. According to her owner, she consumed 14,324 pounds of roughage, 7,564 pounds of concentrates and was three months on pasture. The total cost of the feed, including pasture, was \$312.85. Her 10,000 quarts of milk sold for \$754.29 which leaves a profit above feed of \$441.44 or approximately 4.4 cents a quart. If the total lifetime production of 73,000 quarts returned the same profit above feed, then she would return \$3,212 above feed cost in her eight years and two months productive life. As she is a medium sized Holstein weighing between 1300 and 1400 pounds, her beef value would bring the total return above feed to exceed \$3,300.

World's Record Ayrshire Heifer Developed

THE Ohio State University owns Penshurst Charming Kalley, a junior three-year-old Ayrshire heifer who just produced 14,449 pounds of milk and 582.62 pounds of butterfat in 305 days. This new champion was bred by Penshurst Farm, Narberth, Pennsylvania.

Hannibal Boy Enters News Writing Contest

EDITOR'S NOTE:—A few weeks ago we offered a monthly prize for the best news story sent us by a high school student in vocational agriculture. Up to date the best story received is the following one by Harold Palen of the Hannibal High School. Unless some student sends in a better story which is printed during January, Harold will get the prize. At any rate, he will be paid space rates for the following item:

THE boys of the agriculture class of Hannibal High School visited Mr. Lonis's farm Friday December 12, and I am sure we all had a fine time and learned many things.

When we reached the farm Professor Cope, who was to give a lecture on reforestation, had not yet arrived. The class went to the barn and looked over a fine herd of guerneys. Mr. Lonis took us to see his poultry, a fine flock of White Leghorns. By that time Mr. Cope arrived and we went to the forest. He began the lecture on trees by showing their growth in twenty-two years. He showed us how to clear a plot of ground of the weed trees.

In his talk Mr. Cope told us the harm

of pasturing a forest. The tree which did a great amount of harm in the plot was beech because it took up so much room and shaded smaller trees. He showed us how to tell the different kinds of trees which we did not know. Mr. Cope explained to the class that iron wood should be taken from the forest plot as soon as possible. He said a standard cord of iron wood contained as much heat as a ton of anthracite coal. On the last end he had a contest in which we all took part. He put tags on fifty trees and we were to put on a card which ones were to come out and which were to be left. Richard Geer had the highest mark of 92%. Victor Dennison second; Mr. Lockwood, several others and myself were third. Mr. Cope explained and pointed out to us our mistakes.

Mr. Lonis gave us the figures of hours, men, horses, machinery, and other things which took to clear out the plot properly. He had a part of the wood and a profit of about \$10 left. After this we came home rather wet and cold but well satisfied with what we had heard and seen.—HAROLD PALEN.

Here's the way to get Modern Home Equipment

If you can make your chickens lay better, they'll pay better, and bring you extra money to buy house furnishings and other things you want.

Poultry raisers often find that their flocks lay two or three times as many eggs when Pearl Grit is fed. And the eggs are larger. They have firmer, smoother shells. Such eggs are in greatest demand and bring highest prices.

See for yourself how Pearl Grit acts. Now—in winter—hens need it most. Get it from your dealer. Costs very little. Comes in 10-lb. boxes and 100-lb. bags.

Our valuable book about Poultry Profits can easily be worth hundreds of dollars to you. We will gladly send it free. Mail letter or postal for it today.

New Way to Buy Oil

Order Direct Buy At Rock Bottom Prices

Save Money. Get the Best

A new plan for buying auto, truck and tractor oils—house and barn paints—is sweeping the country! Thousands of farmers everywhere are now saving big money by ordering direct from the nationally known Central Petroleum Co. on long credit terms. Our nearby warehouse delivers. Thus finest quality oils, paints, and roofing—famous Cen-Pe-Co lines—can be bought at amazing low prices! Cen-Pe-Co 100% pure paraffin base Motor Oils have been a leader in the field of motor lubrication for nearly two decades. Cen-Pe-Co paints and roofing challenge comparison for service and economy. Over 50,000 farmer-customers are satisfied users.

LOCAL DISTRIBUTORS WANTED No investment or experience needed. Make \$50 to \$100 a Week

Thousands waiting to buy on this new, money-saving plan. Simply take orders and call on users for repeat business. Work all or part time. Everything necessary to start right out, furnished free. We show you how. Pay you every week. Wengard, Ohio, made \$430.00 for his share in one week. Montgomery, in Iowa, made \$216.00 for the first week he started. You too can make big money. Write quick for this opportunity. Send name and address today, and full particulars will come by return mail. First applications get the preference. Act NOW!

With the A. A. Poultry Farmer

Little Things That Count Big

By L. E. WEAVER
A. A. Poultry Editor

PERHAPS a better title would have been "the importance of the infinitesimal." That is the phrase the professor used in the animal husbandry class when he was discussing this matter of iodine in the diet of humans as well

L. E. Weaver

as of animals. It is an excellent phrase but I was afraid that big word in the heading would discourage everyone from reading any further. And this is of enough importance that every farmer should read it, even though he may not have a hen on the place.

The big difference between iodine in very small traces in the diet and no iodine at all has been given a great deal of publicity, and is fairly well known. Along the Great Lakes and into the Northwest runs a strip of territory where iodine is entirely absent from the soil. Plants grown there, the hay, vegetables, potatoes, and so on, cannot, of course, carry even the "infinitesimal" amount needed to keep the body in tone. So in that region goitre is common in humans. Or perhaps it is better to say it was common until people knew that traces of iodine in their food would prevent goitre, and the use of iodized salt became common. In this same region pigs are apt to be born weak and hairless unless iodine is in the ration of the mother.

Animals Need Copper

A similar fact more recently discovered is that infinitesimal traces of copper are necessary, probably just as much so as is iodine. So very little is needed that until recently it was not known that we were getting any at all. But copper in the merest trace occurs as an impurity in iron. We have always known that we need our iron. But we didn't know that the copper was a very necessary addition to the iron.

Here again it is with pigs that the discovery was made. Nursing pigs sometimes have a disorder called "thumps." They go into a mild sort of spasm in which their muscles twitch and cause the thumping which gives the disease its name. The direct cause of this trouble is a lack of oxygen in the muscles. Ordinarily, the blood supplies plenty of oxygen to the muscles by loading up the carriers, the red corpuscles in the lungs and running them out and bringing back the waste carbon dioxide on the return trip. That is the blood's main job. But in the "thumps" the carriers are not built right. Perhaps they have stake-bodies where they should have dump-bodies.

At any rate, an important part of their make-up is "hemoglobin" and it takes the trace of copper in the iron to make the hemoglobin. So now the farmers of the middle west are being taught to mix some ferric sulfate with corn syrup and swab it along the mother sow's udder. Thus the nursing pigs get the trace of iron and of copper and the trouble is stopped.

Now from these two examples one could go on and point out a number of ways that farmers may gain or lose out through very little things. But there is only one point that I have been leading up to; that good early hatches next spring depend on how you are handling your hens now. There are a few little things that are easily overlooked and not considered that may count big in the hatch.

I have no quarrel with the person who buys chicks, provided they are real chicks and not cheap junk. But for such the rest of this discussion will not be of direct interest. Also those people who are in the habit of setting their hens or incubators in May or June need not worry particularly about Vitamin D at least, for the spring sunshine will have taken care of that. However, they may well consider getting the chicks out earlier in the season. It is usually more profitable.

Feed Vitamins Now

To the man who is planning to sell chicks, or to the ones who want their own eggs hatched early, it is important to know that all eggs are not alike inside. They may look alike and taste alike, but one may hatch and the other fail. And whether the eggs hatch well or poorly may decide whether the boss gets a new car this season or gets along another year with the old one. It is true that poor hatches may be due to poor incubation. That is one of the big things that will be thought of anyway. And here we are concerned with seeing to it that only good hatchable eggs go into the machine, or under the hen. The difference between the eggs that hatch and the ones that fail is due, to a great extent, to such little things as we were discussing at the start. Probably Vitamins A, B, and D, as well as some of the minerals, are all concerned. But we need not go into the details. It is sufficient to know that milk and cod liver oil along with the usual grain and dry mash mixtures will probably supply the hen with all the essential little things. But to be even more sure one will do well to supply well-cured clover or alfalfa hay, alfalfa leaf meal, sprouted oats, lettuce or cabbage. Only remember that it is easy to feed too much. The hens prefer the greens to the mash. But it is the mash that makes the eggs.

And one more important thing be-
(Continued on Opposite Page)

This shows most of the new egg laying contest plant at the State School of Applied Agriculture at Farmingdale, Long Island. This new plant is modern in every respect. Each pen is insulated and ventilated and contains running water and electric lights.

The center section contains, on the ground floor, a feed room and a room where records are kept. Upstairs in the middle section are sleeping quarters for those who manage the contest. Anyone who is familiar with the former plant will agree that this is a wonderful improvement. Before this was built, each pen was housed in a small individual house with very little in the way of equipment.

sides feeding milk and cod liver oil all winter to the breeders is to give them time to get their new feathers all grown in and to gain back the normal weight and a moderate amount of fat. A hen can't make good vigorous eggs when she is herself physically under par.

Heat for the Laying House

THE use of heat in the laying house may still be in the experimental stage, but many commercial poultrymen are supplying it by various means, feeling it to be profitable in their particular cases, at least. Birds would undoubtedly be benefited in many ways if the temperature were never allowed to drop below freezing, but it is not known whether increased production would be a direct result. Less feed would be necessary to maintain body temperature, leaving a greater proportion to be devoted to egg production. Protection from sudden changes in temperature which often cause a slump in laying, maintaining a drier house, and preventing the drinking water from freezing are other advantages to be considered. Heat may be supplied by means of brooder stoves, taking care, of course, to reduce the fire hazard as far as possible, or by hot water systems either below or above the floor. A temperature of 35 to 40 degrees Fahrenheit is usually considered sufficient. Ventilation must be carefully checked with the use of heat, for a constant supply of pure air must enter the house, and a sufficient circulation be maintained to carry out the foul air and keep the temperature as nearly uniform as possible in all parts of the house.

If corn is worth \$1 wheat is worth \$1.07 if fed to poultry or sheep and \$1.12 if fed to hogs and cattle.

KERR BABY CHICKS ARE BRED TO LAY

THE 3000 birds on our breeding farm are descended from hens with large official records in the egg-laying contests. Part of them are also trap-nested under the rules of the New Jersey Record of Performance. The egg-laying qualities of Kerr chicks from this ancestry are firmly fixed.

In 1929-30 competitions, Kerr White Leghorns made records up to 304 eggs in 365 days. Kerr Barred Rocks, 257 eggs in 51 weeks. Kerr R. I. Reds made records up to 273 eggs in 51 weeks.

The baby chicks you buy from Kerr Chickeries carry the same blood lines as do these contest winners. BRED to lay—available from stock tested for B. W. D., which is the best insurance for livability.

Write for the Kerr Chick Book and prices.

Stubborn Coughs Ended by Recipe, Mixed at Home

Here is the famous old recipe which millions of housewives have found to be the most dependable means of breaking up a stubborn, lingering cough. It takes but a moment to prepare and costs little, but it gives real relief even for those dreaded coughs that follow severe cold epidemics.

From any druggist, get 2½ ounces of Pinex, pour it into a pint bottle and fill the bottle with plain granulated sugar syrup or strained honey. Thus you make a full pint of better remedy than you could buy ready-made for three times the cost. It never spoils and tastes so good that even children like it.

Not only does this simple mixture soothe and heal the inflamed throat membranes with surprising ease, but also it is absorbed into the blood, and acts directly upon the bronchial tubes, thus aiding the whole system in throwing off the cough. It loosens the germ-laden phlegm and eases chest soreness in a way that is really astonishing.

Pinex is a highly concentrated compound of genuine Norway Pine, containing the active agent of creosote, in a refined, palatable form. Nothing known in medicine is more helpful in cases of distressing coughs, chest colds, and bronchial troubles.

Do not accept a substitute for Pinex. It is guaranteed to give prompt relief or money refunded.

Good and Good for You.

The Quilting Club

How One Group Combines Work and Pleasure

TWELVE congenial neighbor ladies comprise the Quilting Club which meets once in two weeks during nine months of the year, omitting the busy summer period. Each member pieces a quilt and then the members draw to see who will have the first one quilted. The hostess selects her own pattern for the quilting whether simple or elaborate, and has the quilt in the frame when the members arrive at the community hall which is better than a home for the work.

Following the old-time custom, the families come in for supper which is a picnic affair. Often guests are invited, in which case two quilts are finished in an afternoon. Children come in from

this shorter attire made the work of the nurses much easier.

The little slips I had made of fine material, edged with narrow lace, and made with tiny sleeves, were set aside, and baby's first gowns were like capes, tied with tapes in the back. Thus the small hands were covered, and there was no putting little arms in and out of sleeves.—A.B.S.

Raisin Pie

WASH one cup of seeded raisins and put into a sauce pan with one cup of cold water, bring slowly to a boil, add one tablespoon of sugar, one tablespoon of corn starch and one half teaspoon of salt. Mix together with a little cold water, boil all together three minutes, then pour into a pie tin, which has been lined with a crust, cover with top crust and bake in oven with quick bottom heat. This is my favorite recipe for raisin pie.—MISS E. D.

Russian Influence

Dress pattern No. 2855 shows the Russian influence on dress styles this season in its Cossack cuffs and peplum. The scalloped finish on the raver and cuffs is especially attractive. Crepe woolen, transparent velvet, supple tweed or canton crepe would be suitable to use in this design. The pattern cuts in sizes 14, 16, 18, 20 years, 36, 38, and 40 inches bust measure. Size 16 requires 3¾ yards of 39-inch material with 1 yard of 35-inch contrasting and 2¾ yards of binding. Price, 15 cents.

school for their share of the social and the quilting is over at an early hour. In this way each member gets a new quilt at very small cost each season, and the social life of the community an enjoyable asset.—HILDA RICHMOND.

Four Out of One

LITTLE blankets, of course, are greatly needed for the small stranger who comes via Stork, and little blankets are not inexpensive. I was interested to note that in the hospital full-sized blankets had been cut into quarters and neatly blanket-stitched around the edges, making four little blankets at a comparatively small cost.

I learned too, that some patients simply wore pajama coats, instead of gowns. While to all appearances they were "correctly dressed" for callers,

Keep Summer Clothes Fresh

TO keep summer clothes fresh in winter storage some simple rules should be followed: all clothing should be put away clean in a clean protected place; put cotton clothes away without starching; clean all woolen garments and pack in moth-proof containers; silk keeps best if rolled in tissue paper instead of being folded; shoes should be cleaned, held in shape with soft paper or shoe trees and stored where they will not harden.

Schoolgirl Model

Dress pattern No. 2884 is sweet and simple for the schoolgirl and can be most comfortable for cold weather if made up in covert cloth, wool crepe, tweed-like cottons, tweed mixtures and patterned wool crepe. The pattern cuts in sizes 8, 10, 12 and 14 years. Size 8 requires 1¾ yards of 39-inch material and ¾ yard of 35-inch contrasting. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps (do not send coins). Add 12c in stamps for one of the winter Catalogs and address to Pattern Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y.

Aunt Janet's Corner

The New Year Brings Accounting Time

IT may be old-fashioned to make New Year resolutions but the idea behind the deed is as good as ever. At the New Jersey Master Farmer banquet a speaker remarked that one of the Master Farmers had discovered that good farming was done as much by the use of a lead pencil as by plow and harrow. He had found it absolutely necessary to keep accounts and occasionally, (monthly, weekly or at longer intervals) find where he stands.

Home-making is not so easy to set off, as having a beginning and a stopping place, as crops are, and New Years is as good a time as any to look the job in the eye and see what's what. This is one time to examine ourselves closely and marshal the unvarnished

yourself, not too many nor too big for possible accomplishment within the time allowed. Then, at the end of the year, it gives such a feeling of satisfaction to look back and see that definite plans had been carried out and can be checked off the list. Of course, any of the plans would be only a part of that big thing we call Life and should contribute to making it richer and fuller of happiness.—AUNT JANET.

How to Make Good Vinegar

CIDER should be made from clean and sound ripe apples to prevent contamination of the fermenting juice with molds that will cause the wrong kind of fermentation and injure the quality of the vinegar.

For best results cider must be stored in thoroughly cleaned barrels that have been scalded with steam or boiling water.

Temperature is an important factor to be controlled. The fermenting cider should be stored where the temperature is maintained at about 70 degrees Fahrenheit. During the alcoholic fermentation which occurs first the opening in the barrel should be covered with cheese cloth to allow carbonic acid gas to escape and to exclude excess air, dirt, and insects.

After the alcoholic fermentation is finished the cider undergoes a second change whereby alcohol is converted into acetic acid which is the sour or acid element of vinegar. The first change should be completed before the acetic fermentation is encouraged. Air is not required for the alcoholic fermentation but is absolutely essential for growth of vinegar producing bacteria.

During the acetic fermentation the barrels should be about three-fourths full. The bung hole must be open and the barrel left undisturbed. The vinegar producing bacteria, with favorable conditions of temperature and air supply, multiply rapidly and soon form a film on the surface of the liquid. This film commonly called "mother" must not be disturbed. If it sinks to the bottom the bacteria will start a fermentation that spoils the quality of the vinegar. With proper conditions of temperature and air supply the vinegar making process can be completed in from eight to ten months.

An Oilcloth Froggy

THIS is Mr. Frog! He is a cunning, chubby sort of creature, not at all reptilian, but just a wise-eyed froggy pillow to set on the floor, a shelf or a chair arm as a sort of mascot. He comes stamped on jade green and light yellow oilcloth materials with yellow, black and white floss included to fix him up according to directions, as No. M244 at 50 cents complete. The body is about 10 inches square with short arms and long jointed legs in proportion. These oilcloth toys or pillows are easily made, being mostly a process of blanket-stitching edges together. We also have a turtle 20 inches long, nose to tail, and he may be ordered as No. M664X at 50 cents complete with thread.

M244 Oilcloth and Thread Complete to Make Frog Pillow 50c. Order from Embroidery Dept., American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR
That's why

FOR WASHDAY AND EVERY DAY FELS-NAPTHA IS A BARGAIN!

FELS-NAPTHA is the soap that brings you *extra* help! That's what you want when you wash and clean. That's the real soap bargain for you! That's Fels-Naptha!

Fels-Naptha gives you *extra* help because it brings you two active cleaners! Not "just soap," but good soap and plenty of grease-dissolving naptha combined in a big golden bar. Hand-in-hand, this lively pair dissolves grease. Even stubborn dirt lets go, and your wash is beautifully done—bright, sweet, thoroughly clean—without hard rubbing!

Fels-Naptha works so quickly, that it saves your hands, too. (And Fels-Naptha contains bland, soothing glycerine!) Just try it! Use tub or machine. Use hot, lukewarm or cool water. Soak or

boil. And don't forget—for brightening woodwork and windows, for washing separators, too—Fels-Naptha gives *extra* help! Get a few bars, or the handy ten-bar carton, at your grocer's today.

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Dept. 1-1-13, Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR

FELS-NAPTHA

TOO MUCH ACID may be causing those frequent headaches

WHEN there's too much acid in your stomach, you must force yourself to work, and even pleasures are too great an effort. Appetite lags; the digestion is poor; the whole system suffers.

Laboratory tests show that an acid condition is due to errors in modern diet. But you need not wait to diet your way out of trouble!

Take a tablespoonful of Phillips' Milk of Magnesia.

This will neutralize the excess acid instantly; make you feel like a new person in just a few moments.

Take a little whenever heartburn, sick headaches, nausea, flatulence, indigestion or biliousness show the digestive system is becoming too acid.

Whenever you are taking cold or feel sluggish, weak, constipated. Phillips' Milk of Magnesia has a gentle laxative action.

Delightful to take. Endorsed by physicians for 50 years and prescribed everywhere for men, women and children. The genuine is always a liquid; it cannot be made in tablet form. It always bears the name Phillips' for your protection.

PHILLIPS' MILK OF MAGNESIA

When writing advertisers be sure to say that you saw it in
AMERICAN AGRICULTURIST

Pansy Picture No. B3761 comes stamped on hand-tinted canvas with floss for working the design. The package also contains picture frame, glass and mat. It finishes about 5 3/4 by 7 3/4 inches. Price \$1.00. Order from Embroidery Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, New York.

facts of the case without offering excuses or alibis. This is the only way we can hope to progress. Anybody who does a poor job can always find plenty of reasons why he did not succeed.

Too much self-abasement is as bad as too much self-pity, but an occasional searching self-examination is a good, healthy thing. We have to be the sternest judges of our own accomplishments and set our own standards for success.

Just what did we start out to accomplish last year? How far short of the aim did we come? Why did we not realize all the aims we intended? What definite things shall we plan for 1931?

In all organizations a program of work is drawn up, and at least the heads of the organization use it as a guide for the year's activities. Naturally, a part of the program carries over from year to year, but each year should see some special, definite thing to accomplish which can be regarded as complete within itself. In a smaller way, this plan is not so bad for a family.

Every woman's resolutions will be different from every other woman's, and that is right, for no two families have exactly the same problems. But how are these suggestions for possible achievements this year?

1. I will plan and plant enough of a garden to supply my family with vegetables (canned or stored) other than potatoes, for the whole year.

2. I will make my place a more beautiful one to live in (a) by planting shrubs, flowers or trees; (b) by freshening up the house and rearranging or doing over furniture, one room at least; (c) by giving more time to the little joys of family life such as reading together, games, picnics, a trip to the park, or to the museum, or some other special treat.

3. I shall have a "no-colds" campaign and honor in a special way each member of the family who gets through the winter without one.

4. I shall get that hooked or braided rug made that I have talked about all year.

5. I will examine my routine of work to see if I am wasting motion or time, and, if so, what I can do to save both. This will give opportunity for more personal and family development.

These are mere thoughts; no doubt you can think up several pet plans for

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is considered a real problem by Mr. Holly. The boy hears him say that no one wants him and goes to the barn loft where he can feel that his father is near him. He is missed by Mrs. Holly who cannot resist telling him that she does want him. David is happy again, but Mr. Holly feels that it is just another mouth to feed with the mortgage coming due at the bank soon.

David's latest escapade is the release of a crow that Perry Larson had captured by endless patience and staked out in the cornfield to keep other crows away.

David is lonely but a new friend cures this trouble. Blind Joe Glaspell, who plays the violin, arouses David's sympathy and he loans Joe his father's violin. The Gaspsells frequently lack enough to eat and Mrs. Holly is surprised to find that David has been taking stuff from her pantry without any thought that she would object. Mrs. Holly still allows him to take food, but only after asking her.

But not always toward the Glaspell shanty did David turn his steps. Very frequently it was in quite another direction. He had been at the Holly farmhouse three weeks when he found his Lady of the Roses.

He had passed quite through the village that day, and had come to a road that was new to him. It was a beautiful road, smooth, white, and firm. Two huge granite posts topped with flaming nasturtiums marked the point where it turned off from the main highway. Beyond these, as David soon found, it ran between wide-spreading lawns and flowering shrubs, leading up the gentle slope of a hill. Where it led to, David did not know, but he proceeded unhesitatingly to try to find out. For some time he climbed the slope in silence, his violin, mute, under his arm; but the white road still lay in tantalizing mystery before him when a by-path offered the greater temptation, and lured him to explore its cool shadowy depths instead.

Had David but known it, he was at Sunnycrest, Hinsdale's one "show place," the country home of its one really rich resident, Miss Barbara Holbrook. Had he also but known it, Miss Holbrook was not celebrated for her graciousness to any visitors, certainly not to those who ventured to approach her otherwise than by a conventional ring at her front doorbell. But David did not know all this; and he therefore very happily followed the shady path until he came to the Wonder at the end of it.

The Wonder, in Hinsdale parlance, was only Miss Holbrook's garden, but in David's eyes it was fairyland come true. For one whole minute he could only stand like a very ordinary little boy and stare. At the end of the minute he became himself once more; and being himself, he expressed his delight at once in the only way he knew how to do—by raising his violin and beginning to play.

He had meant to tell of the limpid pool and of the arch of the bridge it reflected; of the terraced lawns and marble steps, and of the gleaming white of the sculptured nymphs and fauns; of the splashes of glorious crimson, yellow, bluish-pink, and snowy white against the green, where the roses rioted in luxurious bloom. He had meant, also, to tell of the Queen Rose of them all—the beautiful lady with hair like the gold of sunrise, and a gown like the shimmer of the moon on water—of all this he had meant to

tell; but he had scarcely begun to tell it at all when the Beautiful Lady of the Roses sprang to her feet and became so very much like an angry young woman who is seriously displeased that David could only lower his violin in dismay.

"Why, boy, what does this mean?" she demanded.

David sighed a little impatiently as he came forward into the sunlight.

"But I was just telling you," he remonstrated, "and you would not let me finish."

"Telling me!"

"Yes, with my violin. *Couldn't* you understand?" appealed the boy wistfully. "You looked as if you could!"

"Looked as if I could!"

"Yes. Joe understood, you see, and I was surprised when he did. But I was just sure you could—with all this to look at."

The lady frowned. Half-unconsciously she glanced about her as if contemplating flight. Then she turned back to the boy.

"But how came you here? Who are you?" she cried.

"I'm David. I walked here through the little path back there. I didn't know where it went to, but I'm so glad now I found out!"

"Oh, are you!" murmured the lady with slightly uplifted brows.

She was about to tell him very coldly that now that he had found his way there he might occupy himself in finding it home again, when the boy interposed rapturously, his eyes sweeping the scene before him:—

"Yes. I didn't suppose, anywhere, down here, there was a place one half so beautiful!"

An odd feeling of uncanniness sent a swift exclamation to the lady's lips.

"Down here! What do you mean by that? You speak as if you came from—above," she almost laughed.

"I did," returned David simply. "But even up there I never found anything quite like this,"—with a sweep of his hands,—"*nor like you, O Lady of the Roses,*" he finished with an admiration that was as open as it was ardent.

This time the lady laughed outright. She even blushed a little.

"Very prettily put, Sir Flatterer," she retorted; "but when you are older, young man, you won't make your compliments quite so broad. I am no Lady of the Roses. I am Miss Holbrook; and—and I am not in the habit of receiving gentlemen callers who are uninvited and—unannounced," she concluded, a little sharply.

Pointless the shaft fell at David's feet. He had turned again to the beauties about him, and at that moment he spied the sundial—something he had never seen before.

"What is it?" he cried eagerly, hurrying forward. "It isn't exactly pretty, and yet it looks as if 't were meant for—something."

"It is. It is a sundial. It marks the time by the sun."

Even as she spoke, Miss Holbrook wondered why she answered the question at all; why she did not send this small piece of nonchalant impertinence about his business, as he so richly deserved. The next instant she found herself staring at the boy in amazement. With unmistakable ease, and with the trained accent of the scholar, he was reading aloud the Latin inscription on the dial: "*Horas non numero nisi serenas*," "I count—no—hours but—unclouded ones," he translated then, slowly, though with confidence. "That's pretty; but what does it mean—about 'counting'?"

Miss Holbrook rose to her feet.

"For Heaven's sake, boy, who, and what are you?" she demanded. "Can you read Latin?"

"Why, of course! Can't you?"

With a disdainful gesture Miss Holbrook swept this aside.

"Boy, who are you?" she demanded again imperatively.

"I'm David. I told you."

"But David who? Where do you live?"

The boy's face clouded.

"I'm David—just David. I live at Farmer Holly's now; but I did live on the mountain with—father, you know."

A great light of understanding broke over Miss Holbrook's face. She dropped back into her seat.

"Oh, I remember," she murmured.

"You're the little—er—boy whom he took. I have heard the story. So *that* is who you are," she added, the old look of aversion coming back to her eyes. She had almost said "the little tramp boy"—but she had stopped in time.

"Yes. And now what do they mean, please,—those words,—'I count no hours but unclouded ones'?"

Miss Holbrook stirred in her seat and frowned.

"Why, it means what it says, of course, boy. A sundial counts its hours by the shadow the sun throws, and when there is no sun there is no shadow; hence it's only the sunny hours that are counted by the dial," she explained a little fretfully.

David's face radiated delight.

"Oh, but I like that!" he exclaimed.

"You like it!"

"Yes. I should like to be one myself, you know."

"Well, really! And how, pray?" In spite of herself a faint gleam of interest came into Miss Holbrook's eyes.

David laughed and dropped himself easily to the ground at her feet. He was holding his violin on his knees now.

"Why, it would be such fun," he chuckled, "to just forget all about the hours when the sun didn't shine, and remember only the nice, pleasant ones. Now for me, there wouldn't be any hours, really, until after four o'clock, except little specks of minutes that I'd get in between when I *did* see something interesting."

Miss Holbrook stared frankly.

"What an extraordinary boy you are, to be sure," she murmured. "And what, may I ask, is it that you do every day until four o'clock, that you wish to forget?"

David sighed.

"Well, there are lots of things. I hoed potatoes and corn, first, but they're too big now, mostly; and I pulled up weeds, too, till they were gone. I've been picking up stones, lately and clearing up the yard. Then, of course, there's always the woodbox to fill, and the eggs to hunt, besides the chickens to feed,—though I don't mind *them* so much; but I do the other things, 'specially the weeds. They were so much prettier than the things I had to let grow, 'most always."

Miss Holbrook laughed.

"Well, they were; and, really," persisted the boy, in answer to the merriment in her eyes; "now wouldn't it be nice to be like the sundial, and forget everything the sun didn't shine on? Wouldn't you like it? Isn't there anything *you* want to forget?"

Miss Holbrook sobered instantly. The change in her face was so very marked, indeed, that involuntarily David looked about for something that might have cast upon it so great a shadow. For a long minute she did not speak; then very slowly, very bitterly, she said aloud—yet as if to herself:—

"Yes. If I had my way I'd forget them every one—these hours; every single one!"

"Oh, Lady of the Roses!" expostulated David in a voice quivering with shocked dismay. "You don't mean—you can't mean that you don't have any—sun!"

"I mean just that," bowed Miss Holbrook wearily, her eyes on the somber shadows of the pool; "just that!"

David sat stunned, confounded. Across the marble steps and the terraces the shadows lengthened, and David watched them as the sun dipped behind the tree-tops. They seemed to make more vivid the chill and the gloom of the lady's words—more real the day that had no sun. After a time the boy picked up his violin and began to play, softly, and at first with evident hesitation. Even when his touch became more confident, there was still in the music a questioning appeal that seemed to find no answer—an appeal that even the player himself could not have explained.

For long minutes the young woman and the boy sat thus in the twilight. Then suddenly the woman got to her feet.

"Come, come, boy, what can I be thinking of?" she cried sharply. "I must go in and you must go home. Good-night." And she swept across the grass to the path that led toward the house.

CHAPTER XI

JACK AND JILL

DAVID was tempted to go for a second visit to his Lady of the Roses, but something he could not define held him back. The lady was in his mind almost constantly, however; and very vivid to him was the picture of the garden, though always it was as he had seen it last with the hush and shadow of twilight, and with the lady's face gloomily turned toward the sunless pool. David could not forget that for her there were no hours to count; she had said it herself. He could not understand how this could be so; and the thought filled him with vague unrest and pain.

Perhaps it was this restlessness that drove David to explore even more persistently the village itself, sending him into new streets in search of something strange and interesting. One day the sound of shouts and laughter drew him to an open lot back of the church where some boys were at play.

David still knew very little of boys. In his mountain home he had never had them for playmates, and he had not seen much of them when he went with his father to the mountain village for supplies. There had been, it is true, the boy who frequently brought milk and eggs to the cabin; but he had been very quiet and shy, appearing always afraid and anxious to get away, as if he had been told not to stay. More recently, since David had been at the Holly farmhouse, his experience with boys had been even less satisfying. The boys—with the exception of blind Joe—had very clearly let it be understood that they had little use for a youth who could find nothing better to do than to tramp through the woods and the streets with a fiddle under his arm.

To-day, however, there came a change. Perhaps they were more used to him; or perhaps they had decided suddenly that it might be good fun to satisfy their curiosity, anyway, regardless of consequences. Whatever it was, the lads hailed his appearance with wild shouts of glee.

"Golly, boys, look! Here's the fiddlin' kid," yelled one; and the others joined in the "Hurrah!" he gave.

David smiled delightedly; once more he had found some one who wanted him—and it was no nice to be wanted! Truth to tell, David had felt not a little hurt at the persistent avoidance of all those boys and girls of his own age.

"How—how do you do?" he said diffidently, but still with that beaming smile.

Again the boys shouted gleefully as

(Continued from Opposite Page)

they hurried forward. Several had short sticks in their hands. One had an old tomato can with a string tied to it. The tallest boy had something that he was trying to hold beneath his coat.

"H—how do you do?" they mimicked. "How do you do, fiddlin' kid?"

"I'm David; my name is David." The reminder was graciously given, with a smile.

"David! David! His name is David," chanted the boys, as if they were a comic-opera chorus.

David laughed outright.

"Oh, sing it again, sing it again!" he crowed. "That sounded fine!"

The boys stared, then sniffed disdainfully, and cast derisive glances into each other's eyes—it appeared that this little sissy tramp boy did not even know enough to discover when he was being laughed at!

"David! David! His name is David," they jeered into his face again. "Come on, tune her up! We want ter dance."

"Play? Of course I'll play," cried David joyously, raising his violin and testing a string for its tone.

"Here, hold on," yelled the tallest boy. "The Queen o' the Ballet ain't ready." And he cautiously pulled from beneath his coat a struggling kitten with a perforated bag tied over its head.

HANDY ANDY Says "Here's How"

To Detect Fruit Tree Cankers

By Ray Inman

FRUIT TREE CANKERS ARE BEST DETECTED IN DORMANT PERIOD WHEN TREES ARE WITHOUT LEAVES

CANKERS ARE ACTIVE SOURCES OF DISEASE AND SHOULD BE REMOVED PROMPTLY LEST THE INFECTION SPREAD.

REMOVE ALL DEAD WOOD WITH KNIFE, ADZ, OR AXE AND BURN IT. APPLY PROTECTIVE SPRAY OR DUST TO WOUND.

1930 ---A Bad Year for Prophets

(Continued from Page 3)

once more we must rely quite largely on the conclusions of the forecasters of business activity.

They are not in entire agreement, but the view that business is now near bottom, that the period of low activity will last for a few months longer, that an upward trend will become evident by spring, that it will be quite gradual at first and that it will be a year or more after the upturn starts before business will reach normal, appears to be well fortified.

Things Are Looking Up

That belief is based partly on the history of previous severe depressions, and partly on the correction already seen in some of the unfavorable conditions. Interest rates for short term loans have dropped to levels which have seldom been seen in our history. Long term money rates are moderately low. Lenders are extremely cautious as to security, however, owing to recent losses. Progress is being made toward moving inventories. Goods in consumers' hands are wearing out faster than they are being replaced, building up potential demand. Underbuilding in the past year has offset part of the previous overbuilding. Wages are being reduced, encouraging attempts to find ways to utilize the cheaper labor available.

If this view as to the way conditions outside of agriculture will develop is correct, then 1931 should be characterized by some improvement in demand, at least by the time the new crops begin to come to market. In the early part of 1931, it probably will be below the same period in 1930. The fact that it may be improving in the last half of the year is decidedly encouraging, as it suggests a still higher level of demand into 1932.

What Will Production Be?

So much for the demand. On the production side, a repetition of the

severe drought is improbable. That factor must be rated as favorable by those who suffered from it in 1930.

The chances seem to favor some increase in total volume of crop production. Lacking profitable alternatives either on the farm or in town, farmers will tend to maintain acreage, although they will try to reduce expenses. Yields per acre probably will be larger than in 1930 when average production per acre was 8.9 per cent below the average of the last ten years.

This made 1930 per capita production of principal crops 7.4 per cent below the rather low production of 1929 and 13.2 per cent below the average of the preceding ten years.

Total production of meat animals probably will be a little less than in 1930. Moderate decreases may be seen in dairy and poultry production although the symptoms are in doubt, especially as to dairy output.

On the favorable side for 1931, then, are better demand in the second half of the year, the probability of no severe climatic handicap such as the drought of 1930, and prospects of lower costs for hired labor and lower retail prices for materials used for farm operations and family living.

An unfavorable symptom is the possibility that aggregate crop production will be greater next year due to yields per acre more nearly normal than those of 1930. But, the outlook is for moderate supplies of live stock and live stock products.

Larger production usually is associated with lower total returns, but there are exceptions when demand changes are most important. Small yields in 1930, for example, failed to increase total income over 1929.

Some Definite Recommendations

One effect of the disillusionment of the cities as to the ease of getting something for nothing may be a re-

vival of interest in farm land as an investment. City real estate and securities in many cases have been a grievous disappointment. The record of farm land values looks better by comparison than it did two years ago.

Specific suggestions as to ways in which farmers can turn the economic situation to their individual advantage are not easy to make. Here are a few.

1. Emphasis on the raising of feeds and turning them into live stock and live stock products rather than on production of cash crops appears advis-

Governor's Agricultural Commission Meets

(Continued from Page 5)

pointed out to the Commission how closely the forestry problem of the State is tied up to that of land utilization and to the other questions involved in this soil survey.

W. G. Howard, Superintendent of State Forests, told the Commission of the progress that has been made under the State's reforestation program. During 1929, twenty counties appropriated about \$68,000 toward reforestation projects. The State contributed about \$48,000 to match this county money for county reforestation work. The State, in general, matches the county appropriation up to \$5,000, but Erie County appropriated \$20,000 and could receive from the State only \$5,000.

Under the State reforestation law passed in 1929, New York purchased about 6,000 acres in 1929 and about 43,000 acres in 1930. There are now fifty-one areas for reforestation in fourteen counties. The average cost has been \$3.73 per acre, and the highest price that has been paid is \$4.00.

Following discussions on land utilization and reforestation by the Commission, a resolution was adopted favoring an appropriation of \$90,000 to complete the survey and study of the

American Agriculturist, January 3, 1931
able in most sections, as has been the case for several years.

2. Improving quality and finding market outlets which pay an adequate premium for it can be used by many farmers to better their returns.

3. While recovery in business doubtless will strengthen prices, a part of the decline in the past year should be accepted as permanent. We are likely to stay on a somewhat lower level than in the last few years. Since we can't expect to receive decidedly higher prices, then we should accept the task of trying to find ways to produce profitably, or, at least, to break even, at the prices we are likely to get. This is hard doctrine, but there appears to be no other course.

agricultural and soil resources of the State.

Another resolution was favored supporting the proposed constitutional amendments originally suggested by Senator Hewitt to reforest a million acres of poor state land. The Commission also recommended that the present county reforestation law be amended so as to allow the State to match county funds up to a total of \$10,000 for any one year instead of up to \$5,000 as at present.

Another meeting of the Commission will be held soon after the Legislative session opens, and our readers will be kept informed of all proposals for the benefit of the rural districts of the State and the progress made by the State this winter in putting these proposals into legislation.

Members of the new Commission with their connections are given below:

HENRY MORGENTHAU, JR., Chairman,

Publisher, American Agriculturist;

DR. C. E. LADD, Secretary,

Extension Director, College of Agr.

COMMISSIONER B. A. PYRKE,

State Department Agriculture and

Markets;

SENATOR L. G. KIRKLAND, Chairman,

Senate Committee on Agriculture;

J. R. STEVENSON, Master Farmer;

I. D. KARR, Master Farmer;

E. R. EASTMAN,

Editor, American Agriculturist.

The following were members of the

new Commission who were not able to

be present at the first meeting:

FRED SEXAUER,

President, Dairymen's League Co-

operative Association, Inc.;

H. E. BABCOCK,

Manager, G. L. F. Exchange;

SENATOR SEABURY C. MASTICK,

Chairman, Senate Committee on Tax-

ation and Retrenchment.

Some Facts About Sweet Clover

(Continued from Page 3)

must be resorted to in order to maintain the milk flow. Often green oats, corn or other crops are cut and hauled to the barn daily. Much of this extra work may be spared if sweet clover pasture is available. It is best not to turn the cattle into it until the plants are ten to fourteen inches high. The crop is then well established and will withstand a lot of trampling. It will generally support about twice as many animals per acre as good blue grass pasture. Depending on the thrift of the crop, sweet clover will carry about two cows per acre from early August until frost. From late in April through July of the second year of growth it will pasture as high as four cows per acre. The usual difficulty is to keep stock enough on it to keep it from getting too coarse. This plant is high in protein and the necessary minerals, especially calcium, and is particularly valuable for milch cows and young stock. Rarely does it fail to increase the milk flow. Less difficulty from bloating is experienced with sweet clover than from other legumes. However, in wet weather some care must be exercised on this point.

The most common objection to sweet clover hay is its coarseness, especially is this true when the crop is used for hay in its second year. When cut and well cured in the fall of the first year, the hay is in most respects equal to alfalfa. When cut in the fall care should be taken not to cut the crop too early or it may be seriously retarded the following spring. Hay from the second year of growth is so coarse that it may be difficult to cure properly. If this second-year hay becomes moldy it is dangerous to feed to cattle. It affects the animals blood and in some manner destroys its clotting ability. This may result in bleeding to death, even from a minor injury. Doctoring is of no

value. The one safeguard is to feed no moldy sweet clover hay.

Makes Excellent Legume Silage

Because this plant is still comparatively new in agricultural practice, not all of its usages have been fully developed. From the results secured by those who have tried it, sweet clover appears to have a bright future as a silage crop. At the Kemptville Agricultural School, Kemptville, Ontario, Canada, it has been used exclusively for silage for the past eight years. The biennial white blossom is seeded in the spring with oats, wheat or barley. The next year the crop is cut with a grain binder at about the time when the first blossoms appear. At this stage maximum tonnage is secured without too high a content of fibre. The silage cutter should be set up ready to operate before harvesting so that the crop may be ensiled before too much drying and wilting occurs. The clover should be cut into short lengths—the shorter the better. Distributing and thorough tramping in the silo is also necessary for first quality feed. Sweet clover silage is superior to other legume silage as it does not become slimy and ill-smelling. A good crop will yield from eight to ten tons of silage per acre.

Cultural Methods

Best results in securing a good crop of sweet clover in New York State have been obtained by sowing unhulled or unscarified seed in December or January on a corn or grain stubble field which has previously been disced or plowed and harrowed. The unhulled seed has a heavy waterproof seed coat which retards germination until spring. A good practice is to broadcast the seed during the January thaw on bare

ground or snow. Being a legume, sweet clover seed must be inoculated for best results. This is done by mixing the seed with a commercial culture or with soil from another sweet clover field. Mr. L. W. Kephart of the United States Department of Agriculture has found that double inoculation is well worth the extra time and effort required. He advocates that several hundred pounds of old sweet clover soil be spread on the new field in addition to inoculating the seed with a prepared culture. The inoculant is the same as that used for alfalfa. The plant grows well on relatively poor soil, provided the lime requirement is fulfilled. In soils deficient in phosphorus a moderate application of super-phosphate is also apt to be a good investment.

When seeded in the spring a nurse crop of oats, wheat or barley should be used. In Ohio, oats have proven the most satisfactory. In some localities where winter wheat is a leading grain crop, the clover is often seeded on the wheat anytime during late fall or early winter. For fall and winter seeding the unhulled seed should always be used but when sweet clover is seeded in the spring or summer the hulled or scarified seed is best. Twenty pounds of seed per acre is generally sufficient to produce a good thick stand; more may be used if desired as the seed is not expensive.

In conclusion it might be well to mention again that sweet clover is an outstanding pasture and soil improvement crop. It is comparatively easy to raise if the lime requirement and inoculation are not neglected. Considering its rapid rise in popularity during the past decade, it would be surprising indeed if most members of the A. A. family are not growing it as a regular crop in their rotation, within a few years.

A Pat on the Back

DURING the year we receive many letters of thanks for our assistance in settling claims of our subscribers. It is true that our subscribers often neglect to thank us, but we know that this is caused by thoughtlessness or lack of time and that they really do appreciate the help we have given them.

At the same time, it is seldom that we get a letter which warms the cockles of our heart as much as the one which follows. We say in reply, "May our representatives who call on you always merit the nice things said of

preciate it if you will mail us a check and upon receipt of same we will mail Policy and Membership Contract and Card.

Inasmuch as the letter from the Republic Service League mentions an accident insurance policy, we wrote to the State Insurance Department to see whether the Republic Service League was authorized to sell insurance in New York State. The reply from the Insurance Department is as follows:

I am in receipt of your letter of the 28th making inquiry in connection with the above named concern. In reply would advise that the said concern is not authorized by this department to transact in this State the business of insurance, and if it is doing so it is violating the law. I have written to the said concern at the address you have given for the purpose of investigating its activities and you will be advised with reference thereto at a later date.

Steals Apples—Pays Fine

I was told I should write to you of catching some young men in the act of carrying some apples away on October 9th.

One man was setting a crate of apples in the roadway near outside road and left hastily when I came in sight and asked what he was doing. It was evening and I went nearer and saw four run off as I asked what was going on. There was a car parked a way off in the opposite direction to which they ran to get out of my sight. It was moonlight. A neighbor came with two hired men and detained the young man who was in the car until the other three showed up.

The Constable was called and the fellows were taken before a Justice and fined \$10.00 each except the man who owned the car and didn't come back. He was fined \$10.00 more. Thomas McCracken was the Constable and Grant Gleason the Justice.

WE always appreciate it when subscribers tell us of incidents of this sort. We are particularly glad in this instance to see how the case was handled. In the first place, the person who detected the theft acted promptly in notifying the police officials, and they in turn, acted promptly and severely in fining those who were stealing property which did not belong to them.

Have You a Friend in This List

IN several issues during the past few weeks we have been giving you the lists of subscribers who received indemnities from the North American Accident Insurance policies in various counties.

This week we are giving them in Wyoming and Yates Counties. We do this to give you the true picture of the wonderful service which these subscribers have received at low cost.

We believe that if more of our subscribers would stand on their rights and have persons arrested and fined who walk away with farm property not belonging to them, that it would go a long way toward discouraging this sort of petty theft.

Law on Dog Quarantines

What can you tell us as to the provisions of the night quarantine on dogs in Albany County? Is it possible to use dogs for coon hunting at night so long as they are under our direct supervision?

ANIGHT quarantine on dogs in Albany County was put on in the following towns, becoming effective December 3, 1930: Berne, Bethlehem, Coeymans, Colonie, Green Island, Guil-

Satisfied

ON October 25, 1930, I received the sum of \$17.85 from the railway, due me as one-half of the freight on my purebred Percheron mare that I had shipped from Rochester, Ohio. Upon arrival of this mare the railway charged me full freight which I was forced to pay. But as all purebred breeding stock are shipped at half rate I placed the matter in the hands of the Service Bureau of the American Agriculturist for collection. If it had not been for them I never would have been able to collect it. This is the second time they have served me and I swear by them as being honest and reliable. Many thanks to the A. A. as well as those connected with the Bureau. I expect to continue on as a satisfied reader of that farm paper.

derland, Knox, New Scotland, Rensselaerville, and Westerlo. Under this quarantine all dogs must be securely confined between sunset and one hour after sunrise. There is no provision for dogs used in hunting coons after dark.

Wherever the State Department puts on a night quarantine it is almost certain to stir up considerable dissatisfaction and for this reason, the Department never puts on a night quarantine except on recommendation from the Board of Supervisors. Such formal request was made by the board of supervisors of Albany County because the records showed that in several towns an unusual amount of dog damage has been done during the past few months.

No One Wants An Accident

IAM sorry that I neglected writing to you before.

I received the accident check and you don't know how pleased I was. Everybody said I wouldn't get anything, but they can see now that you are a company that does exactly as the policy agrees.

I hope before long to get my wife insured. I think it is a good company to be in. Of course, nobody wants an accident, but those things will come. And it is a good thing to be protected. And as I said once and will say again, I want to thank you most heartily. I am getting along fine.

(Signed) Mr. Lewis Jackson,
Poughquag, N. Y.

Mr. Jackson received a fracture of the third and fourth metacarpal bones of the left hand in an automobile accident Sept. 6, 1930. He received \$40.00 indemnity.

them and may the Service Bureau always be as successful in straightening out your difficulties."

"My husband received \$37.50 in settlement of his claim. I don't think he would have received it without your help for they never recognized our bill when my husband took it to them two months ago. Of course, we are very grateful to you people.

"We have lots to thank the good old A. A. for. One instance was in April when a picture agent was through this place with those pictures where you draw a chance for a free picture. My next door neighbor and I knew they were no good for we had read of their scheme in the good old A. A.

"Last night your agent called and we renewed for three years and my husband took the accident policy up again which had been let run out. I'll tell you what we like about your agents. They never have any hard luck stories about trying to get through college or to be a missionary or any of that bunk, but always have a pleasant word to the youngsters and a cheerful word for the older folks. They are always welcome to the few minutes it takes for their business from all the farm folks I am sure. With the best wishes for still greater success to the A. A. and the Service Bureau."

MRS. JAMES E. SELFIDGE
Ancram Lead Mines, N. Y.

Not Licensed to Do Insurance Business

On the 4th of September I made out an application to the Republic Service League and paid down \$6.50 with the understanding that I should receive a policy for the same. Now they write and tell me I should send the balance of \$12, then I will receive the policy. Is this firm reliable or is it a fake?

OUR subscriber inclosed a letter from the Republic Service League which read as follows:

We have your letter regarding your application and wish to say that your Accident Insurance Policy is ready to be mailed to you but we have no man at present to send out to you. We will ap-

WORLD'S GREATEST SALVE MADE FROM SHEEP'S WOOL

**CORONA Wool-Fat Ointment Discovered
by Ohio Man Has Many Uses**

A wonder ointment with amazing healing properties is the discovery of Mr. C. G. Phillips of Ohio. Compounded from the oil secretions extracted from the wool of sheep, it gives quick and positive relief from Cuts—Sores—Burns—Scalds—Boils—Corns, or any flesh wound on man or beast. Even stubborn cases of Eczema—Chapped Hands yield to its soothing and healing powers.

For live stock troubles such as Barb Wire Cuts—Sore Shoulders—Collar Boils—Grease Heel—Caked Udders, or any wound, it has no equal.

Mr. Phillips wants every household to try his wonderful healing ointment. He will send a liberal Free Trial package to anyone answering this ad.

GIVEN—DURHAM—DUPLEX Safety Razor

As an extra special offer we will also give everyone answering this ad a genuine Durham-Duplex Safety Razor who will send 10c to cover packing and mailing cost. Use coupon. Free Sample and Durham-Duplex Razor will be sent at once.

CORONA MFG. CO.
1616 Corona Bldg., Kenton, Ohio
I am sending 10c for sample of Corona Wool-Fat Ointment and Durham-Duplex Razor.

Jim Brown's New COPPER STEEL FENCING

*Lasts at least Twice as long
as Fencing Without Copper
—And Costs A Lot Less*

Saves Half Your Fence Expense

I've declared WAR on RUST — the enemy of all fencing! Actual tests **Prove** that steel, *Mixed with COPPER*, is **two to five times** more durable than non-copper steel! Jim Brown fencing is made of **Copper Steel Wire**. It's the greatest improvement in fencing in 50 years. Besides, every inch of it is **super-galvanized** with a thick heavy coating of **pure zinc** to make it **still more rust proof**! Why buy thinly galvanized fencing that has no copper mixed in it when Jim Brown's **copper steel, super-galvanized** fencing actually costs less?

DIRECT FROM FACTORY—Freight Prepaid

For 42 years I've been dealing **direct** with farmers. My 3 big factories now supply over a **million customers**. My business has grown because my Straight Line Selling Plan means **Economy**. Why not join this big army of money-savers who now deal with Jim Brown?

Another thing. I pay the freight. My catalog quotes **delivered** prices. No guessing, no figuring, no chance for overcharge. Easy to compare with local prices. No extras when you buy by mail from Jim Brown. I've **always paid** the freight and **still do**! And you get 24 hour service from one of my factories or from my 35 conveniently located shipping points.

EVERY PRICE CUT

My 1931 prices are the lowest in 15 years! I've slashed and cut until everything in my catalog is the biggest bargain you can get **anywhere**. My customers **know** that I've always saved them money. This year I'll save my customers more money than **ever before**. Don't buy a thing until you first get my new low prices!

EASY PAYMENTS

Don't put off making improvements on your farm just because you haven't the ready cash. A small down payment is all you need. Pay balance on easy monthly terms. Protect your stock and crops, hog down corn, re-fence your fields **this year**. Buy many other farm and home needs shown in my catalog and **pay later**.

FREE! My 1931 Bargain Book

Bigger and better than ever. 162 pages. Lower prices, greater values. **BARGAINS** in Fencing, Gates, Steel Posts, Barb Wire, Metal and Roll Roofing, Paint, Baby Chicks, Netting, Poultry Supplies, Harness, Lawn Mowers, Nursery Stock, Gas Engines, Washing Machines, Feed Grinders and many other Farm and Home Needs. Don't miss this great 1931 **Guide to Greatest Economy**. Makes your money go farther than you think it can! Write me **today—NOW**. Mail coupon or post card to my factory nearest you. — *Jim Brown*.

SHRINES OF AMERICA

Old North Church
and Paul Revere's Home

"Taxation without representation is tyranny!" cried the colonists, and punctuated the remark with a Boston Tea Party. Other acts of threatening rebellion brought ship loads of British troops to calm the situation. Just a peaceful "army of occupation," but it stirred the colonists to open rebellion. Rumor said British troops would march inland from Boston. Paul Revere, a Boston silversmith, left his home (upper right) one night and waited with horse across the river for a signal from Old North Church (upper left) which would tell him how the troops would move. A lantern flashed in the tower; the troops would move by land. Revere mounted his horse and galloped away into the darkness, on a ride that is still carrying him down the pages of history as one of America's most cherished heroes.

Why farmers buy Ford Trucks

ON LANE AND HIGHWAY, from the field to mill or elevator, and on those frequent trips between farm and town, Ford trucks are bringing to farmers everywhere a quick, reliable hauling-service at exceedingly low cost.

The Ford 1 1/2-ton truck is strong and sturdy throughout. Its construction is simple, assuring thousands of miles of service with a minimum of adjustment or repair.

Its 4-cylinder engine develops 40 horsepower at 2200 r. p. m., which is but a medium engine-speed. The 4-speed transmission provides a wide range of speed and power, while optional high or low rear-axle gear-ratios adapt a Ford truck to whatever local conditions it must meet.

Strength is built into the chassis by the extensive use of fine steel forgings, and the use of forty different kinds of steel. Special

steels were developed, each designed to fit the particular needs of each chassis-part. The result is enduring strength without excessive weight or size.

More than twenty ball and roller bearings are used, to reduce friction and wear, to conserve power, and to make service more reliable. Mechanical parts are made with great precision, a feature which improves performance and facilitates the assembly of Ford trucks in large quantity, thus helping to keep their cost low.

Grain-sides and cattle-rack bodies are available with the Ford truck. There is a choice of open or closed cabs, equipped with Triplex shatter-proof windshields. Dual rear wheels are available at small additional cost. Go to your Ford dealer, and let him show you how little it will cost to operate one of these trucks on your farm.

FEATURES of the Ford Truck

40 HORSE-POWER, 4-CYLINDER ENGINE

TORQUE-TUBE DRIVE

CANTILEVER REAR SPRINGS

HEAVY FRONT AXLE AND SPRING

SPIRAL BEVEL GEAR REAR-AXLE, WITH

STRADDLE-MOUNTED PINION

4-SPEED TRANSMISSION

LARGE, FULLY ENCLOSED BRAKES

TRIPLEX SHATTER-PROOF WINDSHIELDS
(FOR SAFETY)

You may purchase a Ford truck or light commercial car on convenient, economical terms through the Authorized Ford Finance Plans of the Universal Credit Company.

Dead Men's Hands

A Fireside Reflection on the Ways of Yesterday

"I AM one of those men who think "Yesterday" a beautiful word; who love change only in its aspect of slow and imperceptible decay. To me, the present is but raw material for the making of the past and I measure experience largely in terms of its value as stuff for memories."

Jared Van Wagenen, Jr.

So writes James Norman Hall and in my own soul I find an echo to his mellow declaration of faith.

Therefore, what I am about to write—if the editor's judgment be charitable enough to give it space—will be only a sentimental reverie—a thing of reminiscence and of dreams. In it there is nothing that will enable a man to fatten his bank account or even add to his store of knowledge—and perhaps to most men it will be folly. It is merely a musing on forgotten things and the origin of it lies in our work during these gray and yet serene November days just passed. I have chosen the title for this screed because we have been undoing and erasing the work of good men dead and forgotten and I am not just easy in my conscience, because we have dealt thus ruthlessly with the things which to them seemed worth while. So this preachment grows out of my fireside reflections concerning how we have been making and again unmaking farm history for these many years.

Rolling Hills Grow Alfalfa

Hillside Farm—the farm of which I write—is made up of two hundred and thirty acres more or less. There may be twenty acres of level flats along the little stream. More than half of it is

By JARED VAN WAGENEN, JR.

just rolling hills—good fertile hills where alfalfa is very much at home. Then there are thirty-five acres of woodland and just about an equal amount of hill pasture, some of it very steep and surely no place for tractors and modern machinery. In the past, only now and then at long intervals have we broken up these hills, and I doubt if we shall ever put plow into them again. If we will be liberal enough with superphosphate, it may be that the grass will not run out.

A Matter of Location

From the standpoint of what the Farm Management people call "Farm Layout," the location of our farmstead is just about as bad as it could well be. By this I mean that our buildings are all grouped in one far corner of the farm—the one corner that comes down and touches the hamlet and the main highway—when judged purely by the standard of farm efficiency, they ought to be somewhere near the center for the sake of the short haul for crops to the barn and for manure away from it. As a matter of fact, some of our always tilled land is almost or quite a mile from our base of supplies—the barn. I suppose I ought to say that if we had it all to do over again, we should rebuild just where we are right now because to be in the center of the little hamlet has advantages that outweigh mere farm efficiency. I remember one bit of whimsically humorous advice which Professor I. P. Roberts gave his class one day almost exactly forty years ago. "Boys, when you buy a farm, don't get one so far from the road that if sometime a stranger should happen to drive into the yard, your children would run into the bushes and hide." It was homely counsel—but sound.

Besides, so far as the location of the buildings

is concerned, my people have been living on this patch of land for a hundred and thirty years and I really ought not to make uncomplimentary remarks concerning the intelligence of my forebears.

The "Upper Barn"

It seems evident to me that a good while ago, we realized that our farmstead location was exceedingly disadvantageous. At any rate, sometime before my father's memory (he would be ninety-five if he were with us) they went back toward the center of the farm and there on a hill top built what we always called "The Upper Barn." It was a good deal of a structure, with a bridge and double driveway to the second story and big bays on either side. I remember that it would, when full, bale out seventy tons of hay. Sometimes—this was before my day—young cattle and steers were "roughed" through the winter there, living in an open shed and going down across the snowy fields to the creek for drink. That was good regulation Animal Husbandry within the recollection of living men. The old barn will always be a part of my earliest boyhood memories but I was not present at its spectacular end some twenty five years ago. It happened that I was on a Farmers' Institute trip in Rhode Island. We had a very unusually large farm crew that day because we were "beating" (i.e. threshing) rye, baling it directly from the machine and drawing it to the car without storing. This three-fold operation called for ten or a dozen men but, after all, it represented the greatest possible efficiency of labor.

It was a cold, rough day in early winter with a howling northwest gale sweeping the country—no decent day to attempt such work. To operate the beater we had the popular rig of that era—

(Continued on Page 6)

Some Terms Used by Breeders

These Definitions and Explanations Will Help You Raise Better Stock

By H. L. COSLINE

Associate Editor, American Agriculturist

ALMOST from time immemorial livestock breeders have prided themselves on saving the best offspring of their stock in order to breed up or improve their herds and flocks. At first, little was known about the laws of heredity, but as men studied the art of breeding a fund of knowledge was gradually gathered until now the livestock breeder can, to a certain extent, follow definite rules and need not depend on blind chance.

In this connection an explanation of some of the terms commonly used may interest our readers. We hear a lot about heredity. What does it mean? It is usually defined as the tendency of offspring to resemble their parents. This law is so generally accepted that we expect the offspring of high producing cows to be heavy producers and that the offspring of prize winning sheep or hogs will have, to a certain extent, those characteristics which made their parents outstanding. Without heredity we could have no definite, steady improvement.

If you read a book or bulletin on breeding you will not go far before you will strike the term "variation." In speaking of heredity we often say that like begets like, but not just like. In other words, while offspring resemble their parents they also differ from them in some respects. Sometimes they are not as good and occasionally they are better; that is, they may be better for the particular point which we have in mind. A cow may give more milk than her dam, a horse may run faster than either of its parents, or a hog may dress a higher percentage of live weight.

The fact that animals do vary from their parents makes it possible to select and breed from those that more nearly approach the characteristics we are after. Thus we come to our third term which we can call "selection." A livestock breeder can select animals that have any characteristics he wants and may breed over a period of years animals that will approach some ideal he may have in mind. For example, a Holstein breeder might select all animals that had a certain color marking. In the course of a lifetime he might get a strain of Holsteins, all of which had the same markings. However, in this process it is probable that he would select animals that had the right markings regardless of their

milk production and the chances are that after he got the new strain their milk-producing ability would be lower than our best Holsteins today. Likewise, a man might breed poultry for unusually large combs; horses that had unusually bad dispositions; or for that matter, any possible kind of an animal he might happen to want. Remember, however, that this is a slow process and must be followed generation after generation. The encouraging thing about the situation is that we do not have to start where our parents or grandparents did. Rather do we start where they left off. In other words, we take advantage of the work done by previous generations.

Mutations May Improve a Breed

We might say that selection is the basis for all improvement in breeding, but this would not be exactly true. Perhaps you have read of "mutations," sometimes referred to as "sports." This name has been given to the offspring which differs from its parents in some marked detail. If it is a true mutation this difference will also occur in the offspring; that is, if you can get two animals which are alike in this radical difference from their parents, the offspring for the future generations will have this same characteristic. Just as an example, the lack of horns in cattle is usually a mutation, and most of our Polled breeds have started in this way and not because the horns of each generation were a little shorter than their parents, until they disappeared entirely. Mutations may, or may not, be an improvement on the parents; sometimes they are and

(Continued on Page 16)

A group of Connecticut high school boys learning how to judge dairy cows. This is important but it is just as important to be able to breed high producing individuals.

Thought for the Week

MAKE a rule, and pray God to help you keep it, never, if possible, to lie down at night without being able to say, "I have made one human being, at least, a little wiser, a little happier, or a little better, this day."

—CHARLES KINGSLEY.

Buying Potatoes—A Consumer's Experience

IN line with the little stories of consumers' experiences in purchasing food products, which we have been telling lately, let us give you this time a friend's experiences in buying potatoes.

This friend was a former farmer boy, accustomed to having a cellarful of potatoes and to thinking of potatoes in terms of bushels. So he never could quite get used when he moved to the city to the average city consumer's habit of buying a few pounds of potatoes and taking them home in a paper sack.

He, therefore, arranged every year for several years to have his entire year's supply of potatoes shipped to him from farmer friends up-state. You should hear him discuss his experiences in a half-peevish, half-humorous manner.

"Never again," said he, "will I buy potatoes in this way."

"Tell us why," we urged.

"Well, in the first place, by the time we had paid the farmer's original prices, plus the freight or express and city delivery charges, the potatoes always cost us more than we would have paid if we had bought them from the local retail store.

"We would certainly have continued, however," said our friend, "if we could have depended upon the quality. Here in the city store, I can see what I am buying, and if, sometimes, I get fooled on a purchase, the poor potatoes only last a short time and I can try again. But when I bought them from up-state farmers in quantity, if the quality was bad, then I was stuck on my entire season's supply, and I am sorry to say that the quality was bad at least half of the time.

"It seems strange that there was such variation in quality when I bought my potatoes from the same man year after year, but evidently the varying soils on the same farm and the varying weather conditions caused a great difference in the quality of potatoes.

"Another thing," continued our friend, "was the great lack of uniformity. We sometimes got potatoes from our farmer friends varying in size

anywhere from butternuts upward. We like baked potatoes, but it was almost impossible to pick out a mess for baking all of the same size. The result was that the little ones would be done long before the big ones.

"So finally I gave up. Lately we have been buying Idaho potatoes. I feel a little guilty because I was raised in a potato section in the East, but it is nice to get potatoes all of the same size and that can be depended upon for high quality. I'm even willing to pay more for them."

Have You An Old Horse?

A NEWSPAPER clipping on our desk tells of the death of a horse recently that was thirty-seven years old. Up to the day of her death she had worked regularly, being used to draw a milk wagon.

Horses are sometimes rather irritating "critters," but nevertheless, there is something a little sad in their passing. One cannot work for years with a faithful horse without acquiring a real liking for him. He becomes almost a member of the family.

It has occurred to us that a page of pictures of old horses would be interesting to our readers, so we will pay three dollars apiece for the pictures and brief histories of the five oldest horses that our readers will send us. Pictures may be snapshots, but they must be clear or we cannot use them. State the age of the horse, and in a paragraph or so, give briefly his life history. This little contest will close February 14th.

Forests Will Come Again

OUR sons will live to see the forests come back to the old hills of the East, and what a fine thing this will be. Not only will the forests make lumber available and thereby largely pay for themselves, but moreover they will conserve the water supply, break the winds that howl across the hills, make a refuge for game, and turn ugly, denuded, and worthless hill lands into growing forests.

With the first year of operation of New York State's new reforestation program, forty thousand acres of abandoned lands have already been purchased and planted, and two large nurseries for growing trees have been started. The State program contemplates the planting of a million acres, chiefly in the rural farming sections and where farms have been abandoned and are now growing weeds and brush. The average cost per acre of land purchased so far has been about \$3.50 per acre.

Looking Forward

A STORY is told of a farmer who was notorious for his swearing. He had a most terrific vocabulary which he freely used on any and all occasions.

One time this farmer was going up a steep hill with a double wagon box filled with loose potatoes. The tailboard came out and so did all of the potatoes. The farmer stood and looked at the catastrophe, while a friend who was with him held his breath expecting a great burst of profanity. But the farmer said nothing. When the friend wondered why, the farmer explained that he had used up his vocabulary on smaller occasions so that there was nothing left!

We were reminded of this old Chestnut when somebody called our attention to the fact that farmers are doing very little complaining over the present hard times. Reports of the national meeting of the American Farm Bureau Federation at Boston and the National Grange at Rochester, and of many meetings and contacts with our farmer friends that the A.A. staff has had, all indicate that the most cheerful class of people in America today are the farmers themselves. Maybe he used all his complaints on lesser occasions.

It is a fact that the farmer ordinarily does find a good deal of fault with conditions, but when real trouble comes he is apt to show more cour-

age and faith than any other citizen. That is true now. Instead of dwelling upon experiences of the past year, there is a decided tendency to turn their backs upon 1930 and to look forward with courage, faith, and hope to the new year.

Russia Will Grow More Wheat

THE United States has approximately 235,000,000 acres of soils adapted to growing wheat, while Russia has 855,000,000 acres.

In comparing these two figures, one can easily see what is going to happen to America's wheat export trade providing Russia can learn to farm those wheat acres efficiently and Russia is learning rapidly to grow wheat. Great tracts of land are being operated as single units under the direction of skilled experts and with modern machinery.

The outlook is not particularly encouraging to American wheat growers, but neither should it be discouraging to a class of intelligent farmers who have always been able to adjust themselves to meet changing conditions.

Food Exports Fall Off

ALTHOUGH the export of farm products is small compared to what we use at home, yet these exports are large enough to affect prices which farmers receive very materially. It is always the surplus, even though it is small, which makes the difference between profit and loss for the farmer. If that surplus can be exported it solves the problem.

Therefore, it is interesting but somewhat discouraging to know that during the fiscal year ending with June 1930, the exports of foodstuffs from the United States were the lowest in value since the World War. The total value of all foodstuffs exported during the past fiscal year was \$658,000,000, compared with \$806,000,000 for the previous year, and \$834,000,000 for 1928.

As to the reasons for these declines in foreign markets for American farm products, probably the chief one is the fact that Europe and other countries are getting in better position to feed themselves.

Eastman's Chestnut

YOU may recall the experience that we related here last fall which Orrin Terry had in hunting woodchucks when he visited George Duff. Orrin sent word ahead that he wanted some good woodchuck hunting, so George shot a woodchuck beforehand and propped him up on a woodchuck hole for Orrin to shoot at.

I told the story here and evidently Orrin never forgave me, for a short time ago, I was asked to speak at a meeting in Syracuse and shortly after I accepted, I received the following letter from Orrin:

"I notice with glee that you are on the program. I'll be there!

"Over-ripe tomatoes may be hard to find, but I happen to know that we have some nice, soft, water-glass eggs in the cellar. Oh, boy, what an opportunity!"

The joke of it was that I was sick and unable to attend the meeting, so shortly after, I had another letter from Orrin telling of traveling to Syracuse to attend a meeting with pockets bulging with ripe egg-fruit, only to find that I was not there.

You may recall, also, the story told here recently about Charlie Taylor and his experience with a game warden when he was on a fishing trip. Shortly after the story appeared, I received the following letter from Charlie:

"I have a reason to suppose that you thought there was something funny about that chestnut in your otherwise estimable paper of December 6th. Having heard from this from many directions, I have made up my mind to turn from fishing to hunting and will have my \$7.50 Sears and Roebuck 10-gauge shotgun loaded to the muzzle the next time you come to Ithaca. It has a long range!"

Editors have their troubles.

Ninety Years in Retrospect

Other Letters on Taxation, Horning Bees and the Glimmerglass

IT would seem very appropriate for the farmers, many of whom are to do the assessing, to recognize the change that has come over the whole tax situation.

It is quite generally recognized that real property, as a whole, is carrying too much of the burden of government by tax, as compared to the other forms of wealth. While being less than one-third of the wealth of the state, it pays two-thirds of the cost of government. The present system was established when nearly all the wealth of the state was in land and buildings. But the system did not change with the changed condition. As a result, we find many properties (principally country properties) taxed more than their net earnings.

Recently a ray of hope has been sighted, in the way of a court decision. If this decision is comprehended by us farmers, it can go farther toward giving "farm relief" than all the laws we can get passed within the next generation.

The case was brought about for the reduction of the assessed value of a hotel in the village of Hamilton. The previous valuation was established at \$93,800, but now reduced to \$51,450. Judge Sinn, in rendering his decision, said that the board of assessors did not take into account the possibilities as a money-maker, or its earning power, therefore, the reduction.

That is exactly what we have been contending for these last ten years:—**THE EARNING POWER OF FARM PROPERTY CAN BE AS ACCURATELY DETERMINED AS CITY PROPERTY, PUBLIC SERVICE CORPORATIONS, PERSONAL PROPERTY, OR OTHER FORMS OF WEALTH. ANY ASSESSOR WHO DISREGARDS THIS ELEMENT IN ESTABLISHING A VALUE, IS NOT FIT FOR HIS JOB.**

That is exactly what this court decision means.

The Judge says farther:—"I do not believe the owners should be penalized—in having to pay taxes on a full structural value of a money-losing hotel."

Certainly, the courts cannot discriminate between the methods of determining the assessed values of farms and hotels. If the earning power of one is to be considered, certainly the other has the same right.

The State Tax Commission has advised in years past, that the sale between a willing buyer and a willing seller determines the value. Now, that the courts have decided that the earning-power can be a factor in arriving at the real value, no farm property need be assessed for more than its rental income would warrant.

For example: A farm, whether occupied by its owner or a tenant, should not be assessed for more than \$3,000, unless it can show income in excess of \$300, after paying labor, upkeep and depreciation, insurance and taxes.—M. L.S.

Looking Back for Ninety Years

IT is not often one has the interesting reminiscences of an aged parent to appreciate, but I enjoy those of my father, who is nearing his 98th birthday. When young he was an almost indefatigable worker in the harvest field, with a cradle, and also a very swift worker with a scythe, doing a large amount of haying and harvesting for the neighbors each year. He early learned the mason's trade of his father, working beside him until at the age of 17, he lost both parents, which left him with four younger children to look to him for their support.

Believing in a just God, he diligently persevered against adverse circumstances. In slack times of work at his trade, he plied the flail, the well-known method of threshing in that day, though always for but a mere pittance.

Great and wonderful are the changes time has wrought and the reflections

of an old person must be very pleasant indeed. To have seen crude, unwieldy implements laid aside for the perfect machinery of later years and then to come to the time of ever-increasing uses of electricity is a marvelous experience. In startling contrast to those early times is the statement that a mule turned on electric light. One morning at 3:30 I awoke to see our barn windows alight. Arousing the men they found that a mule, becoming loose, had nosed around in the feed room and must have surprised himself when he switched on the light. I think Ted thought he would get an extra breakfast and no one knew it, but not knowing how to turn off the light, he was caught.—Mrs. F. J. B.

Gold Has No Value!

I WAS very much pleased to read the article in the A. A. about the amount of gold in New York City and your statement that the bushel of potatoes was the same value at all time and it was the money that changed in value.

No statement of facts was ever made clearer. Potatoes have a life-giving value for man or beast. Gold has no value of its own. It will not sustain the life of man or beast for a minute by itself. Many cheaper metals are much more serviceable for our practical needs; gold serves for nothing but looks.

Yet, owing to laws and usage, the whole so-called civilized world is snarled up in or by it and the better citizens sold into slavery to pay a profit on it and its assistants, untold billions of paper wealth, scraps of paper with a little ink on them. Millions of people are living from a rake-off on this scrap of paper without giving any service to humanity, while hundreds of millions are robbed of part of their honest earnings to make it possible.

As to the changing value of money, you have only to go to the report of the government survey which says 72 billion dollars in 1922, owing to decreased purchasing power of the dollar, was only equal to 16 billions in 1912.

Did you ever stop to think when you

spill a pint of milk or smash an egg or when an out-building burns, on an abandoned farm, that the world is poorer? These things have a true value. They can be used to sustain life and comfort to humanity. Did you ever stop to think that if all the gold in the world were to be sunk some dark night in a storm in the deepest part of the deepest ocean, and all the paper wealth should burn the same night, the world would be out only the lost heat from the burning paper and the shine of the gold—and some convenience!—E. G. P., N. Y.

Charivari

IF he has lived in the days of "horning bees" surprise awaits one who looks up the meaning in the dictionary where it parades under the name—charivari. "A mock serenade of discordant music, kettles, tin horns etc. designed to annoy and insult. It was first directed against widows who married again at an advanced age; but is now extended to other occasions of nocturnal annoyance and insult."

Can it be that Mr. Webster was ever visited by the aforesaid serenaders? If so he surely lacked the spirit of fun and cooperation shown by at least one bridegroom.—Nearly all newly-weds were visited by a jolly band of fun-makers, in certain rural districts a few decades ago, no insult being intended or suspected).

At nightfall, after his marriage, young men of his acquaintance assembled, not themselves only, but also a notable array of noise-producing articles, and were raising a sort of pandemoniac racket outside his home.

They soon noticed a lad with low-drawn slouch hat who was making merry with the rest and who, upon inspection proved to be the bridegroom. Upon being recognized he treated the crowd to cigars and they, after wishing the couple much happiness, went home.

Insulting? Not a bit. Noisy? Emphatically, Yes. A charge of gunpowder placed between two anvils and ignited by a fuse makes a loud noise when it "lets go"; and the sort of

racket that can, by proper manipulation, be coaxed from a band-saw in the hands of an expert must be heard to be appreciated.

Cow-bells, dinner-horns and one or two conch-shells, that when blown send their weird, eerie moan a mile or more, furnish grace-notes that fill the pauses in real charivari music.

Usually a half-hour or more of it awakens the bridal-couple and they appear to do the honors of the occasion.—M. C. S.

The "Glimmerglass"

LAST summer we spent a part of a day at Otsego Lake, which played such an important part in many of Cooper's tales. The lake in its setting of wooded hills must present much the same appearance as in the thrilling days of which Cooper wrote. Although an improved road extended part way around the lake and there was a steady stream of traffic, we had only an occasional glimpse of the blue-green water through the trees as we drove along.

At Three Mile Point we found a sign that read "tourists welcome" and after eating our lunch by the roadside, walked down to the beach where we found pavilions, tables, and benches provided for picnickers, a boat landing, and, best of all, a splendid view of the lake. The lake steamer, Mohican, makes three trips daily from Coopers-town at the lower end of the lake, to Five Mile Point and the upper end of the lake, stopping at various places to take on and discharge passengers.

Otsego Lake does not appear to have become modernized and commercialized like so many places have been and it would be quite easy were one of an imaginative turn of mind, to find some secluded spot along its shores and live again in imagination the thrilling scenes in Cooper's tales of the "Glimmerglass."—E. M. N., N. Y.

Farming in 1790

FARM journals weren't so much way back in 1790 but even the most conservative and literary publications of the time included some more or less valuable hints for agriculturists.—Witness the June issue of the "American Museum or Universal Magazine" for that year, devoted not only to extracts from the will of Benjamin Franklin, who had just died, but to hints for wheat raising, remarks on the "unprecedented drought" and the eccentricities of Pennsylvania weather.

Endorsed in no uncertain manner by General George Washington under date of June 25, 1788, the Museum contained political and manufacturing news, short and highly romantic fiction, scholarly accounts of the discovery of Vinlan by the Icelanders, verse, and society items.

As to wheat raising, the anonymous contributor who explains "what experience has proved to be the surest and best method ever practiced in this country" urges that "in the winter a sufficient quantity of manure be carried on and as soon as the frost is out of the ground, the ground be ploughed over smooth, furrowed, and potatoes planted." He suggests two cultivations with the plough and goes on, "About the 20th of August, you will find that the tops die; then pull them, for the longer they remain in the ground, the more water they will collect in their substance."

Then the hogs were turned in so that by the middle of October "they will have torn up and mixed the ground better than six times ploughing." Then, "draw off the potato tops and harrow the ground for sowing wheat. The advantages hereby derived are that the potatoes kill every species of weed and turf and the hogs, by rooting and turning the soil in search of the potatoes,

Dusting the Shelves

By DR. J. W. HOLLAND

The A. A. Philosopher

MERCHANTS all over the country at this time of the year are busy taking stock; balancing books; examining shelves to see what goods they have on hand; dusting off the shelves; putting the goods carefully back. It is the one chore about business that most men detest but it must be done at stated intervals in order that they may know where they stand, and whether or not the business is solvent.

Dr. John W. Holland

The human heart is like a business. Let's examine our hearts and dust off the shelves of it; strike a balance and begin again.

Have you made any new friendships this year? New appreciations of other people? New discoveries of excellence in others that you did not have last year?

Has the shelf on which you keep your faith in God, in other folks and in yourself become depleted during the rather hard economic strain of the last twelve months? Is God of chaos uppermost in your thought?

Do other people seem to be but sniveling, grovelling money-grubbers? Or do you see that these are but surface things, and that underneath and back in their hearts are the reservoirs of love and ten-

derness and chivalry that make them akin to the Heavenly Father?

Are you short on faith in yourself, in your ability to achieve?

There is never a time when we can't stock up on faith.

Do you have any old hatreds on your shelves? Some of these come from the settling of wills; some come through jealousy and misunderstandings in the community; some of them may exist even between husbands and wives, and parents and children.

It is bad stock; better take it out and junk it. Put up the spirit of understanding and sympathy and kindness in its place.

Have you checked up on your habits?

One or two bad habits, persistently indulged in, will make a sorry mess of most any life. Do you incline more easily to certain actions that once shocked you? Does the alarm clock of conscience arouse you less easily with reference to certain actions and thoughts. Dust off those old shelves and start some new thoughts and actions which will grow into finer and happier habits.

Do you find yourself praying as easily and believably as you once did?

There is a moral and spiritual guidance for every normal human being, but it is a guidance which needs to be sought by prayer and right thinking.

My hope and prayer for you all is that the New Year may be fine, happier, more God-led than any year you have ever lived; that health, happiness, hope and Heaven may be more and more in your thought.

HAPPY NEW YEAR

A.A.'s Western New York Farm and Home Talk

A Christmas Vacation

THE Christmas period is always a welcome and a delightful one and it is heartening to note that it is becoming none the less so as the years go by. Especially in this time of emphasis upon the economic, is the social and spiritual viewpoint and expression of Christmas time both a relief from the stress of life and an encouragement to better things.

M. C. Burritt

Probably like most other A. A. farm readers we have spent the holidays quietly at our old farm house with the customary Christmas tree, presents, big family dinner, exchange of greeting cards with near and dear friends, reading, visiting, listening to Christmas music over the radio, etc. All this is good for all of us for it is an emphasis that we need. It ought to make us appreciate more our homes and the privileges of our times. The American farm home is the greatest place to live in the world.

All Snug for the Winter

Of farm news, there isn't much at this time of the year. A walk back over the farm found all snug for the winter—old trees hoed around to clear away growth which might harbor mice, young trees with wire guards up, ditches opened through all low spots and tools and equipment put away in the shed. But no sooner is the effort to close up the last season's work rewarded with success, than our thoughts turn to new work and new plans for the coming year. Already some have begun the winter's pruning. Where this has been kept well in hand the job is not a hard one. And there is the season's wood supply to get up and manure to get out by bob-sleigh and plenty of chores and odd jobs.

With labor abundant and to be had at less cost than in many years and with prices of materials down, it is a good year for those who can afford it to make many long neglected repairs

and improvements. We are now overhauling and adding to our tool shed. And we hope during the season to rebuild the walls under the barn, straighten up an old building, take down some old fence, clean up a hedgerow, and make the inside of the house a little more comfortable and convenient and easier to care for. All this can be done for a third to a half less than it would have cost a few years ago. And it will also make work for some who may need it to support their families during a winter when many are out of work and without a means of support.

Planning Ahead

It is a good time of the year also to study the past year's business, discover its mistakes and plan for the coming season. So we have spent a little time summarizing our 1930 accounts and records and making plans for 1931. We shall not change the general type of farming, nor the principal crops grown, but we are eliminating

some minor enterprises, and enlarging major ones. By removing fences we will be able to enlarge fields and to consolidate acreages which ought to result in somewhat lower costs of growing. By comparison with other years certain facts are obvious and these we plan to apply. The alfalfa acreage has been enlarged and our three biggest cash crops, cabbage, tomatoes and beans will be emphasized.

At this time of the year, reading should occupy a large place in life. As farmers, I do not think we do reading enough. We think we do not have time but everyone has time to do what he most wants to do, so it is more or less a question of desire. Reading broadens one's outlook and stimulates as well as informs the mind. And with children it may cultivate the imagination, set up ideals of chivalry and good deeds, and have an important influence in shaping character. Many times in these notes in winters past I have alluded to the pleasure and satisfaction one family finds in reading aloud before the open fire place. Even though the children are growing up they still enjoy it and this week it has been a daily pleasure to read again to the boys—for the third or fourth time, I think—the daring and good deeds of that bold mythical outlaw, Robin-hood. And Dad enjoys it fully as much as the boys!—Hilton, N. Y., Dec. 28, 1931.

Dead Men's Hands

(Continued from Page 3)

a portable steam engine with a wire-screen bonnet or "spark arrester" a top the stack. We were burning wood with the engine a rod or two outside the barn and to the windward. In the light of subsequent events, I wonder why we ever tolerated such an arrangement.

Anyway, in the middle of the forenoon a spark blew under the barn and when they found out what was going on, there was hardly more than time for the men on the mow to save themselves. The heater, being on wheels with the pole sticking out of the barn was pulled to safety but everything else including the press and most of our farm implements went. Fortunately the gale did not blow toward our little village or we might have had a tragic disaster. The wind did carry brands to astonishing distances and a stump fence across a fourteen acre field and on an opposite hillside was fired in several places.

Well, the farm tradition of an "upper barn" was so strong that we promptly rebuilt it—upon a much smaller and less elaborate scale. Somehow or other we never made very good use of this new barn—mainly I suppose because we ceased to grow rye or hay for sale. Sometimes it would be filled with timothy of the class that makes poor cow feed and later this would be baled and sold. Some years it stood empty.

Of late years the comparatively new structure had begun to go to pieces—primarily because the heavy bridge wall began to crowd over and to carry the whole barn with it.

Now a Tool Shed

So last spring we decided that the best use we could make of the old barn, was to tear it down and rebuild the old material into a tool shed—a pretty big one by the way—28 by 72 feet with a metal roof. For the first time in our farm history we find it an easy matter to house all our tools.

Now I am coming to the facts which suggested this paper and the reference to "Dead Men's Hands." After the barn was torn down there still remained the old foundations and the heavy bridge wall together with the earthen embankment which formed the driveway to the second story. It has taken us just about a week to draw away the bridge wall and then level off the great mound of earth enough so that it can easily be worked over with modern machinery. The wall we have handled with team and wagon and a 15-30 tractor pulling our especially big stone boat (11 feet in length). The mound we have leveled or spread with the tractor, hauling a steel grader and ditcher and dragging down possibly a ton of dirt at a time. It beats the old dump scraper a dozen ways.

But, in doing this work I have a

curious feeling as if we were grave robbers or had been desecrating sacred things. Every man who had any hand in the building of this bridge-way has been long dead—so long that no living man remembers him. But, after all, perhaps they builded better than they knew, for the monument they reared we have only imperfectly removed. We shall plow and reap over it and know what it signified but perhaps two or three centuries from now when the traditions of the farm are all forgotten, some fool geologist will come along and fall into a learned discussion as to what freak of the ice age deposited this curious little mound of loam on the smooth contour of the rolling hilltop—and I—I shall not be there to explain the matter.

And so—by my fireside I am in spirit the companion of these Dead Men. I see the bridge wall rising by the site of their great new barn. I see the patient red oxen as they strain into the yoke to drag the loads of dirt up the slope of the growing mound and I hear the shouts of him who drives them. I see the pioneers bending their strong backs to their heavy toil. I hear the chaff and laughter with which farm men have always beguiled their long days. I know that they were good men—mighty in faith and hope and courage—and across the golden years I give them Greeting and Hail—and Farewell.

For large-growing varieties of apples such as Northern Spy, Baldwin, Rhode Island Greening, McIntosh, and King, set in good orchard land, forty-five or fifty feet is good spacing. An additional space of two and a half to five feet permits the fillers to remain three or four years longer at the time when they should be producing.

FEED THE MASH THAT MAKES MORE EGGS HATCH

Insure Against Sterile Eggs, with the Mash KNOWN to be Potent in Vitamin E

This takes a lot of the "luck" out of getting fertile eggs. Everybody wants them. Hatcheries pay a fancy premium. But how to get greater hatchability seemed to be a mystery.

Three years ago, science found that lack of Vitamin E in the feed is the great enemy of fertility. Your best laying hens usually lay out more of *all* their vitamins during the fall faster than they take them in from feed.

So Pratts now give hens an extra supply right in the laying mash. Enough Vitamin E is now guaranteed in Pratts to prevent sterility due to lack of this vitamin.

Think of it! Your best birds, the very ones from which you want hatchable eggs, can be saved from "burning out" their vitamins. Not only this precious Vitamin E. But growth and health Vitamins A and B, and sunshine Vitamin D are also supplied in *extra* amounts in Pratts.

No mere advertisement can tell the full value of Pratts new term for its line of feeds "complete in vitamins." Just as fertile eggs

depend on Vitamin E—egg-production, body-weight, flock-health, outdoor pep, depend on Vitamins A, B and D. Pratts now guarantee an effective amount of each in every bag of mash.

Don't take a chance with any mash questionable in complete vitamin value. With Pratts you can be sure that layers get enough of all vita-

mins even in mid-winter. See your Pratt dealer. We will send you his name gladly. He also supplies a buttermilk baby chick food and buttermilk growing mash. An important member of this feed line is a remarkable broiler mash that makes big fat broilers mighty quick. Try it for either battery or semi-confined birds.

THE POULTRYMAN'S VITAMIN GUIDE FREE

Every poultryman is curious to know the facts about vitamins. Pratts have prepared a vitamin guide, giving complete, up-to-date information. Send for it free and postpaid. Pratt Food Co., 124 Walnut St., Philadelphia, Pa. Dept 16.

Maine Farmer Raises Potatoes at New Low Costs

Increases Quality and Yield Per Acre During Past Season with General Purpose Wide-Tread Tractor

Mr. George J. Brown, Prominent Farmer of Presque Isle, Maine, Presents Some Facts That Are of Interest to Every Grower of Potatoes and Other Row Crops.

Of the increasing number of farmers in the potato-growing sections of New England who are owners and satisfied users of general purpose wide-tread type tractors, there is none more enthusiastic than Mr. George J. Brown, Rural Route No. 1, Presque Isle, Maine.

Always on the look-out for new ways of reducing costs and increasing profits on his farm, Mr. Brown was quick to see the possibilities of this new type of tractor power in the production of potatoes and other narrow-row crops. Strongly convinced that the new power-operated equipment was what he needed, he purchased in the spring of 1930, a John Deere General Purpose Wide-Tread Tractor, John Deere Two-Row Tractor Cultivator, and Hoe, John Deere-Hoover Two-Row Potato Digger, John Deere 4-Bottom, Two-Way Power Lift Tractor Plow, and a new John Deere Power-Driven Mower.

Plants About 10 Acres Per Day

In the Brown farm, there are about 200 acres, 88 of which were planted in potatoes last season. The planting was done with the tractor and the two-row John Deere-Hoover Planter at the rate of about 10 acres per day.

Mr. Brown plowing frozen ground in fall of 1930 with his John Deere General Purpose Wide-Tread Tractor.

Mr. Brown states that although 1930 was considered an adverse growing season for potatoes, he has never grown a larger crop per acre or produced as good quality. He says, "I am positive that these results were due largely to the looser seed bed and the better cultivation which the tractor made possible."

Cultivates and Hoes 18 to 20 Acres Per Day

After the potatoes were in, came the job of cultivating this big acreage. With the two-row cultivating equipment, Mr. Brown cultivated the entire tract of 88 acres.

Mr. Brown states: "The quality of the cultivating work was excellent. The one-man, power lift tractor cultivator and hoe worked to my entire satisfaction in every way. With it, I can get and maintain the depth of cultivation and the size of hill desired, regardless of soil conditions. I consider once over with the tractor cultivator and hoe is as good as twice over with horse-drawn equipment."

His John Deere Used for Many Other Purposes

When there is work to do in the field or on the belt, Mr. Brown puts the General Purpose on the job.

The tractor was used for plowing, harrowing, mowing, and for digging the potato crop. With the Tractor

and the John Deere-Hoover Two-Row Digger, from 8 to 10 acres of potatoes were harvested in a 10-hour day.

Big Saving in Wages for Hired Help

It is Mr. Brown's opinion that the John Deere General Purpose will cultivate and hoe as many potatoes as four men with four teams. He says: "The tractor

Digging potatoes at rate of 8 to 10 acres a day in one of Mr. Brown's large fields.

saved the wages of two extra full-time men; besides releasing the regular men to do odd jobs which would otherwise require hiring of extra help."

Likes the Low Fuel Costs of the John Deere

When asked what features of the John Deere particularly appealed to him Mr. Brown named the following: "the one-man, power-lift tractor cultivator and hoe unit, the two-bottom, two-way power-lift tractor plow, the simplicity, easy-handling, easy-starting and power of the tractor, and the money saved by using 12-1/2 cent fuel oil instead of local gasoline at a cost of 21.2 cents per gallon, net."

"I find that with the tractor I can get my soil in

John Deere Two-Row Tractor Cultivator and Potato Hoe, the outfit that enabled Mr. Brown to do the work that ordinarily required four men and four teams.

better condition and my crops planted and cultivated more timely than I could with horses."

Mr. Brown increased the acreage of his farm after buying the tractor, by purchasing an adjoining 60-acre plot.

This is the accomplishment of one farmer with the John Deere General Purpose Wide-Tread Tractor. What Mr. Brown is doing is not a sensational agricultural stunt, but is simply an instance of good, intelligent farm management. What he has done is within the power of every farmer to do.

Write for Free Booklet

See your local John Deere dealer about this money-making equipment. A letter or post card from you will bring an interesting booklet that tells all about the John Deere General Purpose Wide-Tread Tractor and its equipment. With the A. A. Vegetable and Crop Grower

Salt for Wireworms

I want to ask how much salt and what kind you use to one acre of potatoes for conquering the wire worm and how much phosphate you may use to the acre. I am anxious to raise a good piece of potatoes. —J. F. H., N. Y.

WE do not consider salt a desirable treatment for wire-worm control because of its bad influence on the soil in its effect on subsequent crop yields. Presumably 500 to 1000 pounds per acre of salt would make the soil sufficiently toxic to eliminate wireworms. However, we find that where sufficient salt to control wireworms is used, the stands of potatoes following are extremely poor. Kainit, a source of low-grade potash, has also been used for this purpose but with the results described above. Kainit is composed principally of common salt in combination with potash. We are finding it desirable to urge potato growers troubled with wireworms to avoid old sod land, to practice short rotations, and to grow either leguminous crops or buckwheat previous to potatoes.

The amount of superphosphate desirable to use on potatoes will depend upon soil type and quantity of manure used, if any. On our heavier soils where stable manure is applied liberally, we recommend the use of superphosphate rather than a complete fertilizer. Ordinarily, 50 pounds of superphosphate to each ton of manure will provide a system of balanced nutrients for the potato or any other crop grown under these conditions.—E. V. HARDENBURG.

Dimensions for a Standard Crate

TO make a standard potato crate have slats seventeen and fourteen inches long with twelve inch posts, says Professor E. V. Hardenburg of the New York state college of agriculture. With one inch square posts and three-eighths inch slats, the inside dimensions are sixteen and one quarter by fourteen by twelve inches deep. Such a crate holds a legal bushel of sixty pounds; for estimating bin capacity it occupies one and one quarter cubic feet.

Nitrogen for Celery

IN Ohio the use of a nitrogen carrier gave a marked increase in the growth of celery. Four hundred pounds per acre of a readily available nitrogen carrier used as a side dressing produced an increase of over 8,000 pounds of celery per acre.

All plots in the experiment received a basic treatment of a half ton of a 2-8-16 fertilizer. In comparison to the marked increase from the additional nitrogen, doubling either the potash or superphosphate increased the yields only about one-tenth.

Flax Growing Is Coming Back

THE growing of flax was an old-time farm industry in the early days of American farming, but with the coming of other crops and farm enterprises, flax growing gradually disappeared. It is extremely interesting to note, therefore, that now the culture of flax is coming back. It is the current answer to the ever-present question, what shall the farmer grow to get away from wheat, corn and cotton? Oregon, for example, hopes to have 50,000 acres or more in flax before long. The North Dakota Agricultural College is putting on a campaign to get Dakota and Minnesota farmers to substitute flax for spring wheat on several million acres this year.

The American Flax Corporation has developed machines which apparently reduce flax growing and processing as

completely to machine operations as has been the case with wheat growing and milling.

In recent years, we have been importing 20 to 22 million bushels of flax seed and small amounts of linseed meal each year. The average yields of flax in the United States have been approximately 8 bushels per acre. This would indicate a home market for possibly an additional three million acres of seed flax. Three million acres is a lot of flax, but it does not amount to much compared to corn or wheat. Three million acres would scarcely be missed from our 57 million acres of wheat or our 100 million acres of corn.

Nevertheless, it is a step in the right direction, to find other products and other markets in the place of those that are now overdone.

Rotation to Include Potatoes

What is the best rotation to be followed where potatoes are the main money crop?

Of course, in some of the important potato producing sections potatoes are grown on the same land year after year. In Aroostock County, Maine, we understand that a common rotation is potatoes, oats and clover. In this way, the potatoes benefit from the clover sod and of course, there is likely to be less trouble from disease and insects than where they are grown on the same field year after year.

Controlling Bean Anthracnose

"Can bean seed be treated to control anthracnose?"

ALTHOUGH anthracnose is a fungus disease carried by seed no satisfactory treatment has been found which will cure the disease. About the only practicable control measure is seed selection and this must be done in the field. This usually consists of hand selecting enough disease free seed to plant a seed plot and then using the beans from this plot to plant in the field.

Acid Soil for Egg Plants

THE New Jersey State College finds that egg plants on highly acid soils are less likely to be damaged by wilt than on soils containing lime. Egg plant wilt is caused by a fungus which is carried over in the soil and which attacks the plants early in the season. So far, no effective treatment has been found other than to avoid the application of lime on fields where egg plants are to be grown.

High Points in Scientific Plowing

By DR. M. C. SEWELL,
 Associate Professor of Soils,
 Kansas State Agricultural College

THE largest item of expense in producing cereal and annual forage crops is tillage.

The most important tillage operations are plowing and cultivating.

Reduction in depth or frequency of plowing, or number of cultivations necessary for economic yields, materially reduces the cost of raising the crop.

Plowing deeper than six inches for cereals or row crops—excepting root crops—is never warranted.

Timeliness—early plowing—is the important factor in wheat tillage—July-plowed ground produced eight bushels to the acre more than September-plowed ground.

Nitrogen conservation is the thing for which the farmer plows, not moisture conservation.

The dust mulch is no longer considered a useful practice.

Cultivation sufficient to keep down weeds is all that is necessary—additional plowing is wasted.

Efficient tools, especially power equipment, is of utmost value in tillage in the light of discoveries as to the value of timeliness in plowing.

Cultivation to be effective against quack grass must be thorough, frequent, persistent, and properly timed.

SCIENCE looks back THOUSANDS OF YEARS

and solves a secret of THIS YEAR'S Crop Success for you!

GIGANTIC upheavals of the sea. A rugged continent is formed. Centuries of raging, roaring storms...ages of beating, bleaching sun...countless years through which all the forces of Nature have been at work creating limitless deposits of Chilean Nitrate.

At left, 41 bu. of wheat grown on 1 acre, fertilized with 130 lbs. Chilean and phosphate and potash. At right, 27 bu. from adjoining acre fed only with phosphate and potash—no Chilean. A clear gain of 24 bu. due to Chilean.

Now modern science, by independent investigation along new lines, discovers new facts about this amazing product of Nature's laboratory.

Those tremendous natural forces, which created Chilean Nitrate, put into it many so-called "impurities"—the rare elements, iodine, boron, magnesium. Each of these, science learns, plays its own part in feeding plants and making them healthy. Chilean Nitrate, because of its natural origin, is more than just nitro-

gen. It is **Nitrogen Plus**. That's why it is so much more profitable to use on wheat, corn, fruit, truck and pastures.

New 100-lb. Bag Lowest Price!

Chilean now comes in new 100-lb. bags. Better condition. Easier to handle...the bag without a backache. AND Chilean is now being sold at the lowest price in the last 25 years. Place your order now.

Specify "Chilean" when you order nitrate. The name Chilean is the most important thing to remember when you order fertilizer.

The Cost of Producing Milk

I AM a reader of your paper and like it very much, but of necessity disagree with some things that are printed.

I have a herd of purebred Holsteins—T.B. Tested—have belonged to the Dairy Improvement Association, and am obliged to obtain my living, the education of our children, and spending money from my business as a dairyman.

In the issue of your paper of Dec. 6th in notes from your farm you gave an interesting account of your dairy's breeding and production. You close with this statement—"It seems to me that any dairyman who expects to stay in business during these difficult times will find it necessary to have a real knowledge as to the cost of producing milk, and the only way I know of getting the facts and figures similar to those I have given above about my own herd, is for a dairyman to be a member of some kind of a dairy testing association." The thought is implied that the cost of the milk has been found by the figures given.

The point I would like to make is that the method employed by the Dairy Improvement Associations does not give the whole cost of the production of milk, but only about one half the cost as I shall prove later. A half truth is a most dangerous proposition upon which to build. A bank or business concern would think it ruinous and preposterous to draw conclusions for their future where only one half of their production costs were entered.

The most annoying thing about this is that these figures are published in the papers and our city friends, the consumers, do not understand the added cost and think the dairyman is a profiteer and is getting more than he should. As it now stands the average dairyman thinks he is not losing money on his low producing cows and keeps them. If the whole cost was figured he could see the loss and dispose of them. It is a rather lazy and indolent method of arriving at a very important point that is misconstrued and misinterpreted by nearly all concerned—Strong language but it is backed up by the facts.

Our dairy interests are looming large. Let us adopt strictly business methods, like those of other business

concerns, and know as near as possible the costs. Let us explain further—Taking the figures of the elements that enter into the production of 100 lbs. of milk, on a yearly basis, as formulated by Professor Warren and unanimously accepted by the Federal Farm Board as a basis of cost for fluid milk.

The Elements are: 33.79 lbs. grain, \$.64.2; 43.3 lbs. hay, \$.25.8; 10.8 other dry fodder, 5.4; 92.2 silage food, \$.27.6; 8.3 lbs. other succulent, 2.5; 3.02 labor at 30 hr., \$.90.6; Total, \$2.16.1.

This does not include bedding, use of cans and hauling milk, ice, depreciation on dairy and barn, interest on investment, taxes, insurance, veterinary service, insecticides, sprays and many other small items which in all adds another 25% to the cost, as allowed by the Federal farm board.

Adding the 25% to our other costs of \$2.61.1 brings the total cost to \$2.70 per 100 lbs. at present. Some changes should be made for lower per cent of butterfat.

Our feed costs are \$1.25.5—just a little less than one half of the total cost. The simple matter of doubling the feed cost would come very near the total cost of milk. Dairyman generally are striving to produce as nearly an even flow of milk as possible, to care for the demand.

The cows are in all stages of production, some giving 60 and some 6 lbs. according to their period of lactation. It is unfair to figure on high production alone. The cow must be maintained at low production, and when dry, and all is the cost of producing milk. The yearly balance sheet is the only fair method of figuring.

Let us look into the new publication of Henry and Morrison—"Feeds and Feeding" to see how the figures here presented compare.

The Ohio Experiment Station says that it costs \$153.29 to keep a cow a year. Other Stations report as follows: Wisconsin, \$188.21; Minnesota, \$112.18; Iowa, \$143.66. The average of these four Stations is \$149.85, which it would seem, is a fair estimate.

The same Stations give the average cost of producing 100 pounds of milk. The Ohio figure is \$2.61; Wisconsin, \$2.65; Minnesota, \$2.19; Iowa, \$3.15; or an average cost for 100 pounds of milk as figured by these Stations, of \$2.65.

The cost seems high to us because we are not taught to figure the whole cost. It would probably cost more to maintain a cow here than in those western states. Considering the recent drop in the price of milk a 5000 lb. yearly production of a cow would probably lose the dairyman about \$40.00 or putting it another way he would sell labor, silage, home grown grain and hay considerably below the market price. Putting the proposition up as the dairy improvement association does this 5000 lb. cow would pay a nice profit over feed costs.

Lincoln said—Let the people know the truth and the whole truth and the

(Continued on Page 22)

What Kind of Records?

WE agree with "Dairyman" that the cost of feed is only about 50 percent of the cost of producing milk. We also believe that it is important that every dairyman should realize his costs. We wonder, however, what is to prevent the Dairy Improvement Association member from figuring his total costs? We wonder if the man who stays out of the Dairy Improvement Association is any more likely to get the accurate cost of production figures, than the man who is a member?

We have seen dairymen secure excellent results from figures obtained through these Dairy Improvement Associations. In this case we doubt greatly whether half the truth, as "Dairyman" calls the figures secured, is worse than no records at all.

We admit that the complete figures would be more valuable, yet the method of figuring employed by the associations is much simpler than that suggested by our reader. We will be glad to have our readers give us their opinions, either for or against "Dairyman's suggestions."

Registering Meritorious Grades

I AM an admirer of the Guernsey Breed and knowing that it has nothing to conceal will use it as an example of our present day dairy breeds. This breed originated on the Island of Guernsey where monks selected animals that met the most rigid requirements of a dairy breed. But it was not until 1891 that the door was closed to all importations of foreign cattle. Because of this fact when the first Herd Book was published in 1882 it contained animals that were black, black and white, brindle, red and red and white. These were the purebreds of less than fifty years ago. Therefore I believe that any discerning breeder of to-day should have the privilege of advancing his grades into one of the five dairy breeds if certain strict requirements are met under the supervision of the particular breed association.

Our dairy of grade cattle is kept primarily for milk production and so is that of every other dairyman. The quantity and efficiency of this production hinges upon three factors—true-ness to breed type, inherent producing ability and the prepotency of the sires. Therefore if these factors can be instilled into our grades, why, after the passage of several generations are they not good enough to be purebreds? So I believe that the idea of registering meritorious grades is based upon: First—that a sire whose daughters show uniformly high producing ability that is consistently better than their dams is homogeneous for the hereditary factors determining high production, and; second—that by the continued use of such sires for ten generations a pure line of producing ability will be established.

I have set the standard of ten generations because, after that, on an average only one calf out of a thousand would revert to its mongrel parents.

If such a plan was used it would be a stimulus to raise the standards of the breed and its popularity. It would increase the selling value of the animal and its progeny which is the main argument of such a plan as it would give the breeder of limited means a chance to do his part, and receive his reward, toward the ideal of the industry. And when we realize that the average butterfat production per cow in the U. S. is less than 190 lbs. per year and that less than 3% of the dairy cattle are purebreds, then as whole-hearted dairymen we feel the acute need of a system which will allow our meritorious grades to become purebreds.—Lewis Gay, Warsaw, N. Y.

Drinking Cups Increase Milk Field

A DAIRYMAN recently said that of all the improvements that he had put into his dairy farm the one which brought him the most returns in actual dollars was drinking cups for his cows. Another dairyman found by actual figures that the drinking cups not only saved a lot of work, but have also greatly increased the milk production of his herd. Every farmer who has drinking cups knows that cows, like people, drink more often when the supply is convenient, particularly when they are eating. At least four pounds of water are required for each pound of milk produced, so that any increase in consumption of water is usually followed by a correspondingly larger milk yield.

Niggardly feeding of good cows is mistaken economy; likewise, liberal feeding of poor cows is just as poor practice.

This Good Cream Separator Increases Dairy Profits

THE dairyman who owns a McCormick-Deering Cream Separator has a big advantage when it comes to profits. He has the *closest-skimming cream separator* and this means he is getting the maximum amount of butter-fat produced by his herd. The McCormick-Deering proved its remarkable efficiency in hundreds of public demonstrations the past year. Babcock tests showed it skimmed with a loss of only one one-hundredth of one per cent of butter-fat. This unusual performance was accomplished regardless of whether the temperature of the milk, at the time of skimming, was hot, cold, or in-between.

You will be well repaid by having a McCormick-Deering on your farm. It is correctly designed all the way through. It has perfect balance, ball bearings at all high-speed points, and runs with minimum power. Features of sanitation make it easy to clean. The McCormick-Deering will give you perfect satisfaction for many years to come. See the McCormick-Deering dealer in your community for a demonstration. Write us for catalogs.

McCORMICK-DEERING Ball-Bearing Cream Separators

"LOWER COSTS MEAN HIGHER PROFITS"

Which of these Extra Dollars could you use?

\$20.85 more from every acre of corn.
\$25.00 more profit from each cow.
\$ 1.22 more per 100 lbs. of beef raised.
\$.35 more on every 100 lbs. milk.

EXPERIMENT station tests definitely prove that this extra income results when silage is fed instead of dry fodder. Experiment station tests also show that a Papec Ensilage Cutter requires less power per ton. Many Papec owners pocket as much as \$75 to \$100 extra corn profit each year because their silage costs them just that much less money.

E. R. Pennebaker, Thompsonstown, Pa., says, "Last year it cost me \$1.00 a load to fill. This year with my Papec it cost me only 20 cents a load." Soren & Sons, Northfield, Minn., say their Papec "cut their filling time squarely in half, a saving of \$75 in labor alone."

More Papecs are in use than any other make because Papec saves a man at the feed table, does not clog, lasts longer and gives better service.

Send for free Feeding Booklet

Every feeder should have our new 48-page booklet "More Profit from Home Grown Feeds." Includes valuable formulas. Sent free! Your name and address on postal or margin of this ad will bring it, also our new catalog on Papec Ensilage Cutters. Write today.

Reviewing the Latest Eastern Markets

Milk Prices

January Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		1.86
2A Fluid Cream		
2B Cond. Milk	2.11	
Soft Cheese		
3 Evap. Cond. Milk Powder		
Hard Cheese	1.80	1.60
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for December 1929 was \$3.42 for 3.5% milk and Sheffield's \$3.22 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Situation Unchanged

CREAMERY SALTED	Jan. 2, 1931	Dec. 26, 1930	Jan. 3, 1930
Higher than extra	29	29 1/2	38
Extra (92 sc.)	28 1/2	29	37
84-91 score	24	24	30
Lower Grades	23	23 1/2	28

The situation in the butter market is substantially the same as it was last week, although prices are a shade lower. The decline came on December 31 bringing the price of 92 score butter to 28 1/2c, a 1/2 cent decline. The general uncertainty of the outlook and the fact that most business was over for the week prompted the decline. When business was resumed on Friday after the New Year, there was good buying interest that held the market full steady. However, there was plenty of butter of fine quality available. Most receivers were offering goods freely and we do not foresee any advance in price in the immediate future. Receivers are very anxious to keep their floors as clear as possible and they are therefore not inclined to bump prices. Reports from business circles indicate that we may expect some recovery early in January. At any rate, a more optimistic outlook appears to prevail than was the case during the latter months of 1930. At this moment the trend appears to us to be just a shade for the better. More butter is moving and if matters are not forced too much we may be able to stand a gradual increase.

At the close of 1930 the statistical situation was very satisfactory as far as holdings were concerned. The four cities were holding slightly less than six and one half million pounds under what they held at the same time last year. However, during the third week in December the four principal markets reported an out-of-storage movement that was approximately 1,100,000 pounds short of the out-of-storage movement during the same period last year.

Cheese Market Unchanged

STATE FLATS	Jan. 2, 1931	Dec. 26, 1930	Jan. 3, 1930
Fresh Fancy	19-20	19-20	20
Fresh Average			
Held Fancy			26
Held Average			23 1/2

There has been no change in the cheese market since last week's report, trade in

general being very quiet. Just before the close of the year there was very little business in fresh cheese. Fresh makes are draggy of which the offerings are reasonably free at inside prices, with outside prices extreme, thereby giving a more or less indefinite trend but one that looks to be just a shade downward.

As December came to a close the ten cities reported that they held approximately 2,300,000 pounds less cheese than they held at the same time a year ago. The out-of-storage movement during the third week in January was approximately the same as it was for the year previous. The cheese market seems to be weathering the present depression, as compared with last year, slightly better than the butter market. It takes time for swings to take place and it may be that a little later cheese will begin to feel a reaction. We hope not, although we would like to see butter prices improve.

Egg Market Varies Widely

NEARBY WHITE	Jan. 2, 1931	Dec. 26, 1930	Jan. 3, 1930
Hennery	36	37 1/2	47-48
Selected Extras	34	35	34-35
Average Extras	32	33	32-33
Extra Firsts	29	30	29-30
Firsts			
Undergrades			
Pullets	27	27 1/2	22-24
Pewees			
NEARBY BROWNS	Jan. 2, 1931	Dec. 26, 1930	Jan. 3, 1930
Hennery	41	42	41-43
Gathered	32	40	31-40

There are wide variations in the egg market at this writing and to interpret adequately the market it would be necessary to take up each individual classification and report on it. Top grades of nearbys namely those bringing premiums are moving very slowly and it is difficult to realize any profit for anyone at existing prices. Producers are not getting enough money for this choice product and the dealers are lucky to get cost price to say nothing of a profit. Closely selected extras are selling over a range of 1 1/2c, some Jerseys bringing 36c while other nearbys are bringing 37 1/2c. The market on these lines appears to be one of individual negotiation. When we get to the medium grades we find the market in much better shape. Average extras and extra firsts hold very firm and in some quarters are actually scarce.

It is impossible to make a general statement about the egg market. There are too many factors at work. Cold weather prevails over the entire country and under normal conditions would immediately react in the form of higher prices, due to a diminished lay. This year, however, there appears to be no interruption in the movement of eggs eastward as a great many shipments were held back just previous to and during the holiday period. Furthermore, modern production methods are rapidly eliminating the weather factor. Commercial plants with their heated laying houses are less susceptible to weather changes and consequently we do not get the severe interruptions that characterized the market a few years ago.

As December came to a close the ten cities making daily reports had only about 700,000 cases in excess of their holdings at the same time a year ago. Furthermore, the out-of-storage movement has not only kept pace with but showed a little increase over last year. If the trade does not disturb the present movement of eggs by forcing prices it may be that the statistical condition of the market can be brought around to something like normal by the time the heavy lay starts.

Late Arriving Fowls Suffer

FOWLS	Jan. 2, 1931	Dec. 26, 1930	Jan. 3, 1930
Colored	24-25	23-25	32
Leghorn	20	17-20	28
CHICKENS	Jan. 2, 1931	Dec. 26, 1930	Jan. 3, 1930
Colored	24-29	23-28	24
Leghorn	21-22	20	20
BROILERS	Jan. 2, 1931	Dec. 26, 1930	Jan. 3, 1930
Colored	40-47	45-50	26-34
Leghorn	40-42	40	31
Old Roosters	15	14	17
Capons	40	35-40	34-37
Turkeys	35	25-30	30
Ducks, Nearby	25-30	24-28	20-25
Geese	21-24	18-22	20

Several heavy shipments of fowls arrived via express late December 31 and

on January 2. Naturally, they had to be carried over and they suffered a price decline of from 2c to 3c. For a long time we have been warning shippers in these columns to avoid shipping stock that would bring the merchandise on to the market after the close of business. This year heavy shipments arrived on Wednesday when practically all of the retail buying was over. Also a lot of birds arrived the day after New Year, another bad market day. During periods of prosperity, the day after a holiday is not apt to show much of a break, but under conditions like the present it is a different matter and a dollar is made to go a lot farther. Due to the fact that there is plenty of poultry available it leads us to believe that there will be no price increase over the week end, although stocks should move fairly well at the prevailing rate. Broilers are steady although any increase in supply might possibly cause a revision downward. Chickens are full steady and some choice lines are scarce. A good many coming in are quite staggy. Fancy capons are not too plentiful and are selling readily. Turkeys are not moving any too well. The poultry market has been rather moody of late, so to speak, it has been swinging from one class to another in a rather flighty manner. Turkeys for a few days have been almost entirely ignored. Other lines have been enjoying ready sale, only to be out in the cold in a short time.

Potatoes, Vegetables and Fruits

The potato market continues steady and the trend appears to be on the up-grade. Maines in 150 pound sacks are bringing from \$3 to \$3.15, while Long Islands range from \$3.25 to \$3.40. Bulk goods from Maine per 180 pounds closed at \$3.50 to \$3.75 while Long Islands brought \$3.85 to \$4. In some cases of extra fancy stock premiums have been paid, thereby giving a slightly upward trend.

Cabbage has been experiencing a slightly better inquiry, bulk goods from New York State bringing \$18 to \$21.

Onions are meeting a quiet market, one that is rather irregular and in which an easy tone prevails. Western New York yellows generally bring \$1.10 while Orange County stock brings \$1 to \$1.25 per hundred. A few extra fancy selling at \$1.50. Orange County reds generally bring from \$1.15 to \$1.50 per hundred pounds.

Nearby white turnips are quoted at 50c to 75c per bushel.

Squash is selling a little better. Nearby Marrow brings from \$1.50 to \$2 while Hubbard brings \$2 to \$2.25.

Carrots from New York State are picking up a little, unwashed bringing from 50c to 85c per bag while washed stock brings from 50c to 75c per basket.

Moderate offerings of basket and barreled apples have been meeting a good demand. Prices have been well supported on the leading varieties showing good grading. Ordinary marks still sell slowly. Baldwin, Fall Pippins, Jonathans, Northern Spys, and York Imperials are bringing up to \$1.50 per bushel. Lower grades naturally sell downward some as low as 50c. Fancy Greenings have been bringing as much as \$1.75 with the better McIntosh up to \$2.

Meats and Livestock

CATTLE—One load medium 1265 lb. steers around 25c lower at \$9.25. Few cows, steady; common to mediums \$4.00-5.50; low cutters and cutters \$2.00-3.50.

VEALERS—Fairly active, steady. Good to choice \$12.00-15.00; mediums \$9.00-11.50; cull and common \$6.00-8.50.

HOGS—Steady. Good-choice 160-220 lbs. \$8.75-9.00.

LAMBS—Deck good, 80 lbs. New York lambs around 25c lower at \$8.25. Few common throwouts \$5.50.

COUNTRY DRESSED CALVES—Receipts during the week were fairly liberal, and being a poultry week more than the trade required. Demand was very slow. Prices were slightly higher on top grades all others about the same as previous week. Friday's market very slow. Prices steady but not cleaning up. Fresh receipts, per pound: Choice 14-15c; fair to good 11-14c; small to medium 8-10c.

HOTHOUSE LAMBS—Receipts light all the week. Demand fair. Prices slightly higher. Market steady. Good to fancy, each \$7.00-10.00; imitations, each, \$3.00-6.00.

RABBITS—There was no overstock during the week. The demand was good at

higher prices than previous week on account of the New Year holiday. Friday's supply light, demand slow; market nominal at 20-25c per pound.

Hay Prices Off

Liberal supplies of hay just before the close of the year, coupled with a slow demand in the market weakened the situation to the extent that prices of hay suffered a slight loss. Toward the end of the week supplies were coming in less freely and demand improved, which left the market about the same as it was a week ago. Straight timothy brings from \$22 to \$28, top quality is extremely scarce. Sample hay brings from \$16 to \$20, mixtures have been selling from \$19 to \$25 with No. 1 grades scarce. The market comes to a close on January 3 fairly steady. The straw market is steady. Oat straw is bringing \$12 and rye and wheat \$14.

Beans Dull

The bean market is very dull. Average Marrows bring \$5.50 to \$6.25; Jumbos from \$6.50 to \$7; Pea beans \$5 to \$5.50; Red Kidneys \$9 to \$9.75; White Kidneys \$7 to \$7.75; Round Cranberry \$5.75 to \$6.35.

Hides and Skins

Calfskins, green trimmed, New York City No. 1, 14c per pound, No. 2, 12c per pound; weights 9 1/2-12 1/2 pounds No. 1, 1.80; 12 1/2-14 pounds No. 1, 1.90 each; 14-18 pounds No. 1, 2.10 each; 18 pounds and up No. 1, 3.00; No. 2's buttermilks and branded proportionately less on foregoing weights; Deacons, 60-75c.

Wool

New York better fleece wool, unwashed, fine, per pound: 21-23c; 1/2 blood 22-29c; 3/4 blood 23-28c; 1/4 blood 23-28c; low quarter blood 23-25; common and braid 22-24c.

Honey

Market steady. Per pound: Clover extracted, in bulk, white, 9-10c; amber 9-10c; buckwheat, extracted, in bulk, 8-9c.

Roots and Herbs

Wild Ginseng selling very slowly. Well dried, New York and Eastern States, per pound: 10.50, cultivated Ginseng, according to quality 3.00-7.00 per pound for New York and Eastern States. Farming in 1790

(Continued from Page 5)

effectually destroy all kinds of vermin which have been left in the ground, besides effecting a considerable saving in their keeping."

There had been widespread drought before 1790 so that its effects were still felt. Dr. Benjamin Rush wrote that during two months in the summer of 1782 no rain fell with only two showers in the succeeding months of September and October.

"In consequence of this, there was no second crop of hay; the Indian corn failed of its increase in many places and was cut down for food for cattle. Trees newly planted died. The pasture fields not only lost their verdure but threw up small clouds of dust when agitated by the feet of men or beasts. Cattle were driven many miles to be watered morning and evening. The earth became so inflammable in some places as to burn above a foot below its surface. A complete consumption of the turf by an accidental fire kindled in the adjoining state of New Jersey spread terror and distress through a large tract of country."

It was noted during this dry spell that sheep were uncommonly fat and "their flesh well tasted" while all other domestic animals languished from want of grass and water.

"Crabs," Dr. Rush went on, "were caught more than a mile above the city of Philadelphia in the river Delaware, which is sixty miles above the places in which they are usually found. Springs of water and large creeks were dried up; rocks appeared in the river Schuylkill which had never before been observed by the oldest person alive; they bore the figures 1701."—E. L. W.

Farm News from New York

The Latest Crop Report Figures---Local News

THE latest crop report gives a few figures which may be of interest to our readers.

The 1930 production of Dry Edible Beans is estimated at 22,137,000 bushels, compared with 20,707,000 bushels in 1929 and an average production of 17,325,000 bushels during the five years 1923-1928. The consumptive demand is probably heavier than ever this year but in sympathy with the general downward price trend coupled with the large production, prices of beans are low, \$2.40 per bushel on December 1, 1930 compared with \$3.78 in 1929.

The production of pea beans, mainly in Michigan and New York, which are used both for canning and for sale dry through the retail trade is estimated at 4,811,000 bushels compared with 5,511,000 bushels in 1929 and the 5 year average of 6,039,000 bushels.

Certified Seed Potatoes

Officials report that 35,688 acres of seed potatoes passed final inspection this season compared with the 44,586 acres entered in the spring and 34,116 acres passing final inspection last year. As compared with 1929 there were decreases in the acreage passing inspection this year in Maine, Vermont and Nova Scotia, but these reductions were offset by increases in New Hampshire, New York, New Brunswick and Prince Edward Island.

Production this year is estimated at 9,704,000 bushels or 8 percent more than the 8,926,000 bushels last year.

December Apple Estimates

The 1930 production of commercial apples for the United States is now estimated at 33,723,000 barrels compared with 29,004,000 barrels harvested in 1929, and 32,373,000 barrels the five year average 1924-1928. Carlot shipments moved to date and estimated to be moved total about 110,000 cars compared with 102,722 cars reported moved last year.

The December estimate for commercial production in New York State was 5,375,000 barrels, as compared to last year's crop of 3,404,000 barrels, and a five year average of 4,588,000 barrels. The Pennsylvania figures for 1930 were 1,150,000 barrels, as compared with last year's crop of 800,000 barrels, and a five year average of 1,096,000 barrels.

The Potato Crop

Following a considerable increase in the November potato estimate, the December estimate again cuts the expected crop to a U. S. total of 361,090,000 bushels, compared with 359,048,000 bushels the revised estimate of the 1929 crop, and 392,605,000 bushels the average production of the five years 1924-1928. This estimate is nearly 1 percent greater than the crop harvested last year and 8.0 per cent below the five year average production. The total value of the 1930 potato crop, on the basis of December 1 prices, is 31 per cent less than that of the 1929 crop.

The crop in Maine, New York, New Jersey, Pennsylvania, Michigan, Wisconsin, Minnesota, and North Dakota totals 168 million bushels. This total is 13 million bushels or 8 percent less than the light crop harvested last year in these states. Production in these states is 19 percent below the five year average.

Milk Production

Milk production per cow in New York dairies in December, was given as 14.6 pounds per cow, the same as last year's figures, but larger than the 1928 figures. This December, 26 percent of all cows in New York State herds were reported as dry, as compared with 28 percent a year ago.

Egg Production

Figures indicate an upward trend in winter egg production during the past several years. New York State crop reporters indicated that there were, in December, 119 producing hens and pullets per farm, as compared with 115 in December a year ago, and that they were producing at the rate of 21.2 eggs per day per 100 hens, as compared to 17.2 eggs per day per 100 hens a year ago.

Grass Seed Scarce

Word comes to us that grass seed will be scarce in the United States next spring. We are not trying to paint the blue side of the picture, but suggest that our

readers give unusual attention to selecting their grass seed early to insure that they get good quality. It is estimated that the production of red and alsike clover seed is only about one-half as large as in 1929. The production, however, is slightly greater than the five-year average. Greater demand is anticipated because so many seedlings were killed out by the drought.

sian Club held a fine meeting at the Agricultural School at Canton. About fifty were out. They will stage a banquet in April.

Grange Deputy Albert Hull outlines for the new year, first, a continued increase in membership; second, assisting the Farm Bureau in furthering cow test association work; and third, a material im-

ber and dedicated four new Grange Halls at Mooers, Beekmantown, Chazy and West Chazy. The Grange has a large membership in the county and is steadily gaining.—R.J.M.

Progress in County Forests

DURING 1930, nearly 5,000,000 forest trees were planted in county forests under the Hewitt Law. This Law provides that the state will match county appropriations for county forests up to \$5,000 per county per year. The following counties have started forests under the new law:

County	County App'n.	State App'n.
Cattaraugus	\$ 500.00	\$ 500.00
Chautauqua	1,300.00	1,300.00
Erie	21,056.31	5,000.00
Essex	5,000.00	4,100.00
Genesee	250.00	250.00
Jefferson	3,000.00	2,600.00
Lewis	3,000.00	3,000.00
Madison	500.00	500.00
Montgomery	1,500.00	1,500.00
Oneida	5,000.00	5,000.00
Onondaga	5,000.00	3,632.00
Oswego	3,000.00	3,000.00
Otsego	5,000.00	5,000.00
St. Lawrence	5,000.00	5,000.00
Saratoga	2,500.00	2,500.00
Schoharie	1,200.00	1,200.00
Seneca	250.00	250.00
Steuben	1,000.00	1,000.00
Westchester	2,500.00	2,500.00
Yates	1,000.00	1,000.00
Totals	\$67,556.31	\$48,832.00

Leading Herds for Butter Fat

THE November report of New York State dairy herd improvement associations indicates a total of 68 active associations in New York State, in which records are kept on nearly 30,000 cows. Following are a few of the high herds for butterfat production during the month of November:

County	Owner	Breed	Average Production Per Cow	
			Milk (lbs.)	Fat (lbs.)
1-10 Cows				
Wayne	Frank Chapman	R. G.	1132	58.5
Otsego	Frank Reis	G. H.	1550	49.6*
Niagara-Orleans	B. G. Wilson & Son	R. J.	818	48.3
Cayuga	A. T. Personius	R. H.	1417	47.7
Franklin	Emile Stone	H.	1294	45.0
11-25 Cows				
Tompkins	F. E. Space & Son	G. H.	1488	55.9
Allegany	James A. Young	R. H.	1675	53.5
Chautauqua	G. S. Cowles & Son	H. F.	1507	50.1
Tioga	Geo. Exo	H. F.	1479	50.1
Franklin	Theodore Stone	H.	1270	46.8
26 Cows or Over				
Madison	Robert Ausin & Son	H.	1755	56.3
Ulster	W. E. Bruyn (B. Decker)	R. H.	1396	49.6*

Jefferson	C. R. Langworthy & Son	R. H.	1383	47.1
Tioga	S. A. Seely Co.	G. H.	1322	45.1

*Part of herd milked three times daily.

Timothy seed was about half a crop, while the alfalfa seed crop is seven percent below normal.

Labor Supply

On December 1, crop reporters indicated that the labor supply is 103 percent of normal and that the demand for farm labor is 76 percent of normal.

New York County Notes

ST. LAWRENCE COUNTY—We have had just one of the finest December months we ever knew. There was just enough snow on the ground to call it a white Christmas. Potatoes are selling for \$1. a bushel; oats, 50c; no hay being sold; beef cows, 4c and 5c a pound live weight. The Sheffield milk plant at Heuvelton is doing a lot of building. A weigh stand has been constructed so that a number of patrons can be accommodated at the same time. A cheese plant with twelve vats is reported to be in the process of construction.

Quite a number of the East Lisbon cheese factory patrons signed with Dairy-men's League when the Northeastern Milk Company ceased to take their milk. The sub-district meeting of the League will be held at Heuvelton, "Van Heuvel" branch, in January. Recently the Holstein-Frie-

semen improvement in ritualistic and unwritten work.—H.M.K.

RENSSELAER COUNTY—We have had some rain, but not much. More is needed to fill the ponds and wells. The light snows which have fallen and melted, have afforded some slight relief from drought conditions. Prices for all farm produce are low. Particularly discouraging is the drop in the price of milk and also the price of eggs. Poultry is selling cheaper than for several years past. The lower cost of grains for cattle helps a bit. There is a noticeable reduction in the cost of the necessities of life and in clothing. While farmers are receiving less for their produce they have them for their own consumption and are experiencing no difficulty in procuring all the help necessary for work on their land and wages are much lower. The great improvement in the roads adds mostly to the convenience and pleasure of life in remote sections. The weather has been mild and farm work is well ahead, much plowing has been done this fall. Potatoes are bringing \$3. per barrel.—E.S.R.

CLINTON COUNTY—We had a dry warm fall. Crops were all secured in good condition and more plowing than usual done. Wells and streams are very low. State Master of the Grange Fred Freestone was here the first week in Decem-

State and local agencies in the 36 States which lie in the snow belt cleared snow and ice from 199,348 miles of State and local highways in the winter of 1929-30, according to reports to the Bureau of Public Roads, of the U. S. Department of Agriculture. The cost of clearing 184,748 miles amounted to \$8,224,368 the reports show. About 8,200 miles of snow fence were used last season, an increase of about 40 percent over the preceding winter. The removal of snow from our highways, however, is not considered an unmixed blessing by every producer of farm products. We would be glad to know what you think about it.

The Larry Fay Trial

A WEEK or two ago we said we would keep you informed on the progress of the trial of Larry Fay and other defendants for racketeering in the milk business. There seems to be little to report. The trial drags along, the prosecution presenting many witnesses who are now, or were, in the milk business, and who give testimony showing that Fay interfered with their supply of milk or attempted to intimidate them to get them to deal with the association.

The defense, on the other hand, maintains that Fay's association was formed for social purposes, to prevent price cutting and the stealing of customers by jobbers, and to combat excessive demand by customers for gratuities.

Unemployed Still Sell Apples

SEVERAL times we have mentioned the sale of apples by the unemployed in New York City and our readers may be interested to know that they are still on the job. As we understand it, they are at present buying their own apples independently, but the city is still waiving the requirement that peddlers have a license.

Quite a number of these men have branched out into other lines. Many have added tangerines which they sell two for five cents. Others have added chocolate bars or in some cases are selling chocolate bars exclusively. Conservative estimates indicate that this method of selling has increased the consumption of apples by approximately 500,000 boxes.

Drought and Unemployment Relief

RECENTLY a sub-committee of the House Appropriations Committee at Washington, voted to appropriate \$45,000,000 for drought relief in accordance with the authorization recently approved by the President. It is expected that the full committee will approve the \$45,000,000 vote in a few days.

This sum will be used to aid farmers in drought stricken areas to secure seed, feed for livestock, and fertilizers. At the same time, President Hoover's emergency employment committee announces that public and semi-public building projects, aggregating \$800,000,000 will be undertaken within a few months.

In 20,000,000 wired homes in the United States, surveys show that 80 per cent have electric flat irons, 30 per cent electric washing machines, and one per cent electric ironing machines.

WINTERTIME EGGS

WINTERTIME eggs... of course you're anxious to sell dozens of them. But watch out for the gray months ahead. They're apt to bring cold snaps... thaws... more cold snaps... in quick succession. Hard weather on layers! And to continue regular egg production through this season of sudden changes, your hens must be in top-notch condition. That's why feeding an oatmeal feed is profitable. For oatmeal builds health and energy.

Ful-O-Pep Egg Mash contains pure oatmeal from the same mills that manufacture Quaker Oats.

Of course, Ful-O-Pep Egg Mash contains a balanced assortment of other ingredients too. Ground grain products, cod liver meal, molasses (in dry form) and necessary minerals are blended with the oatmeal.

Each ingredient has its own special work to do. For example, cod liver meal furnishes the birds with the important "sunshine" vitamin (exactly the same as that supplied by the natural rays of the sun). Molasses acts as a mild laxative. The minerals make egg shells and rebuild bones. All of the ingredients combine to make quantities of eggs... hatchable eggs.

And best of all, Ful-O-Pep Egg Mash is most economical to feed. You need only to count the cost per dozen of producing wintertime eggs to be convinced of that. Your local Quaker feed dealer can supply you with Ful-O-Pep Egg Mash. See him at once.

About Battery Brooding

I read your very interesting article on battery brooding last spring and decided it is the only sanitary way to rear chicks. Therefore, by another spring I intend to be in readiness to accommodate at least 4,000 chicks "apartment house style." I would like to know just how the electric lights are arranged for heating. Would an electric heating element be more efficient? How long can 100 chicks be left in an apartment 30 x 36 before it is necessary to remove them to larger quarters?

Is it safe to leave the chicks in an apartment after four weeks of age and how long or at what age should they be transferred to a colony house? In case of no electricity couldn't a hot water system be installed? What arrangements of pipes would you advise? Would a chicks up to four weeks old be comfortable in a brooder apartment located in a room with the temperature at 80 to 100 floor level? Is it advisable to have each apartment dark or just semi-dark? Could cockerels be left longer in an apartment brooder than their little sisters?—L. C. H., N. Y.

BEFORE taking up your question, I want to say a word about your reference to "the only sanitary way to rear chicks." I would prefer to say that battery brooding is *one* of the sanitary ways of starting chicks. To brood the chicks all the way through to maturity on wire floors in a brooder house with an outdoor wire-floored exercising yard is just as sanitary as battery brooding, and for some conditions may be an even better plan. Battery brooding should be considered only as an efficient and sanitary method of starting the pullets, and perhaps growing the cockerels to broiler size. The broilers can be left in the batteries longer than is safe for the pullets.

Hot Water Systems

Yes, there are hot-water systems that are very satisfactory. In fact, if you are planning to start 4000 chicks I am inclined to think such an outfit would be better for you than an electric. I suspect you would find it more satisfactory in the long run to purchase a hot-water battery brooding system than to try to install one. In any case, you will want a set of 8 or 10 pipes arranged with manifolds at the ends exactly as in the sectional mammoth incubators, in each deck of the brooder. These may be connected to a single heater, or you could have a separate heater for each deck. It is very essential that the heat of each deck be controlled independently of the other decks so as to suit the temperature to chicks of different ages. With a floor temperature of 80-100 in the room the chicks in the upper decks would be killed by too high temperature. You must either have the youngest chicks in the upper decks and the older ones which need less heat in the lower ones, or if the chicks are all of one age you will have to install elec-

tric fans to circulate the air of the room fast enough to keep the same temperature at the top and bottom of the room.

Now in case you want to use electricity and to build your own battery you can get electric heaters that do not give off light and that screw into a regular light socket. You should have an electric store order them for you. They would be better than light bulbs which we used for it is better to keep the battery at least semi-dark. The chicks learn more readily to eat and to drink from the troughs on the outside and there is less toe-picking and feather pulling in the darkened batteries.

Now as to the relation of the age of the chicks to the size of the battery section and the number of chicks I am quoting from Mr. Lee of the Beacon Milling Company as follows:

"Number of chicks per 30' x 30' Section.

1st week not over 100 chicks; 2nd and 3rd weeks not over 65 chicks; 4th and 5th weeks, not over 40 chicks; 6th and 7th weeks, not over 35 chicks; 8th and 9th weeks, not over 30 chicks; 10th and 11th weeks, not over 25 chicks; 12th weeks and upward not over 15 chicks."

From our experience I think that pullets should be taken out of the brooders at 4 weeks. Broilers will also do better if they are removed at that age, but they will grow reasonably well up to 2 lbs. in the batteries if given plenty of room.—L. E. Weaver.

Luckemia—A Blood Disease

"We are wondering if you can tell us the trouble with our pullets. They are Barred Plymouth Rocks. They are laying and have been since the first of August when they were four months old. We feed them laying mash with cod liver oil and corn as scratch grain. We can go out to them and they will all be fine and then you can go out within a few more hours and we will find one or two dead. We opened a dead pullet the other day and found her liver about three times the normal size. The egg yolks that were in her were hardened. She was fat, but her liver seemed a strange color, also the other organs seemed mussy. We have lights on them."—R.B.H., New York.

WE cannot tell you definitely just what is causing the death of your pullets but the symptoms which you described as found in the pullet which you opened would indicate that she had Luckemia.

This is a blood disease and may cause the death of the hen within a few hours or in some cases they may be sick for several days before death. One of the characteristic symptoms is an enlarged liver. I have seen cases in which the liver was six or eight times its normal size. In many cases the liver

(Continued on Opposite Page)

A flock of Barred Rocks on the farm of a subscriber, Ward Brothers, Jay, Essex County, New York. Ward Brothers are located near Lake Placid, which gives them an excellent market for eggs and chickens.

(Continued from Opposite Page)

is covered with very small grayish spots although other cases do not show this condition.

In case of Luekemia, an analysis of the blood would show a decrease in the normal number of red corpuscles in the blood and if the hen was sick for a very long time she would become very pale and thin. However, as I mentioned above, some hens have this disease in an acute form and they may die within a few hours. In these cases there may be no external symptoms.

Veterinarians and poultry investigators have not been able to find any treatment for this disease. About the only thing that you can do is to keep the hen house as sanitary as possible. Clean the house frequently and spray thoroughly with any good disinfectant. Keep the house as dry as possible by furnishing plenty of ventilation. The disease seems to be found most frequently in damp poultry houses and in unsanitary conditions.

This trouble may clear up soon with the loss of only a few birds but if your losses are heavy it would probably be wise to dispose of the entire flock, if you have only a small flock and start with new stock next year.—F. E. ANDREWS.

Cull Out Poor Pullets

SOME interesting figures have been secured from a large number of Rhode Island flocks. Nearly ten thousand birds returned between March 1 and September 30, a profit of \$1.91 over feed costs in the case of pullets and \$1.64 over feed costs for the hens. The average egg production was 100.9 eggs for pullets and 94.3 eggs for hens for the seven months.

One lesson learned was the importance of culling out pullets that do not pay their way. A suggestion here is that these non-producers be culled out when the pullet flock has reached about 20 per cent in egg production. At that time those that are unduly slow in maturing can be easily identified. Those that are not producing can be removed to another pen, fed stimulating ration, and then if they do not respond can be sold as unprofitable.

Juniors Market Eggs Cooperatively

WHAT is believed to be the first 4-H cooperative marketing enterprise in New England was inaugurated recently in Belknap County, New Hampshire, by Stanley E. Wilson, county club agent. The plan calls for the re-tailing of graded eggs at a premium of five cents above the regular market price. The eggs are sold in special 4-H cartons stamped with the New England label and bearing the name of the club boy who produced them.

The largest of these junior co-operators is probably Edwin Goodwin of Laconia, who now has about sixty pullets in winter quarters and aims to go into the chicken business in earnest next year by building up a flock of at least five hundred birds.

Treatment for Gape Worms

"I have 125 chicks four weeks old and three days ago they got the gapes. As I have never had chicks with the gapes before I do not know what to do for them. I would like to have you tell me what to give them." Mrs. U. S. F., N. Y.

MAY I first suggest that you make certain that gapes is the trouble in your flock. It sometimes happens that the gasping for breath by chicks suffering from Brooder Pneumonia is mistaken for gapes. An examination of a chick immediately after death will settle the question. Inflamed or congested and discolored lungs indicate pneumonia or some similar trouble. Gapes will be proven by the forked worms attached to the inside walls of the windpipe.

The only treatment for gapes given in the literature is to extract the worms by thrusting a loop of horse hair down the windpipe, twisting it around and pulling it out with the

A truck-load of PROOF

that your hens can lay more eggs

This picture was taken at the poultry unit on the Research Farm of Dr. Hess & Clark, Inc., Ashland, Ohio

IN THIS truck are 21 cases of eggs, or 647½ dozen. In the houses back of the truck are 8 pens of a hundred hens each, or 800 hens in all.

These 8 pens of 800 hens have just finished a year's test at the Research Farm of Dr. Hess & Clark. Four of the pens laid a total of 5077 5/12 dozen, or a 152-egg average per hen. That's some pile of eggs. But the other four pens laid 5724 8/12 dozen, or an average of 171 eggs—and that's a lot more. In exact figures it is 647½ dozen more, or the equivalent to this truck-load of eggs you see in the picture.

These hens are brooder mates, selected carefully and divided evenly. They were fed and cared for alike. And yet one group of 4 pens outlaid the other by 647½ dozen.

Only one thing did the leading 4 pens get that the other 4 pens didn't. They were fed Dr. Hess Poultry Pan-a-min regularly in addition to good feed* and care. That and that alone accounts for the truck-load more eggs they laid.

It is Dr. Hess Poultry Pan-a-min that accounts for high egg production on many a poultry farm, just as it accounted for the increased production in this test. It is Pan-a-min that furnishes the conditioning properties necessary to keep hens in laying trim every day. And Pan-a-min that supplies the minerals needed for vigor and endurance and health.

Give your own hens Dr. Hess Poultry Pan-a-min regularly—day by day. They'll pay you for it in extra eggs. Dr. Hess & Clark, Inc., Ashland, Ohio.

*These hens were fed a mash of ground corn, wheat middlings, wheat bran, ground oats, meat scrap, dried buttermilk, soy-bean meal, alfalfa-leaf meal—a scratch feed of cracked corn and whole wheat—also cod-liver oil and oyster shell. Lights in the morning. All the hens received all these things in the same proportion and in the same way. But no matter what the feed, it is good feed and care plus Pan-a-min that makes extra fall and winter eggs.

Dr. Hess Poultry PAN-A-MIN

keeps hens in laying trim

Just paint the roosts with "Black Leaf 40." The heat from the birds' bodies releases the fumes, which kill lice.

BABY

CHICKS

KERR'S BABY CHICKS WILL NOT DISAPPOINT YOU NEXT FALL

ONLY chicks from heavy-laying stock become profitable egg producers. High egg yield is an inherited quality.

Kerr's baby chicks have a rich inheritance from birds that have made big records in the leading egg-laying contests. Our White Leghorns have official production records up to 304 eggs in a year. Our Barred Rocks have produced up to 277 eggs and our R. I. Reds have laid up to 300 eggs in 365 days.

The prepotency of the Kerr strains of baby chicks for high egg yields is a fixed quality. In addition to heavy egg production, they excel in correct breeding type and lusty vigor, and are available from stock tested for B. W. D. Send for Kerr's fully illustrated Chick Book and the prices, sent free upon request.

(Continued from Page 15)

worms attached. Also, (and this is important, move the chicks at once to different range where you are quite sure there is no infestation of the worms. A treatment which is said by some poultrymen to be effective against gape worms is to dust "London Purple" into the feathers of the mother hen so the chicks will inhale it. The dust is said to cause the worms to loosen their hold and be coughed out. In the case of brooder chicks they may be put into a box and the dust sifted over them through a coarse-meshed cloth so as to keep the air in the box filled with the dust until the chicks have inhaled it for several minutes.—L. E. WEAVER.

Some Reasons for Profits

Why do some poultrymen seem to make more money than others?

THE New Jersey Agricultural Experiment Station states that this is based upon three factors, size of business, efficient production, and labor efficiency.

According to this authority, the man who is running a poultry farm and depending primarily upon market eggs for his income should have a flock of from 1000 to 1500 layers if he expects to get sufficient income to maintain a satisfactory standard of living.

When speaking of efficient production we think of the number of eggs per hen, the feed consumption, the mortality, and all other items which include the production of a flock. The flock with the highest production per bird is most likely to give the best returns.

Speaking of labor efficiency, the New Jersey Experiment Station recommends a daily time schedule as well as a yearly schedule which calls to the poultryman's attention those things which should not only be done right away but those things which should be done in preparation for the month to come. It is important not only that the laborers, particularly if they are hired, should do their work quickly and efficiently but that things should be done on time so that the chickens or hens should not suffer for the lack of something which should have been done the week or the month before.

What Is London Purple?

In an article on raising turkeys by Mrs. M. L. Gordon, she mentioned the use of London purple for gapes. Some of my turks have the gapes now and I can't get London purple here at any drug store. Can you tell me what it is and where it can be procured?—F. E. S., N. Y.

THE question was referred to Mrs. Gordon who replies as follows:

"I am very glad to answer your inquiry regarding London purple. It is a poison that we use here in Ohio to kill potato bugs just as we use paris green to kill them. We can get it at any drug store, twenty-five cents' worth being enough to doctor 100 turkeys a season. Although it is a poison, it will not hurt the poults as they do not eat it, but breathe it in their wind pipes and it kills the gape worm which is a tiny thread-like worm, red in color. I never have killed a poult using it, but have saved hundreds that would have died without it."

Some Terms Used by Breeders

(Continued from Page 3)

when they are we immediately have a big step in advance because, as we said, they breed true. In fact, if they do not breed true they are not a mutation. What about the red and white calves that are apparently born to

purebred Holstein parents? They are not mutations because they do not breed true. In Holland, the original home of Holsteins, they had both red and white and black and white Holsteins. In this country only black and white Holsteins are eligible to registry, yet once in a while the calf will inherit the red color markings, indicating that it is possible for animals to transmit characteristics which they do not possess, or at least which we cannot see.

We cannot go far in the study of breeding without running across the terms "inbreeding" and "line breeding." They mean much the same for inbreeding is often defined as the breeding together of very closely related animals and line breeding as breeding together animals belonging to the same family, but not so closely related as inbreeding. What place does inbreeding have in the improvement of our livestock? For years there has been a common belief that inbreeding is altogether bad and that it results in reduced vigor, reduced size, and loss of the characteristics we wish to maintain. A study of the history of breeding, however, shows that many of our most famous animals have been inbred. Briefly, the facts are as follows:

Inbreeding intensifies the characteristics of the offspring. In other words, both parents, to a certain extent, have the same characteristics and the offspring, as it might be said, gets a "double dose" of these characteristics. If both parents have good characteristics the offspring will be desirable, while if the parents are both poor individuals the offspring will be doubly poor. It seems, therefore, that the bad reputation which inbreeding has developed, has come as a result of inbreeding poor animals. It has been said that inbreeding in the hands of an amateur breeder is one of the worst forces for evil, while in the hands of a master, it is one of the greatest forces for improvement.

Another term that is repeatedly used is "prepotency." This term applied to any animal indicates that an animal has the ability, to an unusual degree, to impress its own characteristics on its offspring. Here again is a force that has been of great value in improving livestock. Many of our important breeds of livestock can be traced back to one outstanding individual.

How can we tell when an individual is prepotent? Apparently there is no way, except by noticing the performance of the offspring. With dairy cattle we are coming more and more to value the herd sire by the production of his daughters and particularly by whether they average better or poorer in production than their dams.

Inbred animals are more likely to be prepotent because, as already stated, they have a double dose of their parent's characteristics. Too often we find that the offspring of a herd sire are uniformly good after he has been killed. Yet, more and more we are keeping records on our best animals and getting the information as to the prepotency of our herd sires.

Sometimes a breeder will speak of outcrossing. What does this mean? Well, he may have been breeding for a number of years and confining the

(Continued on Opposite Page)

WINTER BROILERS

DO YOU WANT to make more money from your fall and winter broilers? Then buy chicks that will live well and grow rapidly. More broiler growers are turning to Hubbard Farms chicks each year because they are assured of uniform quality chicks that will live practically 100% and will make a 2 lb. broiler in eight weeks. They know Hubbard Farms' chicks are always dependable. Every chick we sell is produced from our own strain of Reds, bred for 14 years for vigor and rapid growth. We have 8,000 breeding birds here on our own farms and every bird is blood-tested by the State University. We guarantee full satisfaction on every order. You cannot go wrong with Hubbard Farms chicks. Get our catalogue. HUBBARD FARMS, Box 147, Walpole, New Hampshire.

(Continued from Opposite Page)

members of his herd to a particular family. In other words, the entire herd is more or less closely related. By this process he may have built his herd up to a certain point only to find that the offspring vary little from the parents. In other words, they are all breeding true to their family characteristics, which is a fine thing, yet in a certain sense it stops improvement because as we remember, variation is the basis of improvement. When such a stage is reached some or all of these animals can be bred to a herd sire of an entirely different family. This is outcrossing. This brings into the make-up of the offspring new characteristics and although some of the individuals may be poorer than their dams, some of them, assuming that the herd sire has been wisely chosen, will undoubtedly be better.

We hear a lot about the terms "purebred" and "grades." To some a purebred is an animal that is eligible to registry in some herd book. That, however, is not strictly speaking, a correct definition. We had purebreds before we ever had herd books. The term really means that the breed is pure; in fact, it has no mixture of blood and the offspring all resemble the parents very closely. An ideal situation for the development of a pure breed is an island where there is little or no chance for dissimilar animals to be brought in. For example, two of our outstanding breeds, Jerseys and Guernseys, were developed on islands. Some of our newer breeds of livestock have been started by deliberately crossing two or three breeds and then selecting animals having the characteristics desired. If this process is carried on long enough, a breed will be produced that will breed true. In other words, none of the offspring will resemble closely any of the breeds originally used in starting the breed. Many of our breeds of poultry were originated in this way, as well as a few breeds of larger animals.

A grade, on the other hand, is usually defined as an animal having better than fifty per cent of blood of one of our recognized breeds. We speak of grade Holsteins, grade Guernseys, grade Shropshires, and grade Clydesdales. When we speak of grading up a herd we mean increasing the percentage of the blood of the breed. The first cross between two breeds or between a scrub and a purebred, will contain fifty per cent of the purebred; second, three-quarters; third, seven-eighths, etc., until within a few generations the offspring, so far as all practical purposes are concerned, might be called purebreds. However, they are still grades and the offspring will never be eligible to registry in any of our association books.

A cross-bred animal is a name usually given to offspring of members of two recognized breeds. People commonly cross-breed animals, as they say, to get the good characteristics of both breeds. At the same time, crossbreeding does seem to increase vigor and cross-bred animals are frequently raised for meat purposes with excellent results. The trouble comes when these cross-bred animals are themselves bred. Then we get all sorts of variations and almost always very poor results. In other words, the breeder who is growing cross-bred animals must maintain purebred males and females of both breeds to produce his cross-bred animals, rather than to breed the offspring themselves.

So far, we have been talking about things of a rather technical nature and which may not in themselves suggest a definite program by which the breeder may improve his own herd. In an early issue we will follow this with definite suggestions, based upon the laws and definitions which you have just read.

HILLPOT

Now is the time to adopt a
more productive program.
Let this book help you.

FREE CHICK BOOK

I have put into this chick book the gist of nineteen years' experience—plain facts and practical suggestions. There are feed schedules, rearing charts, house plans, discussions on flock management, schemes for intensive production—all sound, tested information.

The great money-making possibilities of the Hillpot Low-egg-cost breeds are also shown, with many examples taken from the experience of my customers. Send for a copy of this thought-provoking book today.

FAIRPORT HATCHERIES, BOX 44 FAIRPORT, N. Y.

Winter Remodeling

Slack Time in Farm Work Offers Chance to Get Indoor Jobs Done

THE shut-in days of mid-winter are excellent for doing over furniture and other minor improvements that never get done when outdoor jobs are calling. Nothing satisfies a woman so much as to make attractive and useful, something which she had about given up as hopeless. It does not always require a great outlay of money to do this, for there are many inexpensive materials on the market which, when used skillfully, simply work wonders.

Miss Grace Morin of the household art department of the New York State College of Home Economics gives the following suggestions for freshening up a room:

Improvements at Small Cost

"Old or ugly ornate pieces of furniture may be sawed down, painted or refinished, old chairs may be upholstered or covered with attractive slip covers, built-in features may add to the convenience and comfort of the room, and lamp shades, curtains, or rugs may be made at small cost.

For curtains, cushions, bed spreads, and slip covers osnaburg or almanac cloth are good choices, because they are attractive, inexpensive, and durable, and they are easily dyed. Attractive window curtains may be made from ordinary cheese cloth dyed to harmonize with the room and left without ironing. Theatrical gauze is also recommended for curtains because it suits both old and new furnishings.

Disguise Ugly Fixtures

Ugly light fixtures may be disguised by wrapping paper shades or by drums made of paper fastened over a wire frame. Tarnished metal fixtures may be painted with oil paint; they will be less conspicuous if they match the walls of the room. Ordinary webbing used by upholsterers to reinforce springs may be adapted to several uses, such as seats for camp stools and door bags for shoes. Ten-cent kitchen towels, which are of many different patterns, colors and textures, may be used for table runners and pillow covers.

Simplicity should be the keynote in furnishing interiors. When adding new furniture to an old room select pieces which will not make the rest of the room seem shabby by contrast. Bright colors or conspicuous designs often have this effect, while greyed colors harmonize more easily with their surroundings. Neutral backgrounds such as putty-colored walls and dark floors are suggested because these set off rather than deaden the furniture and decorations in the room."

Remedies For House Plants

CONSTANT watchfulness is necessary to keep house plants free from insects. Most of these insects are small, and they may not be noticed until the plant is literally covered. When such a condition develops often the most sensible thing to do is to throw the plant away and buy a new one, says Grace H. Griswold of Cornell University. To keep plants free from insects Miss Griswold suggests three commercial products and home-remedies.

Plant lice, or aphids, are among the common pests. They are small green

insects that reproduce rapidly. A two per cent nicotine dust is the simplest control, and within a few minutes after the dust has been applied the lice drop from the plant. A solution of one quart of water, one-fourth ounce of soap, and one-fourth teaspoon of nicotine sulphate may be used as a spray or dip. A teaspoon of soap chips may be substituted for the soap.

The green-house white fly attacks geraniums, fuchsias, heliotropes, and pot marigolds. The same dust used for aphids may be used but it is advisable to brush up the insects soon after dusting and burn them or some may revive and fly back to the plants. The immature forms of white flies are tiny scale-like creatures that attach themselves to the under side of the leaves.

lowing a treatment with an insecticide. To allow the insecticide to remain on the plant may cause injury to the foliage.

Winter Porch Boxes

WINTER porch boxes are as good as a gleam of sunshine for brightening up the place. Here where small evergreens are so easily obtained such boxes can be achieved at little expense.

Small specimens of cedar, spruce, yew, juniper, pine, fir, arbor-vitae and hemlock furnish the upright plants which are so effective against the back ground of the house.

To get the blending trailing effect which any proper window-box must have, the trailing or climbing ever-

raw cabbage, tomatoes (canned or raw), and not less than eight glasses of water daily. Root vegetables having yellow coloring have a valuable vitamin, just as do the leafy vegetables. Instead of the usual winter diet of meat and potatoes, less of these and more of the fruits and green vegetables would be a far wiser choice.

Tested Recipes

One Dish Luncheon

- 1 pound hamburger
- 3 onions
- 6 potatoes
- 3 tablespoons butter
- salt, pepper
- 1 can tomato soup
- ¾ cup hot water

Slice the raw potatoes and onions and mix. Arrange the vegetables and meat in alternate layers in a baking dish, sprinkle each layer with salt and pepper and dot the vegetable layers with the butter. Mix the soup and water, pour over all, and bake in hot oven until tender.—L. A. C.

* * *

Children's Gingerbread

- ½ cup granulated sugar
- 2 cups of flour
- 1 teaspoon baking powder
- ½ teaspoon salt
- 1 tablespoon cinnamon
- Sift together three times and add
- 1 cup thick sour cream
- ¼ teaspoon soda (stirred in cream)
- ¼ cup milk—sweet or sour
- ¼ cup New Orleans molasses
- 2 well beaten eggs

Stir all well and bake 20 minutes in shallow buttered tins.—C. S. W.

Old Honey Passes Waffle Test

FIFTY-EIGHT years ago a hive of honey bees made some white clover honey that has been kept by the United States Department of Agriculture and tested at intervals throughout a half century or more. Once almost colorless, this honey now resembles blackstrap molasses. Its original flavor has changed until it now tastes considerably like buckwheat honey. However, this honey would not be out of place on steaming hot cakes or waffles at this time but for the fact that the department plans to age it indefinitely or until it is no longer fit for consumption, testing it from time to time to note chemical changes. All kinds of honey darken after the first few years and the flavor also changes.

This gift suggestion is an exclusive pair of old-fashioned silhouettes. A delicate aura of lace and flowers adds much softness of outline to the glossy black little figures. Paper size is 6 by 8, a beautiful vellum stock, by the way. They are No. M649, inexpensive yet charming for framing or mounting on boxes or wall panels. Black oval frames may be ordered as No. M650. These are high-grade frames of wood and composition with glass, back and hanger.

No. M650—Black oval frames\$2.25 per pair

Order from Embroidery Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, New York.

To kill them the plant must be sprayed or dipped in some solution. Soap and water with one quart of water to three-fourths ounce of soap is as satisfactory as anything. A commercial insecticide called lemon oil used at the rate of three tablespoons of lemon oil to a pint of warm water is satisfactory.

Boston ferns, fuchsia, Jerusalem cherry, or coleus may show small tufts of cotton-like material. This substance has been secreted by mealy bugs to protect their eggs and young. A strong force of water from a hose will break up the masses and kill the eggs. The lemon oil preparation also kills mealy bugs or they can be brushed off with an old tooth brush.

The red spider is neither a spider nor an insect, but a spinning mite. They thrive in the dry warm atmosphere of the living room. As with the mealy bugs they can be washed off the plant by a hose or sprayed with lemon oil.

Scale insects which attack palms, aspidistra, and rubber plant can be controlled by washing the leaves with a sponge dipped in warm soapy water. This washing also rids the leaves of dust and dirt and helps to keep the plant healthy.

One can not expect to kill every insect with the first application of a remedy no matter what the remedy may be, says Miss Griswold. Some treatments will have to be repeated several times before the pests are controlled. In general all plants should be washed with clear water the day fol-

green, euonymus radicans, is excellent. It has roots on the branches which help it to conform its growth to the receptacle in which it stands.

Head Off Winter Colds

THE bane of winter weather is colds, often one after the other, with decreased vitality and general "misery-blendness". There are many causes which may contribute to this condition, but one chief cause is eating the wrong foods.

In this climate where there is very little sunlight in winter, the curative effect of sunshine is almost missing. In Cornell University this defect is remedied for students afflicted with colds by giving them weekly ultra-violet light baths. In addition to this treatment, they are given instruction about diet and ventilation, and, if a case is very persistent, special study of the nose and throat is made, besides using a catarrhal vaccine. Last year the ultra-violet ray sun parlor was credited with a 40% reduction in the number of colds among those taking the treatment.

Most doctors have ultra-violet light machines in their offices and can give such treatments when needed. But that takes time and money, and cannot always be used when needed most. A simple, everyday matter is to balance up the diet so as to include the foods which help one to resist colds. These are: plenty of milk and butter, fresh fruits and green vegetables, including

More Answers to "How It Should Be Done"

HERE are other questions that have come in the "How It Should Be Done" series:

Should a woman thank a man for taking her to the theatre or movie?

She should express pleasure in the evening's entertainment; that is, an indirect way of thanking him.

When should one begin to teach "manners" to children?

As soon as children begin to talk, they can learn to say "thank you". When they understand anything they are told to do, is the time for them to begin little courtesies, such as picking up articles for an older person, opening the door for a lady, etc. These small things show good breeding and if not learned in youth are hard to acquire when older.

What are some of the most conspicuous marks of good breeding in older children of, say, high school age?

A high school boy or girl should have no difficulty with correct table manners, even for a very formal dinner, should automatically open doors for

difference who. What shall I do to break her of this?"

This comes from an irate parent. I am inclined to suggest that first of all she change her own attitude toward the child. There is no child who cannot get on with some one and the adults in charge must take a more constructive point of view, asking themselves not how can they break her of quarrelling with everyone, but how they can help the child to be more cooperative.

I do not know this little girl but I can guess that she is not very happy. She probably realizes that people do not like her and this makes her more antagonistic. Perhaps she has not learned to respect the rights of other children and wants always to have her own way. That is not her fault; all children want their own way, but their parents have to teach them, not by talking but by practice, that it is necessary to give in to others, to share with others, and to plan for others some of the time if you want to be accepted by them. Has this little girl been permitted to invite other children into her home and plan for them a pleasant afternoon? Has she been told beforehand what her duty as a hostess would be?

This child may have executive ability and is not getting sufficient outlet for its use. Perhaps she needs more opportunity to plan and do things for herself, to do things about the home, to take responsibility.

Perhaps she is playing with too many children at once. Some children become over-excited by a large group.

Perhaps she is ridiculed or teased at home so she "gets even" by bullying or quarrelling outside.

Perhaps she is handicapped physically and cannot do the things that her playmates can do. This would make her feel inferior and tend to develop a general antagonism toward the group.

Every child needs to be taught to excel in something so that he has a contribution to make to the group. This will help him to build self-confidence, the lack of which lies at the bottom of both over-timidness and over-aggressiveness.—Edith D. Dixon, N. J., Extension Service.

Training Children in the Use of Money

A VERY simple method of starting children in the use of their allowances is that employed by social service agencies in dealing with foreign or illiterate families. It consists of several envelopes—preferably stout manila for durability—one for each kind of expenditure. Two would be enough for a child at first, one marked "To spend" and one "To save for something nice."

Many parents give their children a few pennies each week when they are but four or five years old. When a child has learned to make change, to add or subtract small amounts, and can be sent to the store, he is old enough to have some money of his own to handle. The envelope system is a help until he can write his "accounts" in a book. Then he should be taught gradually how to find out what he has spent and what is left, how to save for definite purchases greatly desired for himself or for gifts, and ultimately how to manage larger sums which include personal money and money for definite uses such as "school," "car fare," and "lunches." A child who is old enough to ride on street cars alone is ready for a notebook system of accounts.

As the number and kind of expenses increase, the Bureau of Home Economics does not consider the envelope system satisfactory. It necessitates keeping more money on hand than is desirable. It provides no permanent classified record on which future estimates can be made. It is confusing because in order to make change money is transferred from one envelope to another.

By the time a boy or girl is in the last grammar grade or ready for high school, a clothing allowance may be

added and its use taught. This is a good time to introduce a check book. If the local bank does not handle accounts for minors, checks may be drawn on the parent up to the amount of the allowance and all transactions made as businesslike as possible. Poorly chosen purchases will occur from time to time, but after a little experience the student trained in this way can be trusted away from home to handle funds intelligently.

Burn Them Out

It often happens that the holes in the new nipples for the baby's bottle are so tiny that no milk can be drawn through. The trouble is best remedied by burning them out with a large

Tailored Chic

2924

Dress Pattern No. 2924 with its buttons down the back denotes new tailored chic for smart day wear. A monotone tweed mixture or flat crepe in plain or printed design would be well suited to this pattern. Buttons and buckle closing should match. Pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3½ yards of 39-inch material with ¾ yard of 35-inch contrasting. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with proper remittance in stamps. Add 12c for one of the new Spring fashion catalogs and address to Pattern Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, N. Y.

needle or darning needle, heated over a flame or fire. Hold the needle with pincers or pliers if necessary. Care must be taken not to get the holes too large.—E. M. N.

Start planning your flower garden now. Send for planning and planting guides. They will help you to have flowers from spring to fall.

Smartly Youthful

2901

Girl's dress pattern No. 2901 is the extremely simple type that youth demands. Inverted pleats at each side of skirt front give it fullness and flare. The buttoned bodice is novel, while the pin tucks on the shoulders give a trimming note. Pattern cuts in sizes 6, 8, 10 and 12 years. Size 8 requires 2½ yards of 39-inch material with ½ yard of 35-inch contrasting. Price, 15c.

their elders to pass through and follow through after them, should say "Yes, Mrs. Blank" instead of "Yeah" or "Uh huh", rise when older people enter the room (boys rise when girls or women enter), offer older people a seat in railway cars, avoid making any part of their toilet in public, such as trimming nails, picking teeth, combing hair (even if it is bobbed) etc. The underlying principle of thoughtfulness for others is always a safe guide.

The Scrapper

"MY little girl of 6 years scraps with everybody with whom she comes in contact—playmates, babies, older children, adults—it makes no

Save Money SPECIAL ECONOMY OFFERS GREEN'S "approved" FRUITS and FLOWERS

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David's latest escapade is the release of a crow that Perry Larson had captured by endless patience and staked out in the cornfield to keep other crows away.

David is lonely but a new friend cures this trouble. Blind Joe Glaspell, who plays the violin, arouses David's sympathy and he loans Joe his father's violin. Soon David makes another acquaintance, Miss Holbrook. He names her "The Lady of the Roses." As we left David last week, he was trying to be friendly with a gang of young hoodlums, but it looked as though there might be trouble ahead.

* * *

"Sure! We want her in the middle," grinned the boy with the tin can. "Hold on till I get her train tied to her," he finished, trying to capture the swishing, fluffy tail of the frightened little cat.

David had begun to play, but he stopped his music with a discordant stroke of the bow.

"What are you doing? What is the matter with that cat?" he demanded.

"Matter!" called a derisive voice. "Sure, nothin' 's the matter with her. She's the Queen o' the Ballet—she is!"

"What do you mean?" cried David. At that moment the string bit hard into the captured tail, and the kitten cried out with the pain. "Look out! You're hurting her," cautioned David sharply.

Only a laugh and a jeering word answered. Then the kitten, with the bag on its head and the tin can tied to its tail, was let warily to the ground, the tall boy still holding its back with both hands.

"Ready, now! Come on, play," he ordered; "then we'll set her dancing."

David's eyes flashed.

"I will not play—for that."

The boys stopped laughing suddenly. "Eh? What?" They could scarcely have been more surprised if the kitten itself had said the words.

"I say I won't play—I can't play—unless you let that cat go."

"Hoity-toity! Won't ye hear that now?" laughed a mocking voice. "And what if we say we won't let her go eh?"

"Then I'll make you," vowed David, aflame with a newborn something that seemed to have sprung full-grown into being.

"Yow!" hooted the tallest boy, removing both hands from the captive kitten.

The kitten, released, began to back frantically. The can, dangling at its heels, rattled and banged and thumped, until the frightened little creature, crazed with terror, became nothing but a whirling mass of misery. The boys, formed now into a crouching circle of delight, kept the kitten within bounds, and flouted David mercilessly.

"Ah, ha!—stop us, will ye? Why don't yet stop us?" they gibed.

For a moment David stood without movement, his eyes staring. The next instant he turned and ran. The jeers became a chorus of triumphant shouts then—but not for long. David had only hurried to the woodpile to lay down his violin. He came back then, on the run—and before the tallest boy could catch his breath he was felled by a stinging blow on the jaw.

Over by the church a small girl, red-haired and red-eyed, clambered hastily over the fence behind which for long minutes she had been crying and wringing her hands.

"He'll be killed, he'll be killed," she moaned. "And it's my fault, 'cause it's

my kitty—it's my kitty," she sobbed, straining her eyes to catch a glimpse of the kitten's protector in the squirming mass of legs and arms.

The kitten, unheeded now by the boys, was pursuing its backward whirl to destruction some distance away, and very soon the little girl discovered her. With a bound and a choking cry she reached the kitten, removed the bag and unbound the cruel string. Then, sitting on the ground, a safe distance away, she soothed the palpitating little bunch of gray fur, and watched with fearful eyes the fight.

And what a fight it was! There was no question, of course, as to its final outcome, with six against one; but meanwhile the one was giving the six the surprise of their lives in the shape of well-dealt blows and skillful twists and turns that caused their own strength and weight to react upon themselves in a most astonishing fashion. The one unmistakably was getting the worst of it, however, when the little girl, after a hurried dash to the street, brought back with her to the rescue a tall, smooth-shaven young man whom she had hailed from afar as "Jack."

Jack put a stop to things at once. With vigorous jerks and pulls he unsnarled the writhing mass, boy by boy each one of whom, upon catching sight of his face, slunk hurriedly away, as if glad to escape so lightly. There was left finally upon the ground only David alone. But when David did at last appear, the little girl burst into tears anew.

"Oh, Jack, he's killed—I know he's killed," she wailed. "And he was so nice and—and pretty. And now—look at him! Ain't he a sight?"

David was not killed, but he was—a sight. His blouse was torn, his tie was gone, and his face and hands were covered with dirt and blood. Above one eye was an ugly-looking lump, and below the other was a red bruise. Somewhat dazedly he responded to the man's helpful hand, pulled himself upright, and looked about him. He did not see the little girl behind him.

"Where's the cat?" he asked anxiously.

The unexpected happened then. With a sobbing cry the little girl flung herself upon him, cat and all.

"Here, right here!" she choked. "And it was you who saved her—my Juliette! And I'll love you, love you, love you always for it!"

"There, there, Jill," interposed the man a little hurriedly. "Suppose we first show our gratitude by seeing if we can't do something to make our young warrior here more comfortable." And he began to brush off with his handkerchief some of the accumulated dirt.

"Why can't we take him home, Jack, and clean him up 'fore other folks see him?" suggested the girl.

The boy turned quickly.

"Did you call him 'Jack'?"

"Yes."

"And he called you 'Jill'?"

"Yes."

"The real 'Jack and Jill' that 'went up the hill'?"

The man and the girl laughed; but the girl shook her head as she answered,—

"Not really—though we do go up a hill, all right, every day. But those aren't even our own names. We just call each other that for fun. Don't you ever call things—for fun?"

David's face lighted up in spite of the dirt, the lump, and the bruise.

"Oh, do you do that?" he breathed.

"Say, I just know I'd like to play to you! You'd understand!"

"Oh, yes, and he plays, too," explained the little girl, turning to the man

rapturously. "On a fiddle, you know, like you."

She had not finished her sentence before David was away, hurrying a little unsteadily across the lot for his violin. When he came back the man was looking at him with an anxious frown.

"Suppose you come home with us, boy," he said. "It isn't far—through the hill pasture, 'cross lots—and we'll look you over a bit. That lump over your eye needs attention."

"Thank you," beamed David. "I'd like to go, and I'm glad you want me!" He spoke to the man, but he looked at the little red-headed girl, who still held the gray kitten in her arms.

CHAPTER XII

ANSWERS THAT DID NOT ANSWER

"JACK and Jill," it appeared, were a brother and sister who lived in a tiny house on a hill directly across the creek from Sunnycrest. Beyond this David learned little until after bumps and bruises and dirt had been carefully attended to. He had then, too, some questions to answer concerning himself.

"And now, if you please," began the man smilingly, as he surveyed the boy with an eye that could see no further service to be rendered, "do you mind telling me who you are, and how you came to be the center of attraction for the blows and cuffs of six boys?"

"I'm David, and I wanted the cat," returned the boy simply.

"Well, that's direct and to the point, to say the least," laughed the man. "Evidently, however, you're in the habit of being that. But, David, there were six of them,—those boys,—and some of them were larger than you."

"Yes, sir."

"And they were so bad and cruel," chimed in the little girl.

The man hesitated, then questioned slowly:

"And may I ask you where you—er—learned to—fight like that?"

"I used to box with father. He said I must first be well and strong. He taught me Jiu-jitsu, too, a little; but I couldn't make it work very well—with so many."

"I should say not," adjudged the man grimly. "But you gave them a surprise or two. I'll warrant," he added, his eyes on the cause of the trouble, now curled in a little gray bunch of content on the window sill. "But I don't know yet who you are. Who is your father? Where does he live?"

David shook his head. As was always the case when his father was mentioned, his face grew wistful and his eyes dreamy.

"He doesn't live here anywhere," murmured the boy. "In the far country he is waiting for me to come to him and tell him of the beautiful world I have found, you know."

"Eh? What?" stammered the man, not knowing whether to believe his eyes, or his ears. This boy who fought like a demon and talked like a saint, and who, though battered and bruised, prattled of the "beautiful world" he had found, was most disconcerting.

"Why, Jack, don't you know?" whispered the little girl agitatedly. "He's the boy at Mr. Holly's that they took." Then, still more softly: "He's the little tramp boy. His father died in the barn."

"Oh," said the man, his face clearing, and his eyes showing a quick sympathy. "You're the boy at the Holly farmhouse, are you?"

"Yes, sir."

"And he plays the fiddle everywhere," volunteered the little girl, with ardent admiration. "If you hadn't been

shut up sick just now, you'd have heard him yourself. He plays everywhere—everywhere he goes."

"Is that so?" murmured Jack politely, shuddering a little at what he fancied would come from a violin played by a boy like the one before him. (Jack could play the violin himself a little—enough to know it some, and love it more.) "Hm-m; well, and what else do you do?"

"Nothing, except to go for walks and read."

"Nothing!—a big boy like you—and on Simeon Holly's farm?" Voice and manner showed that Jack was not unacquainted with Simeon Holly and his methods and opinions.

David laughed gleefully.

"Oh, of course, *really* I do lots of things, only I don't count those any more. 'Horas non numero nisi serenas,' you know," he quoted pleasantly, smiling into the man's astonished eyes.

"Jack, what was that—what he said?" whispered the little girl. "It sounded foreign. Is he foreign?"

"You've got me, Jill," retorted the man, with a laughing grimace. "Heaven only knows what he is—I don't. What he said was Latin; I do happen to know that. Still"—he turned to the boy ironically—"of course you know the translation of that," he said.

"Oh, yes. I count no hours but unclouded ones—and I liked that. 'Twas on a sundial, you know; and I'm going to be a sundial, and not count the hours I don't like—while I'm pulling up weeds, and hoeing potatoes, and picking up stones, and all that. Don't you see?"

For a moment the man stared dumbly. Then he threw back his head and laughed.

"Well, by George!" he muttered. "By George!" And he laughed again. Then: "And did your father teach you that, too?" he asked.

"Oh, no,—well, he taught me Latin, and so of course I could read it when I found it. But those 'special words' I got off the sundial where my Lady of the Roses lives."

"Your—Lady of the Roses! And who is she?"

"Why, don't you know? You live right in sight of her house," cried David, pointing to the towers of Sunnycrest that showed above the trees. "It's over there she lives. I know those towers now, and I look for them wherever I go. I love them. It makes me see all over again the roses—and her."

"You mean—Miss Holbrook?"

The voice was so different from the genial tones that he had heard before that David looked up in surprise.

"Yes; she said that was her name," he answered, wondering at the indefinable change that had come to the man's face.

There was a moment's pause, then the man rose to his feet.

"How's your head? Does it ache?" he asked briskly.

"Not much—some. I—I think I'll be going," replied David, a little awkwardly, reaching for his violin, and unconsciously showing by his manner the sudden chill in the atmosphere.

The little girl spoke then. She overwhelmed him again with thanks, and pointed to the contented kitten on the window sill. True, she did not tell him this time that she would love, love, love him always; but she beamed upon him gratefully, and she urged him to come soon again, and often.

David bowed himself off, with many a backward wave of the hand, and many a promise to come again. Not until he had quite reached the bottom of the hill did he remember that the man, "Jack," had said almost nothing

Just David

(Continued from Opposite Page)

at the last. As David recollected him, indeed, he had last been seen standing beside one of the veranda posts, with gloomy eyes fixed on the towers of Sunnycrest that showed red-gold above the tree-tops in the last rays of the setting sun.

It was a bad half-hour that David spent at the Holly farmhouse in explanation of his torn blouse and bruised face. Farmer Holly did not approve of fights, and he said so, very sternly indeed. Even Mrs. Holly, who was usually so kind to him, let David understand that he was in deep disgrace, though she was very tender to his wounds.

David did venture to ask her, however, before he went upstairs to bed:—

"Mrs. Holly, who are those people—Jack and Jill—that were so good to me this afternoon?"

"They are John Gurnsey and his sister, Julia; but the whole town knows them by the names they long ago gave themselves, 'Jack' and 'Jill.'"

"And do they live all alone in the little house?"

"Yes, except for the Widow Glaspell, who comes in several times a week, I believe, to cook and wash and sweep. They aren't very happy, I'm afraid, David, and I'm glad you could rescue the little girl's kitten for her—but you mustn't fight. No good can come of fighting!"

"I got the cat—by fighting."

"Yes, yes, I know; but—" She did not finish her sentence, and David was only waiting for a pause to ask another question.

"Why aren't they happy, Mrs. Holly?"

"Tut, tut, David, it's a long story, and you wouldn't understand it if I told it. It's only that they're all alone in the world, and Jack Gurnsey isn't well. He must be thirty years old now. He had bright hopes not so long ago studying law, or something of the sort, in the city. Then his father died, and his mother, and he lost his health. Something ails his lungs, and the doctors sent him here to be out of doors. He even sleeps out of doors, they say. Anyway, he's here, and he's making a home for his sister; but, of course, with his hopes and ambitions—But there, David, you don't understand, of course!"

(Continued Next Week)

HANDY ANDY Says "Here's How"

To Insulate Milk House Walls

By Ray Inman

to insulate milk house walls, you can:

use dry sawdust if moisture is not liable to reach it.

line inside of walls with heavy half ply roofing to protect it.

where there is danger of moisture getting in use mill shavings in place of sawdust.

Little Recipes for Little Cooks

by *Betty*

Lesson Number 24

Dear Little Cooks:

This lesson makes two whole years of little recipes. How many of you have tried every recipe? Good for you, if you have! That makes quite a lot of good things to eat that you know how to make, doesn't it? Maybe you would like to plan a little party for your friends and get the lunch ready all yourself (or almost.)

First, you will want to decide on a day and who you want to invite. Then invite your friends by calling them on the telephone or sending pretty written invitations.

A lot of lively games always make a party more fun, so think up some everyone will like to play.

Of course, the lunch is an awfully important part of all children's parties (I guess it is of grown-up ones, too!) so we mustn't forget to get that ready.

You really know how to make everything you need for a nice party lunch; sandwiches, cocoa, salad, cookies, cake, candy, etc., because we have had recipes for them all.

But maybe I can think of a few ways to help make it a little more fancy and party-like. Here are a few things I like for my parties and I hope you will try them at your party.

Have a jolly time,
BETTY.

P. S.—I almost forgot to tell you that in some places the little cooks have a club and some of these clubs want some party recipes for the little cooks' party they say they are going to have when they finish the 24 lessons.

Maybe you could have a party for little cooks and each one bring something for the lunch.

Animal Sandwiches

First I bake a nice loaf of brown bread. I like to bake it in a pound baking powder can so as to have nice, round slices for my sandwiches. I cut thin slices and spread them with soft butter and then with sandwich filling, like cheese spread. Finely chopped walnuts mixed with salad dressing are fine, too. When I have a sandwich made, I take one of the fancy animal cookie cutters that I have and I cut out an animal from the top slice of my brown sandwich. I cut carefully so as not to cut the lower slice at all. I used a lion cutter so there is a lion-shaped hole in the top of my brown sandwich. I put the brown sandwich to one side and made a nice white sandwich from some white bread. Then I cut a lion from the top of the white sandwich.

Now comes the fun! I put the little brown lion I had cut into the hole in the top of the white sandwich and the white lion into the hole in the brown sandwich.

I made a lot of sandwiches using different cutters till I had a big platter of sandwiches that looked like a zoo or a circus—rabbits, ducks, horses, chicks, etc.

Heart-shaped cutters can be used this way to make fancy sandwiches for Valentine's Day.

Chicken and Noodles

Here is a good recipe for a hot dish. Mother will be using it for her parties, too.

1 cup small, flat noodles, uncooked.	1 cup canned peas, drained.
1½ cups cold, cooked chicken, cut fine.	1 cup thin white sauce, or 1 cup chicken gravy.
2 tablespoons pimento, chopped fine.	

For 1 Cup White Sauce

1 tablespoon flour.	1 cup milk.
1 tablespoon butter.	Salt and pepper.

I cook the noodles in plenty of boiling, salted water till they are tender. Drain the noodles when done. Butter a baking dish. I put in a

layer of noodles and then a layer of chicken, pimento, and peas. Then I add a layer of noodles and then another of chicken, peas, and pimento.

For White Sauce: I melt the butter in a saucepan and add the flour. When butter and flour are well mixed, I add milk and stir and cook slowly till the white sauce is smooth.

Then I pour the white sauce or gravy over the top, and I sprinkle fine, buttered bread crumbs or crushed cornflakes over it all and bake one hour in a hot oven.

I like tuna fish instead of chicken, sometimes.

Funny Faces

Here is a new candy you are sure to want for the party. If there are only two or three invited, you could save making them for part of the party fun. But if there are many guests, mother will know that it might make too sticky a kitchen. Anyhow it is best to practice this recipe before you have company try it.

1 cup sugar.	½ cup water.
1/3 cup corn syrup.	½ teaspoon flavoring.

Take a saucepan and put into it the sugar, syrup, and water. Stir these together and put the pan on the stove. Cook without stirring until it is very thick. Drop a spoonful into a glass of very cold water. It will form a hard, brittle mass that will crack in your fingers if it is done.

While it cooks, get out the muffin tins and butter about eight of them well. If grains or crystals form around the sides of the pan, do not stir them down. If you cared to, you could wipe them off carefully with a damp cloth wound around the tines of a fork.

When the candy is done add flavoring, stir gently and just enough to mix in the flavoring. Pour hot candy into the muffin tins, putting just a thin layer in each. The candy should be about one-quarter inch thick.

While the hot candy cools, I make my "funny faces." I give them eyes and noses and mouths by pressing in raisins, bits of nuts, tiny slivers of gum drops, candied cherries, etc., to make different looking faces.

At our house even the grown-ups like to try making funny faces. Some look cross and some

Wouldn't it be Nice
to Have a Party for
Your Friends, Now?
Here's How to Get
the Lunch Ready
All by Yourself.

have grins and some look silly. It all depends on how you stick in the raisins or nuts.

O, I almost forgot to tell you that cocoanut makes lovely hair on "funny faces!"

When the features are all stuck on and the candy is getting a little hard, it is time to loosen it around the edge. Take the faces out before they are real hard and have some fun shaping them into long faces, broad faces, pulling out big ears or a top knot or a long chin. A toothpick or a sucker stick can be stuck in on one side before the candy is hard and give a nice handle to hold the candy with. Place the "funny faces" on oiled paper to harden.

Peppermint, wintergreen, clove and cinnamon make good flavoring for these if you like something different from the usual vanilla or lemon.

A little coloring can be added to the syrup and sugar, too.

Fancy Cakes

So many little cooks have written asking me to tell them ways of fixing up cakes for birthdays and other special times and I couldn't answer their letters, but now I am going to tell you all how I do it.

I think gum drops make just the easiest and prettiest kind of cake decoration for little cooks to use. Get nice, soft, bright colored ones and make flowers of them for your cake. With scissors I snip off a thin dot of yellow gum drop for the center of a little flower. Next I cut five slim pieces for petals of the flower. I arrange the petals around the yellow center and then all I need is a long green stem and a leaf or two.

Most any good cake recipe can be used and the "Seven Minute Frosting" can be spread on the cake. Yellow flowers and green leaves around the outside of a birthday cake and yellow birthday candles in the center make a beautiful cake. Pink flowers, green leaves and pink candles are just as pretty.

For a party of children, it is nice to bake little cakes and frost each one. Put a little flower on the top of each one. Here's a secret, even grown-up folks like these pretty cakes at parties!

My! This page is nearly full and I haven't told you all I meant to. But all you little cooks know how to make cocoa for a good drink, and some fine cookies, too, if you think you need them. Fruit jello is always good, so I am sure you'll have a

wonderful lunch. Dear "Little Cooks," I wish I could come to all your parties. You would invite me, wouldn't you? You have been so good to me these two years that I just know you would. Have lots of fun at the party.

Love,

Betty

See Land Before You Buy

WHY will people invest in real estate which they have never seen? In our opinion, the farmer who does this should have little sympathy because he should know from better experience that there is no sure road to getting rich in farming. The latest swindle which has come to our attention is a development known as Romola Incorporated, a scheme in California and Arizona to sell acre tracts planted with grapefruit, to investors at \$1750 an acre. As we understand it, the company agrees to care for these tracts for a period of three years and after that to operate them on a profit sharing basis. We understand this development is likely to lose in the neighborhood of \$10,000,000 or rather the investors will lose it, and that numerous promoters and individuals connected with this scheme have been indicted and the project termed a swindle.

Other similar developments have come to our attention. Not all of them have busted yet but judging from what has happened in the past we think the chances for a bust are exceedingly good. We hope none of your hard-earned dollars are included in the \$10,000,000 which investors are losing in the Romola deal.

Before You Patent Your Invention

IT should be kept in mind that probably 99 out of a hundred patents do not return to the inventor what it costs him to invent and patent his device and then market his patent. It will cost from \$100 up to take out a patent, depending on how much search must be made in the Patent Office records to see whether the idea has already

been covered by some existing patent; and it is usually questionable whether this and other expenses in marketing it would be repaid by what one can get out of it.

In case one decides to take out a patent, he should by all means secure the services of an honest and experienced patent attorney. A patent can be secured on practically any device, no matter how much it infringes on other patents, if the claims are general and loosely enough drawn, but such a patent would be of absolutely no commercial value, as any one interested could simply get around the loose claims. The value of any patent lies in how carefully the claims and specifications are drawn and how fully they cover all the vital points, and only an able and experienced patent attorney can draw these claims in such a way that the patent will be proof against subsequent claims. One can find good patent attorneys advertising in our columns.—I. W. D.

Collecting At Long Range

I have been getting dunning letters from the United States Credit Bureau of Los Angeles, California, claiming that I owe a bill which to the best of my knowledge, I do not owe. What should I do about this?

If you do not owe this bill, by all means do not pay any attention to the letters you get. If you do owe it, why not pay it direct to your creditor rather than through a collection agency.

Our reason for making this suggestion is that apparently some collection agencies are making contracts with commercial firms to collect their bills in a manner which does not prove very satisfactory to the firm. We understand that the Los Angeles Better Business

Bureau has received quite a number of complaints against this company, which have generally risen out of the difficulty on the part of the man who gave them the account in getting any settlement or accounting from them. In many cases, at least, the contract which the collection agencies make with commercial firms is very favorable to the collection agency but not so favorable for the firm they are supposed to be working for.

Does Not Answer Letters

I have a claim against J. Sussman of 2 Thomas St., Rochester, New York, to the amount of \$45.00 for broilers which I sold him. He promised to settle but has not done so yet.

WE have written two letters to Mr. Sussman which have not been returned to us, indicating that they were received by him. So far, however, we have had absolutely no reply to our letters. When this happens, we are forced to conclude that the claim is a just one but that Mr. Sussman has no intention of settling. We have also been informed that Mr. Sussman does not have an office in Rochester. We are giving these facts for the guidance of our subscribers.

Avoid Sending Cash Through the Mail

There is always some danger that money will be lost when it is sent through the mail. This is particularly true of coins. May we, therefore suggest that when you have occasion to send money to American Agriculturist, either for subscriptions, patterns, embroidery, trespassing notices, or insurance policies that you send either a check or postal money order. Where amounts are very small, stamps will be acceptable.

Uncle Sam Mail Box Support Not Approved

A NUMBER of readers have inquired for plans for constructing Uncle Sam mail box support. The Post Office Department at Washington has recently made a ruling forbidding the use of ugly and grotesque mail box supports and it is our understanding that this disapproval covers the Uncle Sam type, as well as concrete pigs, dogs, and other grotesque effects.—I. W. D.

Fastest, Cheapest Way to Clear Land

At a contest held recently in England, Hercules all-steel triple power stump puller pulled stumps faster than any other method. Quick work—low cost and one man does the job. Hand power in four speeds, single, double, triple and quadruple power. Easy to pull—quick winding cable, and other features. Horse Power Hercules is most complete, up-to-the-minute stump pulling outfit made. Write for prices and catalog—get our New introductory offer.

Comes complete ready to use

ONE-MAN SAW MILL—39

Makes lumber, shingles, cross ties, fence posts, laths, fruit and vegetable crates and boxes, dimension blanks for furniture, etc. Splits blocks into firewood. Needed by farmers, timber owners, contractors. Pays for itself in a week, or on one job. Guaranteed. Sold direct from factory. Write today for Special Offer and Free Book "How To Make Lumber." BELSAW MACHINERY CO. 708 Mfg. Ex. Bldg. Kansas City, Mo.

Post Your Farm And Keep Trespassers Off

We have had some new signs made up of extra heavy material because severe storms will tear and otherwise make useless a lighter constructed material. We unreservedly advise farmers to post their land and the notices we have prepared comply in all respects with the laws of New York, New Jersey and Pennsylvania. The price to subscribers is \$1.00 a dozen; \$3.50 per fifty; \$6.50 per hundred; \$60 per thousand.

Check or Money Order must accompany order.

American Agriculturist

When writing advertisers be sure to say: "I saw it in American Agriculturist."

Meeting Agriculture's Intermediate Credit Needs A FULL BILLION DOLLARS—

have been loaned by the twelve Federal Intermediate Credit Banks in the last seven years to finance production and marketing of farm crops.

These funds were loaned—

1. Directly to more than 90 Farmers' Cooperative Marketing Associations on warehouse receipts so that they might carry out their programs of orderly marketing.
2. To more than 600 local institutions—Banks, Agricultural Credit Corporations and Livestock Loan Companies—which took farmers' notes given for agricultural purposes and discounted them with the Federal Intermediate Credit Banks.

These banks thus have made available "Intermediate" credit at low rates of interest with a maturity between commercial loans and long-term mortgage loans.

Write for free booklet to the nearest Intermediate Credit Bank listed below.

250 PRIZES for "Way-Back" Memories

Here's your chance to win two pairs of Ball-Band rubber footwear—your own selection. 200 pairs will be given for the best letters of early experiences with Ball-Band. 50 additional pairs will be given for the best photographs taken on the farm twenty or more years ago. Search your memory—and the family album—for a prize winning letter and picture. This offer expires Mar. 31, 1931. Tear off the Red Ball trade-mark below and send it in with your letter. All pictures returned if requested.

Can you recall when you *first* gave Ball-Band Footwear a trial?

THIRTY years ago, the Red Ball trade-mark on a pair of boots was "new". But it was not long a stranger on the farm . . . For today more than ten million of you buy Ball-Band footwear from over 70,000 dealers in this country!

Can you remember the early days when you gave these "new" boots a try? Did you learn that the Red Ball trade-mark stands for *more days wear* and *built-to-the-foot comfort* from your father—or for yourself?

We like to hear from our old friends.

Write us a prize-winning letter of your "way-back" memories of Ball-Band. Look through the family album and search among "odds and ends" in the attic for snap-shots taken twenty or more years ago. Special prizes will be given for the most interesting pictures of the early days.

Year after year our skilled craftsmen have met your footwear needs with better quality at always reasonable prices. Today, the Red Ball trade-mark brings you that *natural*, light-on-the-foot feeling you want in modern footwear. Yet the live, tough rubber in Ball-Band foot-

wear will wear longer than it's reasonable to expect.

We prepare rubber for but one purpose—the making of quality footwear. And we've developed many special compounds—for the heel, for the sole, for the toe and so on. The stout linings and fabrics you see in Ball-Band are knit in our own factory. Each part, rubber or fabric, is perfected for the particular job it must do; each adds to that *plus* wear you have learned to expect of Ball-Band.

Your entire family's needs are cared for by our full line of over 800 items, including Mishko-sole leather work shoes. There's a Ball-Band dealer near you. If you do not know his name, write us. And remember to look for the Red Ball trade-mark.

MISHAWAKA RUBBER &
WOOLEN MFG. CO.

482 Water St., Mishawaka, Indiana

Choose the boots that fit your needs—short boots, hip boots, red boots, white boots, sport boots or the 3-Buckle Walton giving "boot protection with shoe comfort."

The Ball-Band Double White Sole Sanslip is especially popular because the extra heavy vamp and double white sole give a double share of *more days wear*.

Treat 'Em Rough

—for Ball-Band Arctics are built to welcome punishment. Reinforced at every point with live, tough rubber, these Arctics will give you the long wear you have a right to expect of Ball-Band. There are snug fitting cloth Arctics for cold and snow, and all-rubber styles for mud and wet.

New Day Styles— Old Time Quality

Styled-to-the-shoe by our Style Committee, our Savoy all-rubber galoshes combine lightest weight and newest style with complete protection.

SHRINES OF AMERICA

Lexington and Concord

AS THE British troops marched inland from Boston, the colonists, roused by Paul Revere, snatching what weapons they had, pitchfork or flintlock, hastened to arranged mobilizing points. Such a group had gathered on the green at Lexington (below) when the Redcoats arrived. The organized fire of the soldiers dispersed the disorganized Patriots. When the British reached Concord Bridge (upper right), however, they found the colonists reassembled, better organized and ready to fight. A poet, describing it, says of the skirmish: "By the rude bridge that arched the flood, Their flag to April's breeze unfurled, Here the embattled Farmers stood And fired the shot heard 'round the world." The British were driven into a harrassed retreat which lasted all the way back along the road to Boston. The statue above, representing a minute man leaving his plow to fight, stands at the head of Concord Bridge.

Don't Invest a Dollar in Building, Remodeling or Equipping Until You See These Two Books!

WHATEVER you may be planning to do—whether it be a modest few dollars for equipment or ventilating, or thousands of dollars for new buildings or complete remodeling—don't lay out a single dollar, don't decide on a single step until you get the new Star Line Book.

Learn from Starline's engineers the foremost ideas that have been developed to save time and money in farm buildings. Scores of patented, exclusive inventions, pictured and described in this book, are ready to go into any barn, to cut costs and increase income.

A new stall feature, for instance, developed to eliminate the cost of replacement—to prevent costly, unnecessary duplications of equipment, and a new litter carrier actually cuts the time and labor of cleaning the barn in half. This book tells you how—it's just one of hundreds of items!

Stanchions—stalls—drinking cups—litter carriers that cut your labor costs to the bone, increase your herd's production and produce maximum efficiency and earnings in your dairy barn. Equipment that keeps cows safe—clean—comfortable; that pre-

vents trampled udders and similar expensive accidents; that stops dirt and dampness from breeding infections and diseases, which cut down milk production and eat up your profits!

New, tested, proven ideas in ventilation that keep cows healthier, more comfortable and more profitable.

Poultry equipment that reduces feed waste and poultry-keeping losses to the very minimum!

The result of forty-eight years of experience in developing and producing the finest equipment in the world for barn, hog and poultry house is laid out before you in the new Star Line Book.

Hundreds of pages and actual photographic reproductions, showing how Starline serves and saves in every department of your farm layout. Simply check the coupon at the right and mail it.

What the New Year Promises

One of the Finest Messages to Farmers Ever Written

EDITOR'S NOTE:—The following address was broadcast over General Electric Station WGY recently, by Jared Van Wagenen, Jr., contributing editor of *American Agriculturist*. Our readers will agree that Mr. Van Wagenen has written many fine articles for this publication, but never anything better than this.

By JARED VAN WAGENEN, JR.

runs that the streets of Athens were silent and deserted when it was known that Demosthenes was speaking in the Assembly of the people.

January Named from Janus

But even so, I am sure that these forgotten poets and dreamers never hit upon a more meaningful fancy that when they named the month January for the two-faced God, Janus. They pictured him as a man with two faces turned in opposite directions—one of the faces a weary, sad old man, gazing regretfully back into the irrevocable past and the other the face of an eager youth looking forward and seeing visions in the future.

So thought the ancients concerning New Years twenty centuries ago and I take it that we moderns can hardly come to this momentous date without at least a glance into the receding past and an inquiring look into the future.

Now I am neither a prophet nor yet the son of a prophet but I have undertaken to survey the coming year and to see if I cannot predict at least a few things which is holds for farmer folk.

Business Cycles Come and Go

But first, of all, let me say with perfect distinctness that I make no pretense to foretell the happenings of 1931 as to the price of milk or the other things we have to sell—nor do I try to speak of economic events. There is no other one topic in all the world concerning which men inquire so eagerly, and literally millions of words have been written and spoken in the effort to answer their questionings, but I observe that not even the Wise Ones, the big imposing national figures in the field of economics and finance—

come to even approximate agreement as to the immediate future. Out of all this mass of questioning and theorizing, about all we can agree on is this—that there seems to be a sort of definite up and down swing of prices and industrial activity which we call the business cycle and that not all our boasted knowledge and resources seem to be able to do away with these recurrent periods of falling prices, unemployment, and social distress. Apparently, about all these economically wise men can say is this: that out of these depressions in the past, we have always emerged into a renewed and vigorous industrial prosperity, but for this greatly desired consummation, few men are willing to set a definite date. So I do not propose to add to the flood of language already written by venturing to explain the cause of our depression or any prophecy as to when the pendulum will be definitely on the up swing.

But there is one thing which I think I may rather explicitly promise farm folk and that is this: that whatever else may happen, the ancient assurance of seed time and harvest will not fail. I believe it to be one of the outstanding features of the north-eastern United States—the region of which New York State may be regarded as the heart, that we seem to be almost immune from what may be regarded as serious, wide spread agricultural disaster.

In our long agricultural annals, perhaps the direst year was 1817 when the tradition runs that there was frost every month in the year and when in all New England there was literally no corn. In popular phrasology it was long remembered as the year "eighteen hundred and froze to death". Men asked in genuine anxiety if it were possible that the very courses of nature had

(Continued on Page 24)

Jared Van Wagenen, Jr.

IT sometimes seems to me that we of this wonderful twentieth century stand in danger of falling into a smug complacency by which we assume that our particular generation is made up of the only really wonderful people that ever lived and that we are making the only worth-while contribution to the history of the centuries. Now measured in terms of mechanics and of men's conquest over nature this may be so. We do know more about spark plugs, and heterodynes and bacteria and chemistry than all the by-gone ages ever conceived of. Doubtless we are the only people that ever rode the air or spoke across a thousand miles of empty space as I do now, but may I remind you that two thousand years ago in Greece, and in a lesser degree in Rome, there were men who painted wonderful pictures and carved glorious statues and architects who piled stone on stone into noble buildings and orators and poets who knew the riches and the magic of the spoken word to a degree that all the centuries since have never been able to add to. It is at least a debatable question if the scholarly Mr. Einstein can out-think Socrates and when it comes to weaving words—the story

My Experience With Turkeys in 1930

The Books Show a Profit in Spite of Low Prices

By MRS. MINNIE L. GORDON

THE article I wrote last spring for *American Agriculturist* on turkeys brought such a flood of letters from readers that I thought they would appreciate another from me in which I will try to answer all their questions and tell about a few things I learned the past season. I am still using the same method I have for years. I do not raise by the mash method as for me, there is little or no profit connected with it. I have the bronze breed and never keep over seven hens and one tom. From these birds this year I sold 117 turkeys which averages nearly seventeen turkeys to each bird. Although I sold mine at Thanksgiving at a lower price per pound than I have for twenty years, I made a net profit of \$125.00. If I had kept them for the Christmas market I would have received ten cents more per pound, which would have amounted to over \$100 more, as I had over a thousand pounds.

The ones who raised by the mash method tell me they lost money this year. I feel that, although prices are very low, the small farmer's wife who can raise them should do so, as I find I can make more profit from this business than anything I ever tried. Prices are sure to go up some time. Everything on the farm has taken a big drop, turkeys along with the rest. I love to raise turkeys which is one reason for success in any undertaking. I have received scores of letters telling the same story of failure that I had to tell several years ago before I began this method of raising them. For example, one letter says! "I have

lost all my flock but a few of my poults." This usually means three-quarters of the flock. What is the cause?" One big factor in this interesting business is strict sanitation. This keeps them healthy and eliminates all disease. I dust my turkey hens and chicken hens in March with sodium fluoride and I never have lice—a pest that will kill all poults.

Gather the eggs and turn them each day. Keep in a moderate temperature. Handle very carefully and incubate them before they are two weeks old. I incubate the eggs under chicken hens and put not over eight eggs under each hen.

One week before they are due to hatch (which is twenty-eight days) thoroughly wet the eggs with warm water (about one cupful to each nest)—then again when they are pipped. This makes them hatch forty-eight hours before time.

There are few problems in turkey raising so important as rearing and feeding the poults, because the greatest losses in turkey raising occur in about the first eight weeks after the poults are hatched. The importance of keeping the poults on clean ground and entirely away from chickens cannot be over-emphasized. They must be kept warm and dry and fed properly. Otherwise the digestive system will be affected and disease gain control. I leave the poults under the chicken

hen twenty-four hours after hatching, then slip them under the turkey hen. (I allow the turkey hen to sit a few days before eggs are due to hatch) and she will usually own them. I place twenty or twenty-five poults with her in her house and enclose the house in a yard made of wire fencing. Keep them in this enclosure for ten days or longer. Of course, the poults can run where they please. This teaches the turkey hen where she is to come nights and also keeps her from running the poults through the wet grass.

Do not feed until they are forty-eight to sixty hours old. For their first feed give clabbered milk, and sand, and charcoal mixed. The next day begin on their regular schedule. Feed 3 times a day until 2 weeks old then feed twice a day. When one month

One way not to do it. Turkeys that run with hens are subject to disease. Perhaps that is why there are so few turkeys in the picture!

Vol. 127 January 17, 1931 No. 3

Thought for the Week

WILLIAM Henry Harrison, the famous "log cabin" candidate for President once said, during the campaign of 1840:

"In all ages, and in all countries, it has been observed that the cultivators of the soil are those who are least willing to part with their rights, and submit themselves to the will of a master."

The Dairy Situation

"Prices for butter lowest in twenty years."

THE above quotation from a newspaper is a discouraging headline to read, but not quite so bad as it sounds, nor so bad as it would have been twenty years ago. A quarter of a century, or even less time ago, with butter prices as low as they are now, dairymen would be selling dollar milk or less. In fact, such low prices for fluid milk did prevail, for milk prices always depended directly upon the price of butter fat. Now, however, thanks mainly to organization, fluid milk prices have been very fair all through 1930, and even now, with recent reductions, prices of milk are far above equivalent butter fat prices.

The price fluid milk will bring during 1931 depends almost entirely upon the dairymen themselves and their ability to cooperate. The purposes of an organization are not all those of strictly marketing. The biggest profits which fruit growers of the Pacific Coast have realized have come from organized practices by the growers, such as spraying, grading, packing, and regulating the supply before the fruit was even shipped.

Along this same line, one of the most hopeful factors in the dairy situation is that dairymen are responding much more readily than they did even five years ago to suggestions which affect the efficiency of the business. When they were asked to increase production for any short period and fully understood that it was necessary, more of them responded than ever before. Vice versa, they will now cooperate to reduce the surplus.

Whether or not we actually have dollar milk in 1931 will depend upon the number of dairymen who will cut down the surplus, and it is not necessary, either, for a farmer to be a member of an organization to do his part. All will benefit by the result. There is no question whatever that consumption will continue to be less, at least,

during 1931. Unless some means can be found, therefore, to fit the production to this decreased consumption, the surplus will continue to wreck the market.

In recommending to dairymen that production be cut down, we are by no means suggesting that good cows should be eliminated, or that such good cows should not have good feed and care. But there never was a time, in the last quarter century, anyway, when there was greater need for every dairy farmer to get rid of his poor cows. There never was a time either when there was more need of dairymen using more milk at home—more of it in the cooking, more of it on the table. Why not consider bringing back the art of butter making? Keep a few quarts out each day and make your own butter. It is a radical thing to say, but we are sure we are right in the statement that the dairy farmer would be actually better off, if he could not use the milk otherwise, to pour a few quarts in the ditch every day.

The reward for any thing that you dairymen can do along these suggestions will certainly be reaped with better prices for milk—something certainly worth aiming for. And it is no longer an excuse to say that there is no use of your making sacrifices because the other fellow won't do it. That might have been true once, but, as suggested above, enough of the "other fellow" will now cooperate to make the effort well worth while.

Dr. Ladd Appointed Deputy Conservation Commissioner

THE thousands of friends of Dr. C. E. Ladd, Extension Director of the New York State College of Agriculture, will be interested in the announcement on our News Page that Dr. Ladd has taken leave of absence from the College to accept an appointment as Deputy Conservation Commissioner under Commissioner Henry Morgenthau, Jr. If Mr. Morgenthau had searched the State over, he could have found no man better fitted for this important position than Dr. Ladd. Both Mr. Morgenthau and Dr. Ladd have a thorough understanding of and sympathy with farm and conservation problems, and these problems are closely related.

The leadership of these two men should make certain a better understanding between farmers and sportsmen, and more than this, should go far toward establishing right and fundamental policies in reforestation, soil surveys, and land utilization.

Says Oleo Is Better Than Poor Butter

I am glad to see "Personal Experience of a Consumer" on your Editorial Page as I have had the same experience. It is impossible to get good butter at the stores around here. The oleo has a much better taste than dairy butter we have to use. How can dairymen blame people for eating oleo when it tastes better?—A.H.

THERE is no question that if the quality of butter were improved, it would have a tremendous effect in increasing the amount of butter used, but of course, if one can possibly get good or even fair butter, they should not think of eating oleo. This is particularly true of farmers. Not only is oleo not as good food as butter from a health standpoint, but all farmers, whether dairymen or not, should have loyalty enough to patronize their own business.

We were much pleased at the emphatic position the National Grange took at its recent meeting at Rochester on this question of farmers eating oleo. It called on its membership with the following resolution: "That our members use no substitutes for butter on their tables. It is setting an example to others that may result in improved dairy conditions, and through the increased use of grain and feed, benefit all agriculture."

The oleo problem is all the more important, now, because the United States Commission of Internal Revenues has ruled to permit the use of unbalanced palm oil in the manufacture of oleo, without subjecting the finished product to the usual tax of ten cents per pound. The first month

that this new ruling was in operation, butter prices declined from thirty-seven and one-half cents to twenty-nine cents.

We repeat: one answer to this oleo problem is for farm people to consume more butter themselves. If you cannot get it any other way, make the butter at home; get a small separator and churn and help take the surplus off the market as well as give your family a real food treat.

A Successful Man

I have been more successful at making happiness than I have been in making money.—A.C.W.

WE bring attention to this statement from a letter because it seems to us that in this single sentence this man has said a whole volume on the philosophy of happiness.

How many of us strive all the time to find the pot of gold at the rainbow's end, and after sacrificing our whole lives and friendship and love, and all those other factors that really mean something, how often do we find that the pot of gold was nothing but trash and that we had sold our birthright for a mess of potage.

To Celebrate One-Hundredth Anniversary

A RECENT meeting of the Governor's Agricultural Advisory Commission recommended a very small legislative appropriation to be given to the New York State Agricultural Society for the purpose of celebrating its one-hundredth anniversary.

This Society is the oldest farm organization now existing in the United States. It numbers among its former members and officers many of the great leaders in New York State affairs. Not only was it active in laying the foundations of good agricultural practice in this State, but it helped to organize many of the other organizations; the Society started the New York State Fair.

In recent years, the New York State Agricultural Society has been active in preserving for the present and for posterity the practices and farm and home equipment of farmers of other days. It was instrumental in securing appropriations for building the Farm Museum at the State Fair which contains exhibits of interest to thousands every Fair time.

It is, therefore, fitting that this Society should celebrate its one-hundredth anniversary, not only to emphasize its own honorable history, but more especially to bring to attention again the splendid achievements of those early farmers of this commonwealth who farmed and lived well.

Eastman's Chestnut

ONE of the most helpful and inspiring experiences of my life has come through visiting hundreds of farmers in the last two or three years who have been nominated for the honor of Master Farmer. It is surprising how many of these men who have made a success of both their farms and their lives started their business lives with practically nothing in the way of material possessions. I remember asking one of these nominees what he started out with when he began farming, and with a smile, he said, "All I had was a young wife and an old red cow!" Which calls to my mind the old story of the young mountain lover who walked four miles over the hills to call on his lady fair.

For a time they sat on the sofa in the parlor, but soon the spell of the evening had its effect and Hiram sidled closer to her and patted her hand.

"Mary," he began, "you know I got a clearin' over thar an' a team an' wagon an' some hawks an' caows, an' I calc'late on building a house this fall, an'"—just then he was interrupted by Mary's mother in the kitchen.

"Mary," she called in a loud voice, "is that young man thar yit?" Back came the answer.

"No, ma, but he's gittin' thar!"

With Our A.A. Boys and Girls

RIGHT now, in this land of ours, live thousands of boys and girls who will become successful men and women. Probably every one of you who reads this page knows intimately some young fellow whose fame in years to come will be known throughout this country and throughout the world. In years to come you will say, "Why, I knew him well when we were boys together."

Some of you will be famous, yourselves, some day. To us who are older, there are few things more satisfying than to help some boy or girl along the pathway to success. Ambition is the main-spring and at times it takes only a word of encouragement or faith to start some young fellow going. Perhaps you would like to read a little pamphlet that is chuck full of inspiration and suggestions. The International Harvester Company has published it. They call it "Young Folks, Do something and Be Somebody." If you would like a copy of it, drop us a line and tell us so.

An A.A. Girl from Maryland

IREAD in your paper that you would like all boys and girls who own a pony to send in a picture of it. I am enclosing a picture of my Shetland pony, Sunny Jim. He is a great pet and is only four years old.

I ride him, drive him and have taught him to lie down. He loves sugar and is often heard at the side porch nicker for it.

I also have three pet Chesapeake

water dogs. One is just a small puppy and we call him "Amos". He is up and ready every time the auto starts so he can take a ride with us.

I hope to see more pictures of boys and girls with their pets on the Boys' and Girls' page of the American Agriculturist.

—MARGARET P. HENDRICKSON.
Maryland.

From Betty Cooks

IENJOY your cook book so much, I pretty nearly every day make something out of it. I am enjoying the last lesson a lot; I am making the pickle recipe and it is great fun. You see I am a cook now because my mother is away and I have to cook for my father and my brothers. I have also made the devil's food cake and sponge cake. I am canning a lot of pickles this year.

It must be lots of fun getting a lot of letters every day and having them in your name too. Tonight I heard a cat meow so I went outdoors to see where it was and across the street was a little tiger cat; someone had dropped it out of a car so I picked it up and brought it in. I thought of you when I picked it up because you are kind to animals. I have also caught up my twelve lessons since my mother has been away. So she will send in for my pin, I think, when she gets home. Our twenty-four lessons will soon be out, won't they? Will you have more next year? And if you ever write to some of your little cooks, write and tell me how old you are and when your birthday is, because maybe it is on mine. Mine is August 3rd.

Your friend,

EVA WINSHIP, New York.

* * *

ILIKE your recipes in the American Agriculturist very much. I have gotten so I can make fudge all alone. Once I made some cocoa without a bit of help, and I canned two pints of raspberry this year, besides making a short cake. Once I made some Hallowe'en cakes. Most everything else I had some help about, but it was fun. Once last year I made a cranberry relish, twice I made some popcorn balls, once I made a baked apple. I made a Mother's Day cake and an apricot whip once. I like to cook and every time mamma cooks I tease to. I am nine years old. My birthday is in June. I have two brothers, David who is seven years; his birthday is in October. Donald was four on the ninth of August. I like your recipes and am using them often. With love, DORIS SINGLETON, Vermont.

be held in place by winding a rubber band above piece 1; place a small washer under piece c and wind a rubber band below as indicated; the washer will prevent the rubber from sticking to piece c and allow the arms to move freely. The other piece 1 should be fastened at g of piece b and be fitted with a pin or tracing point the same size as the pencil and held the same way. This pin should be pointed and the point protected by a small brad driven in and the point rounded so it will slip over the picture without scratching.

Make a shouldered pin p with a shank which will fit the 5/16" holes e of pieces a and b. In the bottom of this drive a round headed brass upholsterer's tack which will slip easily over the

Robert Child of Malone, New York, and one of the calves he raised as a 4-H Club member.

paper as the pantagraph moves. Fit a 3/16" stove bolt with thumb nut and washer at n. Wax the arms at the angles with a wax candle so they will slide easily; fasten a 1" No. 12 round head screw at k, fasten k to the edge of the table or drawing board and the pantagraph is ready for use.

Place the pencil point at h as shown, and the tracing point at g; trace the lines of the picture carefully and the pencil will make a reduced drawing. Change the pencil to point g and the tracing point to h, place the picture at h and the pencil point will make an enlarged drawing. If the pencil does not bear hard enough to make a visible line two or three iron nuts or washers may be hung over its upper end.

By changing the thumb screws n in to corresponding holes in parallel arms

Who Likes to Get Letters

HOW many of our A. A. boys and girls would like to receive letters from other readers of this paper? Of course, if you expect to get letters you must be ready to write them too. Why not write first to the boys' and girls' editor of American Agriculturist, telling how old you are and some of the things you are most interested in? If you collect stamps, for example, others who collect stamps too, will want to write you; if you are an athlete you, of course, will enjoy writing to others who play on their school athletic teams. So far as we have space we will print your letters each month on the boys' and girls' page. We will not be able to print them all but if you want to hear from other boys and girls we will print your name and address. By the way, if you have a good snapshot, send that along too. We especially need a few pictures of farm Boy Scouts and 4-H boys and girls.

the drawing may be enlarged or reduced to any size within the scope of the pantagraph.

What Is a Radio Amateur?

AMATEUR:—One who cultivates an art or pursues a study from love or attachment, and without reference to gain or emolument.

WEBSTER'S DICTIONARY

THIS definition fits the radio amateur very well. Little does the ordinary broadcast listener realize that there are many thousands of private radio stations in this country as well as abroad, with both receiving and transmitting apparatus, communicating not only with others in our own country, but direct with amateurs in all parts of the earth.

These stations use short wavelengths principally—20, 40 meters etc., so are not within the range of the broadcast listener's set. Those who have added short-wave adapters, however, have discovered something about these fellows, some using ordinary voice communication by radiophone, and others employing the dots and dashes of the Continental radio code.

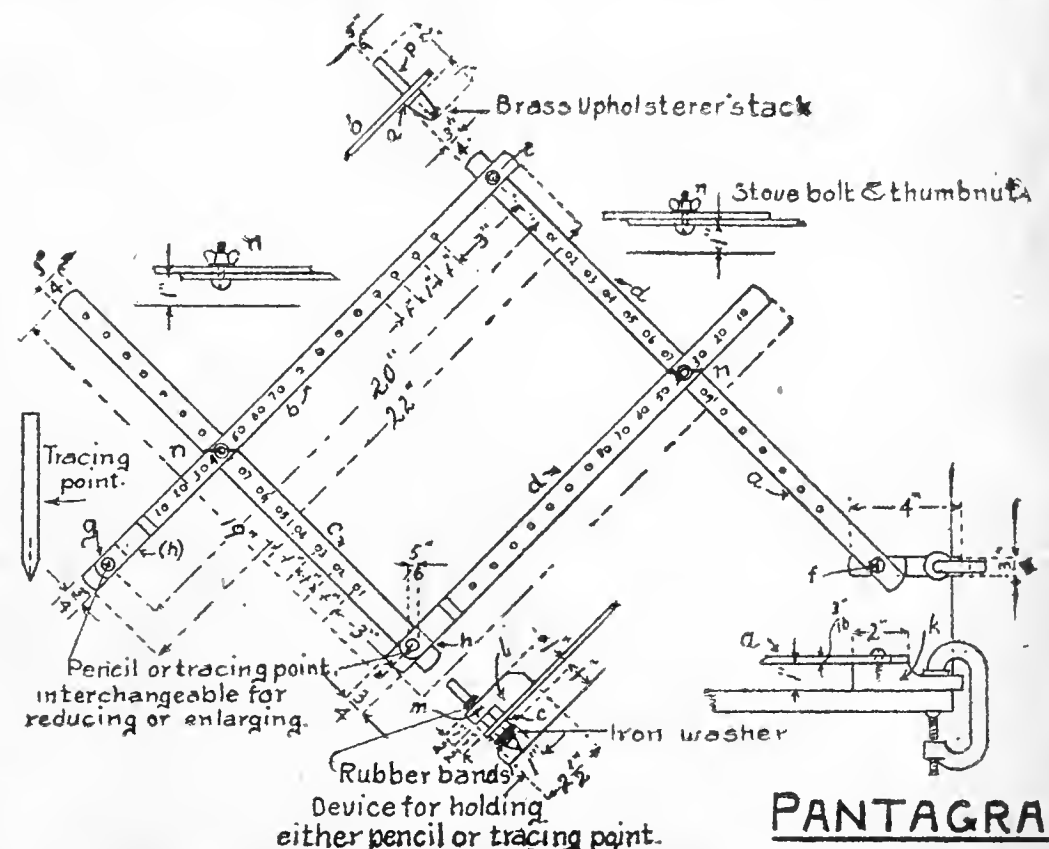

Amateur Radio is one of the most fascinating hobbies there is. The writer, for example, has received acknowledgments from European amateurs, although using only a small radio tube such as used in ordinary receiving sets, and with power from a few "B" batteries.

International Laws made in 1912 permitted amateur operators to use
(Continued on Page 17)

How to Make a Pantagraph

THIS device may be made by any seventh or eighth grade member of the "Handy Boy" club who can use tools with fair skill, and when completed may furnish much entertainment in enlarging or reducing photographs, pictures or drawings.

In making the pantagraph get out two pieces a and b of malogany or any well seasoned wood of medium hardness, 3/16" x 3/4" x 22"; also two pieces c and d 3/16" x 3/4" x 19". Mark centers of holes e f upon piece a, 20" to centers; at e of piece a bore a 5/16" hole, at f bore a 1/4" hole. At e and g of piece b bore a 5/16" hole, all 20" to centers. Beginning 3" from center of either of these holes mark accurately and bore 3/16" holes 1" to centers, fifteen of these in each piece. At h of c and d bore a 5/16" hole 1" from the end; beginning 3" from the center of each mark fifteen points 1" apart and with these as centers bore 3/16" holes. Make piece k 3/4" x 1" x 4"; glue sandpaper to the bottom to prevent slipping. Make two pieces l 3/4" x 1" x 2 1/2"; bore 5/16" hole at m. Fasten one of these pieces to the top of d with glue and small brads so the hole will coincide with holes h of c and d for a pencil passes through them and form the pivot for that angle. The pencil may

Pruning Grapes by the Kniffen System

WHEREVER grapes are grown on a commercial scale the winter months are the time for trimming the vines. There are a number of systems of pruning, including the Chautauqua System and the Kniffen. While in Western New York at least, the Chautauqua System seems to meet with most favor, experts are inclined to recommend the Kniffen System.

The Kniffen system before trimming
—Photo, Courtesy Maryland Experiment Station

Briefly, vines are trained to this system as follows: When the vines are set out they are cut back to two buds and this operation is repeated at the end of the first growing season. That will mean that the top, after pruning, is no larger than it was the previous year, but the root system will be much more extensive and a larger top will grow during the second year than grew the first year.

Early in the second season of growth the strongest shoot can be selected and the others rubbed off so that the growth will be restricted to this one shoot. The vines may be staked during the season to get them off the ground, or the lower wire of the trellis may be put up and the vines tied loosely to it. Often they are allowed to run on the ground.

The next season the single cane which was chosen the previous year is tied to the top wire and cut off just above the wire. It is usually also tied to the lower wire rather loosely so as to support it. The trimming for the

The Kniffen system. A vine after pruning.
—Photo, Courtesy Maryland Experiment Station

third season's growth will leave nothing but this single upright cane. As shoots develop they can be rubbed off, repeating the operation two or three times during the summer.

The fourth winter or spring, four canes are selected for the producing wood. Two canes go each way from the trunk along the lower wire, and two canes each way from the trunk along the top wire. Usually for a vigorous Concord grape, forty buds are left. However, it is recommended that the top canes be longer than the lower canes because they are inclined to grow more vigorously.

Now we have a full-grown vine and each year it is trimmed back to four canes containing a total of about forty buds. In order to do this, the grower, when he prunes the vine, leaves four spurs in addition to the four canes which are to bear the next season's

crop. This simply means that four canes are not cut clear back to the main stem, but are left with about two buds. These develop and furnish the framework for the next season's wood.

Fillers in the Orchard

Are the advantages of fillers in an orchard sufficient to warrant setting them out?—S.D., New York.

THE disadvantages, as you know, are added difficulty in cultivating, spraying and other orchard operations, together with the danger that they will not be removed sufficiently early to prevent damage to the main orchard. There is always a temptation to leave them one more year. We believe that it might be wise to give considerable attention to growing annual crops in the orchard rather than putting in fillers. Cash crops can be grown on small fruits such as strawberries or raspberries.

Buying Apple Trees

Is it advisable to buy one year or two year old apple trees?—N. W., New York.

HERE is apparently somewhat of a tendency to prefer good one year old trees. The first cost is a little less and they seem to stand transplanting better. It is stated that if one year old and two year old trees are planted side by side in an orchard, it is impossible to tell which is which in four or five years.

Apply Nitrogen Early

When heavy applications of nitrates are made we find that there is a tendency to have greener apples. How can we avoid this?

HEAVY applications of nitrates, of course, delay maturity and so decrease the speed of ripening. At the same time, nitrogen is necessary to get good growth. One thing that helps is to add nitrogen early in the season rather than later as this allows the trees to get the benefit of the nitrogen and at the same time have time enough to mature so that the apples will ripen up satisfactorily.

Early Cultivation Important

WHERE fruit growers follow the practice of cultivation followed by a cover crop, the importance of early cultivation is not always fully appreciated. Cultivation of the soil just as soon as it can be done in the spring not only kills weeds and prevents them from using nitrogen and moisture which the crop itself should have, but also hastens the process by which nitrogen is made available to the crop. In fact, it has been claimed that one early cultivation is about as beneficial as an application of fertilizer. Later in the season when the weather becomes warm nitrogen becomes more rapidly available and in time there is some danger that the fruit may get too much nitrogen. Then it is common practice to put in a cover crop which uses up some of this nitrogen, slows down the growth of the fruit and allows the wood to mature so that it goes into the following winter in good condition.

If cultivation is delayed in the spring the benefits from it are largely missed and if planting of the cover crop is delayed that does not benefit the crop to the fullest possible extent.

Top Working Kieffer Pears

In changing over from Kieffer pears to some other variety do you recommend Bosc or Bartlett?

GENERALLY speaking, growers seem to have had the best success with Bosc. Some have top worked Kieffers to Bartletts but others have reported rather discouraging results.

Burpee's Seeds Grow

Burpee's Annual abounds in interesting planting information and offers valuable suggestions as to the best and most profitable varieties to grow. It is an interesting book of 144 pages, with many of the leading Vegetables and Flowers illustrated in color.

New Vegetables and Flowers

Read about Burpee's new "Tangerine" Tomato, Burpeeana Cauliflower, that won the National Cauliflower Contest. Sweet Peas, Dahlias, etc. Burpee's Annual will be mailed free.

FREE TO FARMERS

The Cutaway Harrow Company, Higganum, Connecticut, are sending free to farmers two well-known books, "The Soil and Its Tillage" and the Clark "Cutaway" Catalog of disk harrows and plows. The first book contains much valuable information about modern farming methods; it tells how to get bigger and better crops with less time, labor and money.

The Clark "Cutaway" Catalog describes the "Cutaway" line of disk harrows from the Baby Cultivator and One Horse Harrow to the Double Action Tractor Harrows. It tells about special machines for special work such as the Bush & Bog Plow and Harrow, Orchard Plows, Single Action Extension Harrows, Smoothing Harrows, and others. The catalog also explains why disks with edges FORGED sharp, a feature found only on genuine Clark "Cutaway" harrows, STAY sharp and do not crack, break or chip.

Send for these two books today. A postal will do. Address: THE CUTAWAY HARROW COMPANY, 67 Main Street, Higganum, Connecticut.

20 GIANT ZINNIAS 10c

Send for World's Greatest Collection of Giant Zinnias—famous for size and beautiful colors—easy to grow anywhere and bloom from early summer until frost. This collection includes 20 gorgeous colors, as follows:

Bright Rose	Purple	Shrimp Pink

Assure
FULL VALUE
for your
FERTILIZER
DOLLAR

YOUR 1931 fertilizer dollar has a big job to do. It has to buy a full dollar's worth as never before.

That means not only so much potash, nitrogen and phosphorus, but the right amount of each for every plant.

It has to be a fertilizer that will save time and work. A fertilizer that drills easily and evenly, and helps you cut crop production costs to a minimum by giving you assurance of better yields of premium grade.

The certificate above is attached to every bag of Swift's Red Steer Fertilizers. It assures "Best Materials, Double-Mixed and Triple Tested." Fertilizer that is uniform, distributes evenly, economical to use, dependable in quality.

Look for this sign
of your A. S. A.

Thousands of farmers have learned to rely on this Certificate of Quality as a buying guide, have learned to choose Red Steer. They know what they are getting.

Do as they do. Buy fertilizer with this certificate as your assurance of the best value for your fertilizer dollar.

Look for it on every bag of Red Steer. This year, can you afford to buy fertilizer any other way?

Here's another way to cut costs! Ask your Authorized Swift Agent about Red Steer high analysis, especially 8-24-8 or 8-16-14.

Red Steer high analysis fertilizers give you your plant food at a saving of 10% to 15% or more in cost.

"IT PAYS TO USE THEM"

Ever look into a cow's stomach?

Of course not! But if it were possible you would be amazed at what goes on there!

You'd rush to the nearest feed store for Dried Molasses Beet Pulp—the natural vegetable feed resulting from the extraction of sugar from beets—the feed that keeps the cow's stomach in perfect working order. In addition to being a great feed itself it aids the digestion of the other ingredients in the ration.

Dried Molasses Beet Pulp is **bulky, cooling, laxative, palatable**—just the kind of feed every cow needs in her stomach to keep in perfect health. And your cows must be healthy to be profitable. Fits any ration—replaces corn, barley, oats, silage and other carbohydrate feeds. 6 pounds are equal to 10 pounds of hay. Good for all animals—dairy cows, beef cattle and sheep.

Attractive Prices

Present low prices make it more than ever a profitable buy. See your feed dealer without delay. Shipments made direct from factory closest to buyer.

Send for Free Booklet, "Profitable Feeding"

Weeding and Breeding Bring Results

By H. L. COSLINE

Associate Editor, American Agriculturist

IN last week's issue we tried to define some of the terms commonly used in livestock breeding. At that time we promised to give more definite recommendations which might be followed in building up a herd.

One way of securing a high-producing herd of cows or a prize-winning bunch of sheep or hogs is to go out and buy them from the fellow who has bred them. It is the quickest way and possibly the surest way. However, the fellow who has achieved success expects to be rewarded for the work he has done and is inclined to put a high price on the results of his labor. Then too, most of us do not have the necessary cash to go out and buy an entire herd and even if we did, we would be taking away much of the satisfaction that comes from doing the work ourselves.

In a previous article we spoke about selection. What chance does the average dairyman have in building up a fine herd through selection only? Well, in the first place, this depends upon whether he selects by guess work or from records. He should get steady improvement if he bases his selection on actual production figures, but unfortunately this improvement is slow—we might say too slow. We need to take advantage of the work that the other fellow has done and we need to take advantage of every method of building up our herd. Selection is just one method.

A Prepotent Sire Pays

Going a little farther and explaining what we mean by taking advantage of the other fellow's work, we have already spoken of buying the entire herd and for practical considerations have ruled it out. We can, however, buy the best herd sire we can afford, which for breeding purposes is half the herd. With a good herd sire and with records we are able to get good calves which can be selected for breeding purposes. If we just start with a rather mediocre herd and save calves only from the highest producing animals, we are likely to find after ten years that the progress has been disappointing. We may even find that all our selection has just about maintained the herd average. In other words, it takes some thought to keep our herd as good as it is and to prevent actual deterioration.

What should be our attitude toward purebreds or grades? We have heard a lot to the effect that a purebred herd is the best herd and we may start out with the idea that we can buy a purebred herd sire and a purebred cow and in

time raise an entire herd of purebreds from them. We can get a purebred herd this way, but this method has a number of handicaps. In the first place, we are likely to save all the offspring because we want to build up our herd as rapidly as we can. In other words, we are not practicing selection at all and when we finally get a herd we may be disappointed with its quality. We have actually seen this happen in a few cases.

Last week we said that for all practical purposes an animal that was thirty-one thirty-seconds purebred might be just as good as a purebred. Therefore, it seems to us that the logical plan for herd improvement is for us to buy the best herd sire obtainable. Of course, take into consideration the amount we can afford to pay. A long story could be written on how to pick out such a herd sire. Right now, however, we will merely give a few suggestions. First, we have to decide whether to get a young bull or an old one. A young bull may be prepotent and his offspring may produce heavily. If you are lucky in getting this kind of an animal, your problem is largely solved.

On the other hand, he may not be so good and you will not know it until three years, at least, have passed and his heifers are producing. You can buy an old herd sire whose daughters have shown that they are better than their dams, but the owner will probably charge you heavily for him. If you can afford the price, this will take much of the uncertainty out of your breeding operations. However, buying a young bull is not all guess work. A young herd sire whose immediate relatives are all high producers and excellent individuals, will, in all probability, improve your herd average remarkably. The nice thing about it is that you should be able to buy such an individual at a relatively low price.

Weeding Raises the Average

Even this process is slow because it will be approximately three years before the daughters of this sire will come into production. In the meantime, your herd average can be increased by weeding out the lowest producers through dairy improvement association work. While you are not making any of the cows better, you are raising your average and increasing your profits. This will also give you the records to be used as a basis for selecting the calves to be raised.

As time goes on and as your herd

How to Grow Peppers

Could you give us any information on how to grow peppers? We want to get some plants started in the house but they don't seem to come up. We have some very rich ground taken from where an old manure heap stood. The ground we are using is sandy loam. We would also like to know why peppers won't grow on black stony soil?

THE pepper is a warm season crop and the seed requires fairly warm conditions for germination. If you have tried to start the seed in a cold frame or in an enclosed porch, this might be the occasion of your trouble. I would suggest that you place the flat in the kitchen window or some other place where the temperature would be around 70. Of course it is possible that you had seed of poor germination. This you could determine by making a little test. I would place a couple of layers of blotter in a dish, count out, say fifty seeds and cover with another blotter or a piece of cotton flannel and by a piece of cardboard or another dish on top. Keep this moist and count the sprouts after several days or a week. Seeds ought not to be covered over a quarter of an inch in the flat.

Peppers require about the same conditions for their culture as tomatoes and eggplants. They do best on a fairly well enriched sandy soil in a warm location. I would not want to use a very rich soil such as an old manure heap would suggest. You are likely to have excessive growth of plant with poor setting of fruit. I do not believe that a moderate amount of ordinary stones in the soil would interfere, but if your black soil is poorly drained or very high in humus, you might have some difficulty. The setting of fruit in peppers is a little uncertain and we do not have much experimental work to give us a very clear idea of the causes except as suggested above. Cold rainy weather at the time of fruit setting is likely to interfere.

The Georgia Experiment Station at Experiment, Georgia, publishes Bulletin 150 on the culture of peppers. You might also write to the Bureau of Plant Industry at Washington, D. C. for their mimeograph on peppers.—Paul Work.

Greening Seed Potatoes

THE Ohio Experiment Station finds that better results were secured by either greening or warming seed potatoes before planting rather than to put them in just as they are taken from cold storage.

Seed kept at a temperature of 32 to 33 degrees Fahrenheit and immediately planted, produced 128 bushels to the acre. Seed kept at 36 to 40 degrees Fahrenheit, produced 148 bushels to the acre while seed kept in a barn basement at a temperature of around 36 degrees during the winter, but allowed to warm up in April before planting, produced 177 bushels per acre.

Bean Blight

"What control recommendations are usually made for bean blight?"

THE best control is to get seed which is free from this disease. The Michigan Robust pea bean is somewhat resistant to this disease.

Soaking the seed for from 18 to 20 minutes in a 1-1000 corrosive sublimate solution will decrease the losses from this disease.

Pruning Tomatoes

IT is generally believed that pruning of tomatoes although it may increase the individual size, lowers the total crop. Some Ohio experiments verify this idea. The loss in this test due to pruning varied from 6 to 18 per cent. In these experiments however, the individual fruits were not larger, but averaged smaller than those on unpruned plants.

He made his pasture his best-paying land

H. E. ROBERTSON of York, Pa., is a successful dairyman. The prize-winning Robertson Farm Holstein herd is one of the highest producing herds in the Northeast.

Mr. Robertson prospers because he is alert and eager to find new methods of increasing the efficiency of his farm and lowering his production costs. This is proven by steps he has taken to make his pastures pay him a real profit.

Milk at Lower Cost

Although he had a good pasture he became convinced that a fertilized pasture would enable his herd to produce milk at lower cost. Last March he fertilized four acres with 600 pounds of early potato fertilizer per acre. He compared milk production on that area with production on nine acres of unfertilized pasture.

The fertilized pasture furnished grazing 11 days earlier. This early grazing saved

\$144.08 in barn feeding costs. The fertilizer applied on the four acres cost \$49.60. For the pasture season the four fertilized acres produced as much feed as the nine unfertilized acres.

Use Your Potato Fertilizer

Without fertilizer, Mr. Robertson had one of the best pastures in Pennsylvania. With fertilizer, he converted it into the best-paying land on his farm.

It will pay you to grow good, cheap, green feed on a fertilized pasture and let your cows harvest it. This increases milk profits by reducing barn feeding and labor costs. Six weeks before you usually turn out your cows, use at least 600 pounds of a pasture fertilizer or a high grade potato fertilizer per acre on your pasture.

One Cow earns \$353 net in 10 months

**"and 3 others in same herd
milk from 73 to 80 lbs. a day
on B-B Feed"**

says Uncle Charlie

THE largest item of cost in maintaining your herd is feed. When you find a feed that produces the most milk for the least money—then your production costs are bound to come down.

To find that feed, you can profit by the experience of J. B. Dowden, of Alexandria, Va. When it came to selecting feed for his big herd of milkers, he tried out eight different brands—kept accurate records—figured costs. He reports:

"I tried B-B 20% Hi-Test during the hardest month of the year and my cows came right up on their milk, but still kept trying other feeds. In November, 1928, I came back to B-B Hi-Test and since then *haven't fed a sack of anything else.*"

Makes Association Record

"One of my cows (Dowden Grace Pontiac Rag Apple) led the cow testing association for the year, making 14,211 lbs. of milk and 543.4 lbs. of butter-fat during ten months. Fed entirely on B-B 20% Hi-test, she netted \$353.96 above feed costs. I have three other cows milking from 73 to 80 lbs. of milk a day on B-B."

Feeders everywhere are getting similar satisfactory results from B-B feeds. Wm. Kring, of Chester Springs, Pa., writes: "B-B is the best I've ever fed. My month's milk check from 15 cows was \$378.20. The feed cost me only \$82.50."

Make this Test at Our Risk

There's no reason why you can't get just as good results from B-B Dairy Feeds as any of the thousands of Bull Brand feeders. And you can try it out under a plan that involves no risk for you whatever. Just go to your dealer and order enough B-B feed to supply one or two cows for 30 days. (Write me direct if your dealer can't supply you.) Feed it according to directions and *watch the milk chart.* At the end of the trial period figure your profit for the month over and above the feed cost. If B-B doesn't come through with better results than you've had from any other feed, the dealer will return every cent you paid. He won't question your judgment or figures. Just give him the empty bags and your figures and he will hand over your money.

That's certainly a square shooting offer, isn't it?

LIVESTOCK
BREEDER

Silage for Sheep

I have a few questions I would like to have answered. Is good corn ensilage a suitable feed for breeding ewes and is it also suitable for lambs that are being fattened to sell in January? If it is how much should each receive for a daily ration? If the ewes and lambs receive clover hay with the ensilage how much grain and what kind should each be fed daily?

GOOD sweet corn silage is a suitable feed for breeding ewes and for lambs that are being fattened for sale. Silage should be considered as a supplementary feed—a succulent feed containing some grain. A mixture of 3 parts oats and 1 part wheat bran is good for the breeding ewes—if the ewes are thin 1 part of corn can be added to the mixture. One-half pound daily of such a grain mixture is usually enough for a breeding ewe that is getting good clover or alfalfa hay. The ensilage—to supplement it—should make it ideal. Two pounds of silage a day along with the other feed makes a nice allowance but as much as four pounds daily may be safely fed to breeding ewes during the winter if the silage is sweet, free from mold and made from mature corn. Probably more silage can be fed with safety after lambing than before. There are certain factors that have to be watched in feeding corn silage to in-lamb ewes, namely condition or quality and amount. Extreme methods are always bad.

Lambs being fattened on a suitable grain mixture and good hay will not be expected to eat as much silage as breeding ewes. As the lambs get on full feed of grain the roughage is naturally reduced. About two pounds of grain daily is a full feed for lambs being fattened. Corn is of course the universal fattener among the grains—barley is used a lot in western New York. A suggested ration to start with would be a half pound of grain, two pounds of clover hay, and one pound of silage daily. Lambs when on full feed should clean up their grain and eat the good or edible part of their hay. Some feeders feed a little wheat bran with the fattening concentrate which is a good practice as wheat bran has a beneficial effect on the system of the lamb. The amount of roughage fed will automatically take care of itself as the lamb gets on full feed of grain.

Results have shown that corn silage is about as efficient as root crops for sheep and considerably less expensive—succulence is very valuable for sheep—old-time shepherds put their faith in roots.—MARK J. SMITH.

A Question About Horses

What can I do for a six year old mare that has a discharge similar to the whites. She is stiff in her legs and acts like she has rheumatism. Two years ago she gave birth to a colt and was torn badly even though I had a good veterinarian attend her. Have not bred her since and she does very little work. I have some horses and colts that rub their necks and rumps, but cannot find any trace of lice. The colts rubbed all summer in the fences while on pasture.

THERE are many causes of itch in skin in horses and the treatment naturally depends on the nature of the trouble. From your letter one would think that your colts were troubled with mange in which good results follow cleansing the infected parts with soap suds using a brush if necessary. Then follow with the application of a disinfecting solution such as creolin, zenoleum or kresol, directions for use of which may be found on the container.

The so called "Whites" in the mare usually follow inflammation due to injury of parts as in foaling, retained after-birth and the like. If not properly attended, the discharge becomes chronic and the treatment calls for one skilled in attending such matters.

FOR SALE REGISTERED JERSEY BULL, nearly 11 months old; fine individual, richly bred. Crated F.O.B. Price \$50. Accredited herd. EUGENE F. WELLS, TULLY, NEW YORK

With the A. A. DAIRYMAN

(Continued from Page 8)

average increases from five thousand to six thousand, from six to seven, and perhaps finally up to ten thousand, you will find it increasingly difficult to find herd sires prepotent enough so that their offspring will produce more than their dams. You will probably have to pay increasingly large amounts to get this kind of a herd sire, but the nice thing about it is that your herd by that time will be so profitable that you will be able to pay the price your brother dairyman asks.

Aside from the profit, how much more fun it will be to watch the herd improve and the average production increase, than just to plod along from year to year with a herd that is just average or a little below. The man who has a herd with the ten thousand pound average is not just lucky. It has taken time, thought, and a lot of hard work, but the rewards certainly are worth the trouble.

Do not hesitate to write us if you have questions you would like to ask or to tell us your experience in breeding up a profitable herd.

A New Remedy for Milk Fever

FOR years the air treatment has been recommended for milk fever and has saved the lives of countless numbers of cows. Recently a new remedy has been discovered which may take the place of the old one. At the University of Minnesota careful experiments indicated that a low amount of calcium in the blood produced milk fever symptoms. Since that time calcium chloride has been used in several milk fever cases. A 20 per cent solution of calcium chloride is used and from 60 to 100 centimeters injected directly into the veins.

While inflating the udder with air has been fairly successful, there has been some danger of infection of the udder and there has also been some tendency to slow up milk production for a time. Then too, no one seemed to know just why this treatment worked or in other words just exactly what caused the disease. It will be interesting to note whether or not this new treatment works out successfully in all cases and becomes a standard practice for treating milk fever.

Large Cows Best

A STUDY of nearly 220,000 yearly individual records of cows in dairy-herd-improvement associations showed that within the breed the heavier cows in general excelled the lighter cows of the same age in production and income above feed cost.

The larger cows ate more in dollars' worth of feed per cow than the smaller cows, but they more than paid in production for the increased cost of feed.

Size of cow is only one of the factors that influence production and income above feed cost; it is not wise, therefore, to buy dairy cows on the basis of size alone. It is true, however, that if two cows are equal in all other respects the larger cow may be expected to produce more milk and return a larger income.—U. S., D. A. Circular 114.

"Holstein History"

AN interesting book has just come to our desk entitled, "Holstein Friesian History." The authors are Maurice S. Prescott and Frank T. Price of the Holstein Friesian World in collaboration with Henry H. Wing, president of the Holstein Friesian Association and Professor Emeritus of Animal Husbandry of the New York State College of Agriculture.

The book contains two hundred and fifty pages of Holstein information and we do not see how any Holstein breeder could afford to be without it.

**113 quarts
in every BAGFUL!**

MILK...113 quarts of it...in every bagful! This bargain is in your very town...in Checkerboard bags at The Store With the Checkerboard Sign. In each one of these bags are 100 pounds of Purina Cow Chows. In every 100 pounds of Purina Cow Chows are 113 quarts of milk. These are figures which come from a recent national farm-to-farm feed survey of 18 months ... a survey of 505,536 cows...a survey covering 48 states...a survey conducted by 870 men...a survey still going on.

When you buy feed for your cows you are buying milk in a bag. Consider, then, what a bargain you get in Purina Cow Chows...113 quarts in every bagful! 16 of these quarts are extra...over the average of more than 130 other feeds...so the survey reveals. 16 quarts that cost only 23c...just a bit more than one penny per quart...that's another bargain that awaits you in the Checkerboard bag.

Glance at today's price of 113 quarts of milk. Compare it to the price you pay for the Purina Cow Chows it takes to make it. A bargain you'll call it...a bargain that's all yours when Purina Cow Chows is your feed ...a bargain which is waiting for you in town...waiting in Checkerboard bags at The Store With the Checkerboard Sign. Purina Mills, 898 Gratiot St., St. Louis, Mo.

Reviewing the Latest Eastern Markets

Milk Prices

January Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		1.70
2A Fluid Cream	1.86	
2B Cond. Milk		
Soft Cheese	2.11	
3 Evap. Cond. Milk Powder		
Hard Cheese	1.80	1.60
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for December 1929 was \$3.42 for 3.5% milk and Sheffield's \$3.22 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Down and Up Again

CREAMERY SALTED	Jan. 9, 1931	Jan. 2, 1931	Jan. 10, 1930
Higher than extra	29	-29 1/2	29 -29 1/2 35 1/2-36
Extra (92 se.)	28 1/2	28 1/2	-35
84-91 score	25	-28 1/4	24 -28 28 -34 1/2
Lower Grades	24	-24 1/2	23 -23 1/2 25 -27

The butter market suffered another severe break during the week ending January 10, that carried prices down a full cent to 27 1/2c for creamery extras. The low spot was reached on January 6 and 7. The situation was attributed to too liberal supplies of fine quality butter. When the price got down to 27 1/2c however, buyers jumped in and took on stock freely. This made short work of the depression and by January 8 the market was back where it was at the opening of the week. As the market comes to a close, trading is very good and prices on top qualities are fully supported. Intermediate and lower qualities of fresh butter are really in short supply and held firmly. Values on these lower grades have been pushed up very close to the finest qualities under an active demand. A comparison of the above quotations very quickly shows how small the spread is between the prices of the lower grades this year and last, whereas the spread between the fancier qualities is quite pronounced. The present movement in the market emphasizes very clearly the trend of the buying practices of the consumer in the Metropolitan district. A dollar is being made to work more and go farther. Hence, the greater movement in the intermediate and lower grades.

It is very difficult to interpret the market as to what trend will prevail next week. Buying has been so heavy during this week ending January 10 that there may be a let-down next week particularly if prices are forced to any extent. Furthermore, fine qualities of held butter have not been offered very freely of late and these will come into the picture if prices advance.

The cheaper sorts of held butter have had fairly good movement.

Statistically, the market continues in a very favorable way. The out of storage movement has been consistently running ahead of last year and storage holdings are still approximately six million pounds short of the holdings a year ago. Were it not for the unfavorable economic and industrial situation the butter market would be situated favorably for higher and advancing prices.

Fresh Cheese Lower

STATE FLATS	Jan. 9, 1931	Jan. 2, 1931	Jan. 10, 1930
Fresh Fanny	18-19	19-20	19
Fresh Average			
Held Fanny			25 1/2-26
Held Average			23 -24

The cheese market lost a full cent this week bringing prices down to 18c to 19c. The market has been considerably unsettled by the weakness in fresh cheese in Western producing territories. It has been possible to buy fresh cheese for some time at inside quotations but eventually the Western situation carried the official figures down. Since the break which came early in the week ending January 10, trade has been dull and draggy as far as fresh makes are concerned.

The cured cheese market appears to be a little bit better. It is holding steady and here and there better inquiry is reported for early makes. However, there is no indication of any improvement in quotations. Prices on short held stock grading fancy to special being 21 1/2c to 22 1/2c.

The cheese market ended 1930 in a firmer position statistically, holdings being about 2,500,000 pounds under what they were the year previous. Furthermore, during the last week in December, the out-of-storage movement was almost twice what it was during the same period of the year previous.

Eggs Suffer Another Break; Make Some Recovery

NEARBY WHITE	Jan. 9, 1931	Jan. 2, 1931	Jan. 10, 1930
Hennery			
Selected Extras	32	-34	36 -37 1/2 47-48

NEARBY BROWNS			
Hennery	34	-35	41 -42 50-51
Gathered		-33 1/2	32 -40

The "Four Horsemen" hit the egg market this week and when they finished, the price column felt as though it had been hit by a barrage. Closely selected extras went as low as 32c, something pretty hard to imagine, but a fact nevertheless. Two factors were responsible for the blow-up, one real and the other a little hazy. It is a fact that supplies have been heavy. Large whites declined steadily under heavier supplies and medium whites were lower in sympathy. The somewhat hazy factor centered around advices from the West. These reports have indicated freer offerings of eggs in Western producing territories. The Chicago market weakened and some increase has been noted in the invoices of fresh eggs to arrive. (We do not guarantee the freshness of these Western eggs after they have been in the freight cars for several days). These "reports" and advices have a very definite influence on the mental state of some members of the egg trade and usually this condition winds up with the bears taking the upper hand. Many nearby producers have cut out the New York market entirely and are getting better prices locally.

It is difficult to understand how the Western producers can make money at the present prices. The very choicest Pacific Coast eggs have been bringing 33c, with a few reaching 33 1/2c. When sales and handling charges and transportation are deducted it is hard to see where a man is going to get enough to pay for his feed, labor, interest on investment, etc. Even though feed in the West may be extremely cheap, nevertheless it is not being given away gratis.

Statistically, the egg market shows the same spread over last year; namely about 700,000 cases in excess of the

holdings at this time last year. The year opened with storage stocks in the ten cities making daily reports, totaling 1,238,000 cases, approximately 700,000 cases in excess of the holdings at the same time a year ago.

Live Poultry

	Jan. 9, 1931	Jan. 10, 1930
FOWLS		
Colored	-28	30-32
Leghorn	19-23	27-29
CHICKENS		
Colored	22-25	23-25
Leghorn	20-22	20-22
BROILERS		
Colored	38-42	20-32
Leghorn	35-40	-28
OLD ROOSTERS	-15	-16
CAPONS	40-42	30-35
TURKEYS	35-40	25-30
DUCKS, Nearby	26-32	20-23
GEESE	-22	19-20

The situation in the live poultry market is so mixed that is hard to make any general statement. In the fowl market freight receipts seem to be a little in advance of the express market, although nearby colored birds were bringing more money. Leghorn fowls all around did not do so well. They were in excessive supply and some had to be forced out. Express broilers are experiencing a little trouble. Prices were pretty high for times such as those existing at present and now the young birds are experiencing pressure to sell, especially since many of the Rocks coming in are not any too fancy. Red broilers are much better as far as quality is concerned. Capons are bringing a better price. They usually do after the first of the year. Turkeys show considerable improvement, and ducks are also doing better. Shippers are warned to market with care to avoid heavy accumulations. Orderly marketing now will hold prices steady.

Meats and Livestock

CATTLE—Cows and bulls scarce, about steady, very little demand. Common to medium \$4.00-5.50. Low cutters and cutters \$2.00-3.50. Cutter to medium bulls \$4.50-6.00. No steers offered.

VEALERS—Steady. Good to choice \$11.00-14.00. Mediums \$8.50-10.50. Cull and common \$5.00-8.00.

LAMBS—One deck Good New York lambs around 25c higher at \$9.00.

COUNTRY DRESSED CALVES—Receipts during the week were moderate. Demand was slow. Prices were steady on top grades and higher on small. Market steady but not cleaning up. Fresh receipts, per pound: choice 14-15c; fair to good 12-14c; small to medium 10-12c.

HOTHOUSE LAMBS—Receipts light to moderate all the week. Demand good for fancy only. Prices slightly higher on tops. Market steady. Good to fancy, each \$7.00-11.00; imitations, each \$3.00-6.00.

RABBITS—Receipts light to moderate during the week. Demand slow in early part, moderate at end and at lower prices than previous week. Market steady at 15-20c per pound.

Fruits and Vegetables

There is no change in the apple market since last week. Offerings have not been over-heavy and they have been meeting quiet outlet at unchanged prices. Values range anywhere from 50c to \$2 per bushel basket depending on variety and quality, McIntosh topping the list.

Cabbage from New York State is doing a little better, bringing from \$21 to \$24 in bulk, which is approximately a \$3 advance over the recent market.

State carrots are showing some improvement, prices ranging from 75c to 85c per basket for washed stock while bagged goods brings 75c to \$1.

The celery market appears to be a little easier, although State prices still range from \$2.25 to \$2.50 per crate. California and Florida stock seems to be cutting into the market to hurt it.

Root stocks show little or no change. State beets generally bring 60c to 90c per 50 pound bag. Nearby parsnips bring from 50c to 75c per basket, and \$2 to \$2.25 per barrel.

Turnips bring 50c to 75c per basket. Rhubarbas generally bring \$1.25 to \$1.50 per 100 pound bag.

Nearby Marrow squash still bring

from \$1.75 to \$2 per barrel while Hubbards generally bring 25c more.

Onions continue slow and dull, with fairly liberal supplies on hand. Prices range from \$1.00 to \$1.50 per hundred depending on variety and source.

Potatoes Hold Steady

The potato market continues to rule firm and steady. Prices are generally the same as they were a week ago with the exception of fancy stock, which is bringing a premium. Some choice Maines are bringing \$3.25 per 150 pound sacks although the top of the market is around \$3.10 or \$3.15. Bulk goods from Maine sell over a range of \$3.50 to \$3.75. Long Island potatoes are sharing in the firmness. They generally bring \$3.25 to \$3.50 per 150 pound sack, with bulk goods ranging from \$3.85 to \$4.10.

Feeds and Grains

FUTURES	Jan. 9, 1931	Dec. 6, 1930	Jan. 10, 1930

The above quotations taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Hay Offerings Light

Supplies of hay were somewhat limited during the week ending January 10. Demand in general was active and sales generally averaged \$1 above the week previous. As the market closed on January 10 small bales were held firmer, stocks were low and buyers were seeking supplies. No. 1 straight timothy as well as No. 1 mixtures were scarce. Unless liberal supplies arrive over the week-end to disturb the situation, we look for higher prices next week. At this writing straight timothy brings from \$23 to \$28, while mixtures bring from \$19 to \$26.

Hides and Skins

Calfskins, green trimmed, New York City No. 1, 13c per pound, No. 2, 11c per pound; weights 9 1/2-12 1/2 pounds No. 1, \$1.60; 12 1/2-14 pounds No. 1, \$1.70 each; 14-18 pounds No. 1, \$1.90 each; 18 pounds and up No. 1, \$2.80; No. 2's buttermilks and branded proportionately less on foregoing weights; Deacons, 25-50c.

Honey

Market steady. Per pound: Clover extracted, in bulk, white, 9-10c; amber 9-10c; buckwheat, extracted, in bulk, 8-9c.

Wool

New York better fleece wool, unwashed, fine, per pound 21-29c; 1/2 blood 22-29c; 3/8 blood 23-28c; 1/4 blood 23-28c; low quarter blood 23-25c; common and braid 22-24c.

Roots and Herbs

Wild Ginseng selling very slowly. Well dried, New York and Eastern States, per pound: \$10.50, cultivated Ginseng, according to quality \$3.00-7.00 per pound for New York and Eastern States. Goldenseal; clean and well dried, New York and Eastern States, per pound 90c; Goldenseal; Leaves and stems New York and Eastern States 10c per pound.

Formulas for durable whitewash that will stick are given in the mimeographed bulletin 35-W. It is free on request to the Mailing Room, Roberts Hall, Cornell University, Ithaca, New York.

Quick! Look!... it acts TWICE

1st ACTION

2nd ACTION

See why Calumet's Double-Action makes all your baking better!

IT'S simply marvelous the way Calumet, *The Double-Acting Baking Powder*, increases baking success. Delighted women all over the country are turning to Calumet and baking with new confidence—new pride!

Calumet's Double-Action gives to cakes an unusual lightness and delicacy of texture. Calumet biscuits are tender, fluffy. Baking just seems bound to come out right with Calumet. That is what has made Calumet *the largest-selling baking powder in the world to-day!*

Calumet's *first* action, which begins in the mixing bowl, starts the leavening. Then, in the oven, the *second* action begins. It carries on the leavening. Up!... up!... it keeps raising the batter and holds it high and light. Your cake bakes beautifully, even though you may not be able to regulate your oven temperature with utmost accuracy.

Another delightful advantage—Calumet's perfectly controlled leavening action permits you to store cake batters until you are ready to bake them. Batter, poured into the baking pans, covered with a damp cloth and waxed paper, may be kept in the refrigerator for several days without loss in quality.

All baking powders are required by law to be made of pure, wholesome ingredients. But not all are alike in their action nor in the amount that should be used. And not all will give

you equally fine results in your baking. Calumet is scientifically made of exactly the right ingredients, in exactly the right proportions to produce perfect leavening action—Double-Action.

Convince yourself! Get a can of Calumet and try the delicious recipe given below. You'll notice that it calls for only *one* level teaspoon of Calumet to each cup of sifted flour. This is the usual Calumet proportion and should be followed for best results—a splendid economy which the perfect efficiency of Calumet's leavening action makes possible.

Recipes for all the good things on this page—Calumet Apple Cake, Plum Pudding, Pocketbook Rolls and Coconut Cup Cakes—are given in the new Calumet Baking Book. A wonderful collection of easy-to-make, sure-to-succeed baked dishes. Get your copy—mail coupon *now*.

CALUMET APPLE CAKE

2 cups sifted flour	2 tablespoons melted butter
2 teaspoons Calumet Baking Powder	4 tablespoons sugar
$\frac{1}{2}$ teaspoon salt	$\frac{1}{4}$ teaspoon nutmeg
4 tablespoons butter or other shortening	$\frac{3}{4}$ teaspoon cinnamon
$\frac{3}{4}$ cup milk	3 apples, pared, quartered and thinly sliced

Sift flour once, measure, add baking powder and salt, and sift again. Cut in butter. Add milk gradually until soft dough is formed. Roll $\frac{3}{8}$ inch thick on slightly floured board. Place in bottom of 8 x 8 x 2-inch pan. Spread with butter, sprinkle with 2 tablespoons sugar, nutmeg and cinnamon. Place apple slices on dough in rows, slices overlapping. Sprinkle with remaining 2 tablespoons sugar and a dash of cinnamon. Bake in hot oven (450° F.) 20 minutes, or until apples are tender. Serve with hard sauce.

(All measurements are level)

Test Calumet's Double-Action This Way... Naturally, when baking, you can't see how Calumet's Double-Action works inside the dough or batter to make it rise. But, by making this simple demonstration with Calumet Baking Powder and water in a glass, you can see clearly how Calumet acts *twice* to make your baking better. Put two level teaspoons of Calumet into a glass add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's *first* action—the

action that Calumet specially provides to take place in the mixing bowl when you add liquid to your dry ingredients.

After the mixture has entirely stopped rising, stand the glass in a pan of *hot* water on the stove. In a moment, a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's *second* action—the action that Calumet holds in reserve to take place in the heat of your oven. Make this test to-day. See Calumet's *Double-Action* which protects your baking from failure.

CALUMET

The Double-Acting Baking Powder

A Product of General Foods Corporation

The Key to 1931 Profits

FASTER WORK · BETTER WORK · LESS LABOR · LOWER COSTS

See what CASE offers for speeding up farm operations and reducing your cost of production

TO MAKE farming more profitable, this Company has placed itself in a position to furnish a quality machine for practically every farm use.

Throughout the entire full line from walking plows to combines, great improvements have been made, and many new machines brought out after prolonged development.

The new line of Case tractors, for instance, gives users what they have long wanted—an ideal combination of dependable power, compact size, light weight, fast speeds and ease of handling. Other new Case machines to make farming more profitable include a new line of grain drills, a new hay baler, a new silo filler, two new combines, a new power

binder, and others not yet advertised. Special tandem hitches for pulling drills behind disks, and harrows behind plows, etc., increase capacities and properly apply power.

Many improvements have been made. Construction throughout is simplified. Operation is easier. Performance is improved. As a result, Case users make more profit.

Determine now to know more about the features of Case machines which make possible faster and better work, with less labor, and the lower costs so greatly needed to make a profit in 1931.

Check the coupon for free descriptive literature on the machines in which you are interested. See your nearest Case dealer before buying.

Farm News from New York

Governor Roosevelt Presents Annual Message to State Legislature

EVERY citizen, whether he lives in the city or on a farm, is interested in the Governor's annual message to the Legislature, delivered January 7, which is in effect a summing up of progress made together with recommendations for legislation which the Governor believes should be passed. We regret that space will not permit publishing the message in full. We have summarized what we believe are the more important points from the viewpoint of our subscribers.

In speaking of agricultural conditions, Governor Roosevelt said:

"The past two years have placed the State of New York in the lead in remedial legislation for the farmers and rural dwellers. The Governor's Agricultural Advisory Commission which has been of such inestimable help, will continue, and will make further recommendations to bring into a more sound and equitable relationship the country and the city communities. In other words, we have progressed to the point where we can visualize and formulate a practical, definite and far-reaching land policy for the State. Long range planning for the character of the use of land itself has become almost a prerequisite to the building of arteries of transportation, the development of markets, the diversification of crops, flood control, reforestation and the many other needs that fall under the general head of agriculture, conservation and the even broader head of social economics. In a special message I will later outline this definite land policy, the adoption of which I believe would be of permanent value to every individual and every community."

Recommends Changes in Local Government

In spite of the large amount of legislation passed during the last two years increasing state aid to the rural sections for schools, roads, and other purposes, reports are coming to us that local taxes in some places are even higher than they have been in the past. The Governor's message contains the following recommendations concerning local government:

"In the interest of economy and efficiency I again urge upon you the necessity of a complete reorganization and modernization of local government. The machinery of village, town and county government, originally created many generations ago to meet the needs of those days, is now obsolete. I ask you to authorize a commission to be appointed by the Governor to study and report advisable fundamental changes. In the meantime I recommend that a constitutional amendment be adopted permitting the Legislature to provide modern forms of government for any county subject to referendum within that county. This, of course, does not contemplate the consolidation of counties in any sense; but rather an elimination of present overlapping functions of town and county offices so that local government may be administered more efficiently and economically."

Old Age Security

Our readers are greatly interested in the Old Age Security Law which was passed at the last Legislature. This interest is evidenced by the heavy correspondence which American Agriculturist has had from readers, asking for details concerning the Law. The Governor in speaking of this Old Age Security Law said in part:

"* * * I have many times stated that I am not satisfied with the provisions of this law. Its present form, although objectionable as providing for a gratuity, may be justified only as a means intended to replace to a large extent the existing methods of poor-house and poor-farm relief. * * * It is, therefore, my judgment that the next step to be taken should be based on the theory of insurance by a system of contributions commencing at an early age. In this way all men and women will, on arriving at a period when work is no longer practicable, be assured not merely of a roof over head and enough food to keep body and soul together, but also enough income to maintain

life during the balance of their days in accordance with the American standard of living."

Highways

"Construction and reconstruction of the State and county highway systems proceed at a faster pace than ever before, and in my budget I am asking for still larger appropriations. I am also asking that a large part of the funds be made immediately available in order that much of the work may be started this winter, so as to anticipate the employment of thousands of additional workers."

Other Recommendations

In addition to recommendations already mentioned which are of especial importance to our readers, there are several others which affect farm people less directly. A few of these recommendations follow:

Action to carry out suggestions for prison improvements including erection of a new type of prison.

Enactment of a labor program to widen the scope of workmen's compensation, to make effective a genuine eight-hour day and forty-eight-hour week for women in industry and to give them a fair wage board, and to obtain strict regulation of fee-charging employment agencies.

Larger appropriations for highways. Action to provide waterpower development by a public agency for the purpose of producing cheaper electricity.

More effective regulation of public utilities.

Reapportionment of legislative and Congressional districts.

Election law changes, including extension of bipartisan boards of elections to all counties.

Abolition of the state census.

Revision of the Baumes laws and the laws relating to the commutation and executive clemency.

A four-year term for Governor.

A Correction

In the report given in our January 3rd issue of the recent meeting of Governor Roosevelt's Agricultural Advisory Com-

mission, the name of Clark W. Halliday, Secretary of the Sheffield Producers Co-operative Association, Inc., was omitted by mistake. Mr. Halliday is an active member of this Commission. He is ever mindful of the interests of New York State farmers and of agriculture, and as a member of the Governor's Commission, his advice and work have been especially helpful.

Dr. Ladd Joins Henry Morgenthau, Jr.

HENRY MORGENTHAU, JR., newly appointed Conservation Commissioner has announced that Dr. Carl Ladd, director of extension at the New York State College, has been persuaded to obtain leave of absence from his college work in order to go to the Conservation Department as Deputy Commissioner.

We feel certain that our many readers will thoroughly approve of this selection. Dr. Ladd was born in Tompkins County, February 25, 1888, and since that time has served New York State farmers admirably in many capacities. He has taught school, has acted as director of one of the state schools of agriculture, was for a time head of the vocational agricultural instruction of New York State, has served as extension professor of farm management at the State College, and since 1924 has been director of extension at the New York State College of Agriculture. In 1928 Dr. Ladd spent six months in England starting research work for an institution there.

Recently he has been doing part time work for the U. S. Department of Agriculture and in his "spare time" has served as a member and secretary of Governor Roosevelt's Agricultural Advisory Commission. Dr. Ladd is known, liked, and respected by thousands of New York State farmers.

New Regulation Will Affect Cattle from Other States

EFFECTIVE March 1, Commissioner Berne A. Pycke of the New York State Department of Agriculture and Markets has issued a new ruling concerning the importation of cattle into New York State. In general, this means a tightening up

of the regulations under which cattle are brought in and will, we believe, be thoroughly approved by dairymen who own accredited herds or who contemplate testing their herds for tuberculosis in the near future.

Briefly, the order directs that cattle coming into the state be detained at their destination for inspection, examination, and tuberculin test and that they be quarantined from all other animals until released by written order of the Commissioner. Two classes of cattle are exempt from this order, namely, cattle for dairy or breeding purposes coming from a herd under official supervisions, accompanied at the time of import by an interstate shipment health certificate and a TB test chart; and cattle accompanied by a test chart indicating that they have reacted negatively to the tuberculin test within thirty days prior to import.

Any reader who contemplates the importation of any cattle should secure and study the complete copy of this order which may be secured from the State Department of Agriculture and Markets, Albany, New York.

New Milk Association Formed

WORD just comes to us of the formation of the Northland Dairy Association, claimed to include ninety per cent of independent shippers of milk into the metropolitan area. As all our readers know, the conditions surrounding the marketing of so-called loose or bulk milk in New York City have been far from satisfactory. From the producer's point of view, price cutting and racketeering have seriously lessened the price which he has received for this class of milk.

The new Northland Dairy Association is a cooperative non-profit association and will have general offices at Utica, New York. The officers of the company are: W. J. McKay, president; George B. Holder, vice-president; Will W. Hovey, vice-president; Jacob Rutishauser, vice-president; Ernest H. Sheldon, vice-president; Fred Dobmeier, temporary secretary and treasurer. Executive Committee are W. J. McKay, chairman, Clarence A. Brown, Will W. Hovey, Leo H. Cooley, Harry C. Taylor, G. A. B. Holder, and Ernest H. Sheldon.

The new association will not attempt to distribute milk in New York City, although some of the concerns involved have distributing facilities. It is claimed that when maximum spring production comes, the association will handle fifty to sixty thousand cans of milk a day.

Holstein Breeders Encourage Calf Clubs

THE New York Holstein-Friesian Association has been taking an active interest in 4-H Calf Club work by appropriating \$100 yearly in prize money for outstanding 4-H Dairy Clubs. Following are this year's winners:

First—Stockholm 4-H Calf Club of St. Lawrence County; second, New Paltz Club of Ulster County; third, Cambridge-Jackson Club of Washington County; fourth, Willing Workers of Massena, St. Lawrence County; and fifth, The Chenango County 4-H Calf Club.

The prizes were awarded on the basis of total enrollment, the number of club meetings held, the percentage of attendance, the percentage of members owning purebred cattle, and the general merit of the program worked out by the club. The winners of the contest wish to express their appreciation of the support given them by the New York State Holstein-Friesian Association.

Christensen Resigns

Chris Christensen, who has acted as secretary of the Federal Farm Board since its appointment, has recently resigned from the Board to become effective in the early spring, in order to become Dean of the Wisconsin College of Agriculture and director of the Wisconsin Agricultural Experiment Station.

New York County Notes

ERIE COUNTY—Western New York is particularly favored in the early months of 1931 with all five of the major agricultural gatherings either being held in its limits or having a distinctly Western New York flavor. The twentieth anniversary meeting of the New York State Vegetable Growers' Association though held in Syracuse has as its president a Western New York man, Albert Schillroth of Orchard Park, and at the State Convention and taking part in the program, was the president of the National Growers' Association, Henry Marquart, also of Orchard Park.

Western New York was also prominent at the annual meeting of the New York State Horticultural Society held in Rochester this week, as its president is William J. Hall of Lockport. Western New York not only had the National Grange Convention in Rochester in November, but is to have, too, the State Convention in Olean, beginning February 3. Following a custom adhered to since its institution the annual meeting of the Grange League Federation Co-operative Exchange, Inc., which is the world's largest farmers' purchasing cooperative, will be held on the day preceding the Grange Convention.

The following week is annual Farm and Home Week at Cornell University which, though not in Western New York, because of its nearness draws much of its attendance from this part of the state.

Hay is scarce and high, milk prices unsatisfactory, and potato and egg prices not worth mentioning, but the weather all through December couldn't be beat.

SARATOGA COUNTY—We had very fine weather for the holiday season with the usual amount of Christmas trees and entertainments at churches and schools. Roads are icy and some slight accidents

reported. Butchering work as usual. Beef and pork cheaper than last year. Eggs are going down in price. Some TB cattle testing is being done in this section. A few are cutting logs and wood. Milk and butter prices are low.—Mrs. L. W. P.

SULLIVAN COUNTY—Farmers are busy getting their wood as there are only about six inches of snow and it is ideal in the woods. Milk, eggs, butter, and all farm products have taken a big drop. Fresh cows can be bought for \$65 to \$75, the lowest in years. Leghorn hens 80c apiece; heavy fowls, \$1.25. Taxes are higher than last year. Many farms will be sold for taxes unless prices change. Feed sells for: bran \$1.55, meal \$2.00, wheat \$1.85.—Mrs. P. E. R.

STEBEN COUNTY—The hill roads have been mostly blocked since the first. Some snow fences have been placed in the valleys, but none on the hills where the snow gets the worst. It seems that the gasoline tax and auto license money ought to be enough so that some of it should be used to help the people back on the hills. Potatoes have been up to 80 cents. I have a truck with 1931 license which I cannot use because the roads are not open.—D. C. F.

OSWEGO COUNTY—December was a very fine month. The first day was a regular spring day but on the second it was down to zero. We had snow for Christmas but it was an ideal day. Good sleighing but no sleighs running, all autos. Today it has started in to storm. We all are hoping for a change in the times. We have not had any rain so the wells have not filled up. All produce is low. Eggs are selling 30c to 40c a dozen and other things about the same. Hay is quoted \$17. to \$20 a ton but not much is moving yet.—J. S. M.

He gets the Best grain Prices... by Telephone

A Bell System Advertisement

INCREASED profits from his sales of grain are made by a farmer near Athens, Ill., who uses his telephone to keep in touch with his local farmer's co-operative. His additional returns from this source amount to a substantial figure. Among other transactions, he sold 300 bushels of wheat at a price within one cent of the highest figure that was quoted during threshing time—a price that was from 10c to 15c per bushel higher than that received by many other farmers in his neighborhood. By keeping posted on the right times to sell, he is always assured of receiving the maximum return on his crops.

The telephone is equally helpful in promoting profitable sales of livestock, fruit and vegetables through co-operative associations or local markets. It is always valuable in keeping up friendly contacts, making engagements and summoning help when sickness or accident occurs.

The modern farm home has a telephone that serves faithfully and well, rain or shine.

Will You Accept This Book WITH MY COMPLIMENTS?

It tells how to raise a high percentage of strong healthy chicks. Contains more common sense information about brooders and brooding than any other book I have seen. The result of 30 years' experience.

Learn the secret of brooding success and you will have the key to poultry profits. Write today.

Advice for Beginners

I am strongly thinking of going into the poultry game on a light scale and thought perhaps I could get some good advice of you. At present, I'm working on a farm by the year and I don't seem to be getting anywhere at all. I have a small place in view which can be bought for five or six thousand dollars, about 35 acres of land, good house and barn and a real good poultry house equipped with an electric light plant.

Do you think I could work into a flock of three or four hundred White Leghorns and by growing berries and grain, make a go of it?—L. H. C., New York.

YOU ask if I think you can work into a flock of three or four hundred hens and by growing berries and grain make a go of it. I think it can be done under certain conditions, but whether you have those conditions, and are the man that can do it I do not know. I will tell you the conditions and you will have to decide if you can meet them.

(1) The farm must be bought at a price low enough that in case you want to sell it again you will have no difficulty in getting as much back as you put into it. You may have to borrow money from the bank sometime, and if they find you have paid too much for your farm they will conclude that you are a poor business man and probably refuse the loan. And incidentally there is no disgrace in going in debt if one borrows money to make money. That is the way practically all business is run. Wise and unwise borrowing might be illustrated this way; if you borrowed money to buy a radio it would be unwise since the radio would not help you to earn more, but might even take your time so you would earn less. But if you borrowed to buy a truck to increase your earning power enough to pay back the loan and leave you a good profit, that would be wise borrowing.

Working Capital Necessary

(2) You must have sufficient working capital left after you take possession of the farm so that you can buy feed for the growing chicks, supplies for the family and other expenses that will come up until you begin to get an income from the farm.

(3) You should know the berry and poultry game well enough that you won't make any big errors at the start, and so you can get average or better-than-average production of both berries and eggs.

(4) You should start out on a large enough scale that all of your time will be profitably employed. Probably seven or eight hundred hens and about one or two acres of fruit.

Now I suspect from your letter that you are not ready to meet all those conditions. If not, it would be well to start getting ready. Perhaps that farm will still be for sale a year or two from now. If not, that one—there will be others. Take your time. In the meantime you should locate a good-sized and profitable poultry farm where a man is wanted. Hire out to that poultryman and learn the business at his expense. You may save a lot of money and discouragement that way. By the end of a year or two you will be in a much better position than you are now to de-

Proper Connections To Hot Water Boiler

"I have a pressure boiler connected to a water front in a stove. Why do they put the supply pipe in at the top of boiler. It seems to me that it could just as well come in at the bottom."

It is very desirable to keep the hot water pipes between range and range boiler as short as possible, since pipe friction has a very important effect in keeping down circulation, and in fact the more compact one can keep the whole hot water system, the more satisfactory it will be. Also the more one can keep water pipes, especially hot ones, out of outside walls, the hotter the delivered water will be and the less trouble against pipes freezing. This should be carefully planned for in a new home, and often by slight rearranging can be secured in an old home.

You will find the proper connections for a water front and range boilers fully diagrammed and explained in Farmers Bulletin 1426 "Farm Plumb-

ing", which can be obtained free on request from the U. S. Department of Agriculture, Washington, D. C. Also "Simple Water Softeners and Plumbing". Cornell University, Ithaca, N. Y. The cold water supply pipe should go from the bottom or near the bottom of the range boiler to the lower opening in the water front. If yours is not that way, some one has made a serious mistake. The hot water delivery pipe should go from the top opening of the water front to the top of the range boiler, and this pipe should rise all the way. Any low places are likely to interfere with proper circulation and cause pounding. You can see from this that the hot water pipe should not go in at the bottom of the tank, because the whole tank full of water would have to be heated before any hot water could be drawn off. Formerly this pipe was brought in about two-thirds the way up on the side, but this also was slow about furnishing hot water.

How Circulation Pipe Helps

Where a sink or any other fixture is at a considerable distance from the range boiler, a single pipe to the fixture means that the long pipe full of cold water must be drawn off before any hot water can be obtained. This trouble can be remedied by using a circulation pipe, shown in dotted lines in the diagram. This means simply that a pipe is run out to a point just over or under the fixture and then brought back and connected to the cold water outlet from range boiler. The hot water constantly circulates in this pipe and only the cold water from faucet to the connection to the circulation pipe must be drawn before hot water is obtained.

There is not very much likelihood of the hot water getting hot and being forced back into the cold water supply tank, although when very hot fires are going and no hot water is used for a long time, the hot water in the range boiler may get below the bottom of the cold water supply pipe in the range boiler. Then if it continues to heat and the only chance for expansion is back into the pressure tank, some hot water may be forced back into it. Where a closed pressure tank is the supply, it is safest to install a hot water Safety release valve over a sink or a drain to open at several points in excess of the highest pressure to be carried on the pressure tank. Then when the water gets too hot and an otherwise dangerous pressure would be caused, this valve will open and relieve the pressure.—I. W. DICKERSON.

ing", which can be obtained free on request from the U. S. Department of Agriculture, Washington, D. C. Also "Simple Water Softeners and Plumbing". Cornell University, Ithaca, N. Y. The cold water supply pipe should go from the bottom or near the bottom of the range boiler to the lower opening in the water front. If yours is not that way, some one has made a serious mistake. The hot water delivery pipe should go from the top opening of the water front to the top of the range boiler, and this pipe should rise all the way. Any low places are likely to interfere with proper circulation and cause pounding. You can see from this that the hot water pipe should not go in at the bottom of the tank, because the whole tank full of water would have to be heated before any hot water could be drawn off. Formerly this pipe was brought in about two-thirds the way up on the side, but this also was slow about furnishing hot water.

You will be interested in the diagram (D-504) which shows the proper connections for both a furnace coil and a hot water front, which is what all farmers should have. In this it will be

What Is a Radio Amateur?

(Continued from Page 5)

any wavelength not over 200 meters. It was thought the problem of amateur radio was forever settled. But—in a few years amateur experimenters had gone lower and lower, until, with very low power, messages were passed between amateur stations on opposite sides of the earth. So, commercial interest rose, and now, the wavelengths below 200 are allotted to many other uses in addition. Broadcast programs from Europe, for instance, are sent here on these short waves and are then re-broadcast by our stations.

Becoming an amateur first requires knowledge of the code. Usually, a start is made by rigging up a receiving set for short waves. Amateur radio clubs conduct code classes for beginners. Before a Government license can be secured for a sending outfit, it is necessary to pass a Government examination (no cost) and secure an amateur radio operator's license. Then your horizon widens, and you'll find yourself "chewing the rag" with other amateurs hundreds and thousands of miles distant.

EDITOR'S NOTE—Any A. A. boy who wants more information about "radio amateurism" can get it by dropping a line to Brainerd Foote, A. A. Radio Editor, 461 4th Ave., New York City.

BABY

CHICKS

THE WHY OF KERR CHICK SUPERIORITY

LAYING inheritance, lusty vigor—these are the outstanding qualities of Kerr's baby chicks.

A rich inheritance from heavy-laying ancestry—a lusty vigor based upon a strong constitution transmitted from heavy producing stock. Baby chicks must have these qualities to make profitable layers.

The inherited prepotency for high egg yields of Kerr chicks has been proved beyond question in the great egg competitions and is now a fixed quality. Unusual care is exercised to guard against parasitic infection and diseases. Kerr chicks are available from B. W. D. tested stock. Send for the new Kerr illustrated Chick Book and prices. Sent free upon request.

cide whether you want to tackle a farm of your own or not. If you are the kind of man who can handle such a proposition you will not let what I have said discourage you in the least. Your dream of a nice home and education for your children can certainly be realized. I wish I could say "realized at once," but I have seen several cases of fine young fellows so filled with poultry enthusiasm that they could wait for nothing, not even a winter course in poultry raising at the Agricultural College. And their "discouragement and disillusionment" have been so pathetic that I don't want to see any one else jump in before they have learned to swim.

—L. E. WEAVER.

Laying Hens Need Water and Ventilation

ONE hundred hens laying heavily, will transpire three to four gallons of water as vapor in a day. The non-layers will give off only half as much. This would indicate that not only is ventilation essential to maintain a dry house, but that drinking water of sufficient quantity and of the right temperature, is required. Not only is water essential to maintain normal body functions, but is just as essential to the formation of the egg as fat or protein, a dozen eggs containing a pint of water. With eggs at only 30 cents a dozen, a gallon of water in eggs is worth over \$1.60.

My Experience With Turkeys in 1930

(Continued from Page 3)

old feed them just at night. This brings them up. I never have to go after my turkeys. To twenty-five poult give 1 tablespoonful of cottage cheese (made from sour milk) sprinkled with pepper.

This year I bought 100 pounds of starting mash with buttermilk and cod liver oil and mixed a little in the feed for the first two or three months. This is all the mash I used. After one month old gradually mix rolled oats and wheat in their feed. Do not overfeed. Give sour milk twice a day—all they will drink. After they are two months old I give them the sour milk at night. When the poult are five days old begin giving epsom salts. To twenty-eight poult give one teaspoonful in their feed twice a week, gradually increasing the amount and by October 1, give them one-eighth of a pint. I attribute my success with turkeys to these two articles.

No water is fed until they are four weeks old and then about half the time add to one gallon of water one-half tablespoonful copperas. Keep the poult out of the rain and dry, if possible, for at least twelve weeks, as a severe wetting at this age usually proves fatal unless they are taken into the house and dried by a fire. One of the troubles with turkey raising is that the flock often wanders on the neighboring farms. I keep mine not only on our own farm, but in a nearby field. I keep them in by placing a light board eighteen inches long across the turkey hen's neck, fastened to each wing with cloth strings. She cannot fly over fences. I leave this on until selling time.

Fattening for Market

Begin, about October 1 to fatten for the Thanksgiving market. Give old corn and wheat, or they can be fattened on either one alone. Begin gradually, taking two or three weeks to make the change in feed as an abrupt change in feed usually proves fatal. Feed in troughs—never on the ground. I found an ideal trough to feed small poult in until fattening time when I use large troughs, made like sheep troughs.

REDBIRD FARM
WRENTHAM, MASSACHUSETTS

(Continued from Opposite Page)

Take old auto tires and cut in the middle each one making two round troughs. These can be scalded each day and laid in the sun to dry. Everything must be kept strictly sanitary. Avoidance of parasites and prevention of disease should be the first aim of every turkey raiser.

Blackhead can be successfully controlled by proper sanitation. If everything is kept clean there will be no disease of any kind. Spread lime in places frequented by the turkeys. If possible it is a good plan to rotate turkeys as we do crops, putting them on new ground each year. I cannot do that but raise them just the same. As far as possible remove the cause of any disease that may appear. As I said before, clean soil, sanitary quarters, and hygienic methods of feeding will do much to reduce mortality.

Wheat or Corn for Poultry?

If you fill one open feeder in a pen of pullets with corn and another of the same size with wheat, which will be empty first? In other words, which do pullets prefer, corn or wheat? The answer might not always be the same in all flocks or at all times of the year. However, for the past two summers I have had an opportunity to observe the way two lots of about three hundred each responded to practically this same test. The response was the same in both cases. The grain mixture that these birds were getting was about three parts corn to two of wheat and they were cleaning up all the wheat and leaving part of the corn in the feeding trough. The mixture was then changed to equal parts of corn and wheat. Egg production increased because the birds ate more feed, but they still left part of the corn. The percentage of wheat was again increased to where they were getting two pounds of wheat to each pound of corn. All the grain was then cleaned up together.

This indicates that poultry will eat wheat at least as well as they will corn, and in some instances even better. There is very little difference between the two feeds as far as actual feeding value is concerned. Corn has always been predominant in the common poultry ration formulas simply because it was cheaper. This year the situation is changed. The corn crop is nearly a million bushels short of the normal. The wheat crop, both in this country and in the world as a whole, is considerably above normal. The result is that since July corn has been as high as wheat in price and part of the time even higher. Furthermore, the prospects are that this condition will continue for another year, or at least until the new corn crop is harvested next fall.

There is good reason, therefore, behind the suggestion that poultrymen may well increase the proportion of wheat in their poultry grain rations. Some, knowing that yellow corn contains an abundance of Vitamin A in which wheat is almost entirely lacking, may question the wisdom of such a move. However, every good ration contains cod liver oil and milk in the winter, as well as green feed or alfalfa or clover. All of these are rich in Vitamin A and the birds will never miss the yellow corn.—L. E. WEAVER.

When you count the eggs, enter the number in the record book. How to Keep a Poultry Account, that is sent free on request to the Office of Publications, New York State College of Agriculture at Ithaca, New York.

FYR-PRUF

(pronounced Fire-Proof)

THE SAFE CLEAN STOVE and NICKEL POLISH

Fyr-Pruf is absolutely safe because it cannot burn or explode . . . and also because it will not stain or irritate your skin. Simply use *cold* water and soap to quickly wash all trace from your hands. Fyr-Pruf is clean . . . never creates dust or leaves an odor. And Fyr-Pruf is really two polishes in one, for it cleans and polishes both stove and nickel parts in a single operation.

Ask your dealer for Fyr-Pruf stove polish . . . say "Fire-Proof" . . . and see how easily you can keep your stove looking like new.

Give Cabbage Its Due

Make Use of This Obliging Vegetable

WINTER is the time when cabbage has its real innings. Summer provides us lettuce and other green stuff right from the garden but in the winter they have to be bought. Then is when the keeping qualities of cabbage are really appreciated. But if the family is to stay appreciative, variety must be sought in serving.

Raw cabbage is better than cooked, for the main reason that cabbage loses more minerals in cooking than does any other vegetable. Valuable vitamins are also lost in the cooking.

Here are some things you can do to raw cabbage to make a variety of good salads:

1. Chop or shred finely and have it crisp and cold.
2. Mix equal parts shredded cabbage and diced apple, serve with boiled or mayonnaise dressing.
3. Combine cabbage with grated carrots and chopped onion.
4. Carrots and orange, diced pineapple and cocoanut, nuts and pineapple, orange and cocoanut or cut celery and nuts may be combined with cabbage.

handy knife sharpener is an absolute necessity.

It is not necessary to buy knives in sets, but one can build up her own set. The one who is to use the knife should try the handle in her own grasp to see if it fits and feels balanced. To be strictly modern, the handles will be of a color to match the kitchen color scheme. To hold the color and shape of the handles, one has to keep them out of water, for this not only spoils the finish, but loosens the wood. The blades should be of stainless steel. This saves lots of scrubbing, as well as prevents darkening fruits or fingers.

A good knife deserves a good place to rest, and this is not tumbling about with a drawer full of spoons and forks. A rack with a niche for each knife or a drawer where the blades are away from contact with other tools is the best way to keep them free from nicks or dullness.

A kitchen should have forks, of course, one short and one long-handled. These, too, may be had in stainless steel.

Bedroom set No. C124, stamped for cut-work embroidery in waterlily design, is most attractive. A lesson chart is enclosed with each article showing how it is to be worked. The buttonhole stitch is used entirely. Pillow cases are of fine quality tubing, size 42 x 36 inches, hemstitched for crochet edge, \$1.00 per pair, floss 35c extra. The scarf and 3-piece vanity set are of a splendid grade cream oyster linen. Scarf 18 x 45 inches, 65 cents; floss, 45 cents. Vanity set, 35 cents; floss, 25 cents. Order from Embroidery Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, New York.

The following recipe for boiled dressing is recommended by the New York State College of Home Economics:

A good boiled dressing to use with cabbage salad is made by heating one cup of vinegar and mixing together and adding one-third cup of sugar, one teaspoon mustard, one tablespoon flour, one teaspoon salt, and a dash of paprika. Beat yolks of two eggs well, pour the hot mixture gradually over the yolks, stir it constantly and cook it over hot water until thick. After removing it from the fire, add two tablespoons butter.

The Right Knife for the Task

A WOMAN may be able to mend the flivver with a hairpin and a nail file, but, when it comes to kitchen work, she needs the knife which fits the task. Paring is very different from slicing, spreading is something else again. When I see a woman attempt to spread butter with a pointed paring knife, then I know she has never considered whether she is wasting motions or not. A flat blade, either of spatula or case knife, would accomplish the task in half the time.

If you have ever tried turning fritters with a narrow bladed, stiff knife, then you could appreciate the ease with which this is done with a broad spatula. If you have this handy article, no pancake turner is necessary, for it answers that purpose, as well as many other purposes.

The list which meets the needs of most kitchens is as follows: a grapefruit knife, two paring knives, a case knife, a general utility or boning knife, a slicer, a carver, one narrow spatula, one broad spatula, two forks, and a serrated bread knife.

Good knives cost money, but once supplied and cared for, nothing about the house gives more satisfaction or comes nearer being worth its cost. A

Tested Recipes

Lima Bean Cakes

Press cooked lima beans through a sieve and to three cupfuls add the yolks of three eggs, one tablespoonful parsley, and a little grated onion. Shape in small cakes, dip in the beaten white of the egg and then in crumbs, and fry either in buttered pan or deep fat.

Baked Lima Beans

Cook the beans until they are about half done. Drain, season with salt and pepper and a slice of minced onion, pour in one-third as much tomato soup (canned) or tomato that has been put through sieve. Put in baking dish, cover top with strips of bacon and bake in moderate oven until beans are tender, then increase heat to brown bacon.—L. M. T.

To separate a head of lettuce easily cut out the stem end and allow cold water to run with some force into the cavity.

For the Bathroom Window

A distinctive curtain is number M667, which had for its inspiration an ultra smart idea. Once we saw a real aquarium built into a lovely luminous window, and so here is a similar effect on a white marquisette curtain with a crisp organdy sea, and gingham shadow applique designs of sea life. Shadow applique is made by stitching the designed units without turning seams between a filmy curtain and its wide hem, so that the light shows through the whole.

We assemble the curtain in a one-yard length of double dotted white marquisette 36 inches wide with a 9-inch hem of permanent finish swiss organdy and appliques of gingham in coral, yellow, orange and green. This is order number M667. If you want a wax pattern only, to use with your own material, order number M667P.

M667 1 yard. Marquisette Curtain with organdy hem and appliques \$1.00
M667P Wax Pattern20

Best Remedy for Cough Is Easily Mixed at Home

You'll never know how quickly a stubborn cough or chest cold can be conquered, until you try this famous recipe. It is used in millions of homes, because it gives more prompt, positive relief than anything else. It's no trouble at all to mix and costs but a trifle.

Into a pint bottle, pour 2½ ounces of Pinex; then add plain granulated sugar syrup or strained honey to make a full pint. This saves two-thirds of the money usually spent for cough medicine, and gives you a purer, better remedy. It never spoils, and tastes good—children like it.

You can actually feel its penetrating, soothing action on the inflamed throat membranes. It is also absorbed into the blood, where it acts directly on the bronchial tubes. At the same time, it promptly loosens the germ-laden phlegm. This three-fold action explains why it brings such quick relief even in severe bronchial coughs which follow cold epidemics.

Pinex is a highly concentrated compound of genuine Norway Pine, containing the active agent of creasote, in a refined, palatable form, and known as one of the greatest healing agents for severe coughs, chest colds and bronchial troubles.

Do not accept a substitute for Pinex. It is guaranteed to give prompt relief or money refunded.

HOUSE LIGHTING

Aunt Janet's Corner

Dark Days Ask for Aids to Brightness

DARK days, wet clothes, children with colds and goodness only knows what else can make winter something to be endured rather than enjoyed. Yet there is so much to give pleasure if only we take time to find it.

First of all comes the mental attitude towards winter. In some families there is much talk about how disagreeable the weather is, how uncomfortable everybody is, and a general over-emphasis of the discouraging features. Now it happens that the weather is one thing we humans can do nothing to change—it remains our province, however, to decide whether we shall meet it gaily, take it as it comes, or go around fretting and rebelling against something that all our worry will not help in the slightest.

He is a poor provider, of course, who does not prepare for winter before it is upon him, but once it arrives, he should use it for all sorts of activities the busy season does not permit. But it is the home itself, the center of family activities, that determines whether a gloomy or a cheerful outlook will prevail.

On my desk I have a batch of samples of pretty cotton materials. Although the sky outside is overcast and

there is snow on the ground, these satisfying colors give my soul a lift and make the day brighter. I have the same feeling of pleasure when I see a woman in a colorful housedress or a becoming apron. Now, of all times of the year, is the time to cheer up a dark interior by such devices, rather than take the opportunity to wear out an old dark woolen frock. It can be used in other ways, cut down for the children, made into rugs or other useful articles, so as to satisfy even the most thrifty. But the family ought to be able to remember its presiding genius as good to look at—which is hard to do in gloomy clothes. A bright pillow or hanging, a colorful lampshade, a neat, warm room, an inviting chair, an interesting book—what a lot of pleasant things we can think of!

A new game, a little treat, an occasional surprise, and above all, an atmosphere of "Let it do its worst and see if I care," will ease the whole family over many an uncomfortable situation when the spirit within the house must supply the sunshine rather than depending upon the sun without.

Winter time is home time and family time on the farm. But home and family need all the boosts they can get to make themselves the attractive possessions the poets sing about.

—AUNT JANET.

Smart and Slender

2890

Dress pattern No. 2890 gives matrons the opportunity to look smart and slender. The softly falling jabot, the deep vest, and the hip yoke opened at the front to give the skirt a panel effect, all have a decidedly slenderizing effect for the full figure. Black canton crepe is excellent, but wool crepe, flat or marocain crepe would be good for this pattern which cuts in sizes 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Size 36 requires 4 yards of 39-inch material with 1/4 yard of 18-inch contrasting. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with proper remittance in stamps (send no coin). Add 12c for one of the New Spring fashion catalogs and address to Pattern Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, N. Y.

Do You Know That—

The glossy finish of porcelain enamel table tops is dulled if fruit acids or sour milk are allowed to stand.

* * *

Three rules for preparing dried fruit are: wash it thoroughly in warm water, cook it slowly, and add the sugar at the end of the cooking period.

* * *

A guest-room convenience is a folding camp stool to hold baggage.

For Party or Graduation

2899

Girls' dress pattern No. 2899 is utterly charming for small daughter's party or graduation. It has distinct style touches in the pretty capelet and the circular peplum ruffles placed at the top of the circular skirt. For graduation, white voile, dotted net or crepe de chine would be lovely. For parties, pale blue, pink or Nile green in taffeta, crepe de chine, flat crepe or flowered organdie would be dainty and adorable. The pattern cuts in sizes 8, 10, 12 and 14 years. Size 8 requires 2 1/4 yards of 39-inch material. Price, 15c.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR

That's why

FELS-NAPTHA IS BOUND TO BRING YOU EXTRA HELP

And we'll prove it in a jiffy! Just lend us your eyes and your nose.

Hold up a bar of Fels-Naptha. What do you see? . . . soap! Rich, smooth, golden soap. All right, your eyes have found one helper. Now sniff the bar. What do you smell? . . . naptha! Plenty of naptha, the grease-dissolver. That's your second helper.

And there's the whole story of Fels-Naptha's extra help—two cleaners instead of one in every bar. Good golden soap and naptha working together—loosening even stubborn dirt and bringing you sweetly clean clothes, whether you soak or boil; whether you use tub or machine, hot, lukewarm or cool water.

Thanks to Fels-Naptha's extra help, no hard rubbing is needed. It saves you.

It saves your hands. It saves your clothes. And that's a bargain you can't afford to miss. Ask your grocer for Fels-Naptha today.

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Dept. 1-1-17. Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR

FELS-NAPTHA

Too much ACID

Many people, two hours after eating, suffer indigestion as they call it. It is usually excess acid. Correct it with an alkali. The best way, the quick, harmless and efficient way, is Phillips' Milk of Magnesia. It has remained for 50 years the standard with physicians. One spoonful in water neutralizes many times its volume in stomach acids, and at once. The symptoms disappear in five minutes.

You will never use crude methods when you know this better method. And you will never suffer from excess acid when you prove out this easy relief. Please do that—for your own sake—now.

Be sure to get the genuine, prescribed by doctors for conditions due to excess acid. It is always a liquid; it cannot be made in tablet form. Look for the name Phillips' and the word genuine in red.

GLEAMY WHITE TEETH
AND A SWEET BREATH

Try Phillips' Dental Magnesia Tooth-paste just once and see for yourself how white your teeth become. Write for a free ten-day tube. Address The Phillips Co., 170 Varick Street, New York, N. Y.

AMERICAN AGRICULTURIST

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David's latest escapade is the release of a crow that Perry Larson had captured by endless patience and staked out in the cornfield to keep other crows away.

David is lonely but a new friend cures this trouble. Blind Joe Glaspell, who plays the violin, arouses David's sympathy and he loans Joe his father's violin. Soon David makes another acquaintance, Miss Holbrook. He names her "The Lady of the Roses."

David meets "Jack and Jill" when they rescue him from a rough and tumble scrap with a gang of boys who are tormenting Jill's kitten.

David goes home with Jack and Jill. It appears that Jack and the Lady of the Roses are not on friendly terms.

"Oh, yes, I do," breathed David, his eyes pensively turned toward a shadowy corner. "He found his work out in the world, and then he had to stop and couldn't do it. Poor Mr. Jack!"

CHAPTER XIII

A SURPRISE FOR MR. JACK

LIFE at the Holly farmhouse was not what it had been. The coming of David had introduced new elements that promised complications. Not because he was another mouth to feed—Simeon Holly was not worrying about that part any longer. Crops showed good promise, and all ready in the bank even now was the necessary money to cover the dreaded note, due the last of August. The complicating elements in regard to David were of quite another nature.

To Simeon Holly the boy was a riddle to be sternly solved. To Ellen Holly he was an everpresent reminder of the little boy of long ago, and as such was to be loved and trained into a semblance of what that boy might have become. To Perry Larson, David was the "derndest checkerboard of sense an' nonsense goin'"—a game over which to chuckle.

At the Holly farmhouse they could not understand a boy who would leave a supper for a sunset, or who preferred a book to a toy pistol—as Perry Larson found out was the case on the Fourth of July; who picked flowers, like a girl, for the table, yet who unhesitatingly struck the first blow in a fight with six antagonists; who would not go fishing because the fishes would not like it, nor hunting for any sort of wild thing that had life; who hung entranced for an hour over the "millions of lovely striped bugs" in a field of early potatoes, and who promptly and stubbornly refused to sprinkle those same "lovely bugs" with Paris green when discovered at his worship. All this was most perplexing, to say the least.

Yet David worked, and worked well, and in most cases he obeyed orders willingly. He learned much, too, that was interesting and profitable; nor was he the only one that made strange discoveries those July days. The Hollies themselves learned much. They learned that the rose of sunset and the gold of sunrise were worth looking at; and that the massing of the thunderheads in the west meant more than just a shower. They learned, too, that the green of the hilltop and of the far-reaching meadow was more than grass, and that the purple haze along the horizon was more than the mountains that lay between them and the

next State. They were beginning to see the world with David's eyes.

There were, too, the long twilights and evenings when David, on the wings of his violin, would speed away to his mountain home, leaving behind him a man and a woman who seemed to themselves to be listening to the voice of a curly-headed, rosy-cheeked lad who once played at their knees and nestled in their arms when the day was done. And here, too, the Hollies were learning; though the thing thus learned was hidden deep in their hearts.

It was not long after David's first visit that the boy went again to "The House that Jack Built," as the Gurnseys called their tiny home. (Though in reality it had been Jack's father who had built the house. Jack and Jill, however, did not always deal with realities.) It was not a pleasant afternoon. There was a light mist in the air, and David was without his violin.

"I came to—to inquire for the cat—Juliette," he began, a little bashfully. "I thought I'd rather do that than read to-day," he explained to Jill in the doorway.

"Good! I'm so glad! I hoped you'd come," the little girl welcomed him. "Come in and—and see Juliette," she added hastily, remembering at the last moment that her brother had not looked with entire favor on her avowed admiration for this strange little boy.

Juliette, roused from her nap, was at first inclined to resent her visitor's presence. In five minutes, however, she was purring in his lap.

The conquest of the kitten once accomplished, David looked about him a little restlessly. He began to wonder why he had come. He wished he had gone to see Joe Glaspell instead. He wished that Jill would not sit and stare at him like that. He wished that she would say something—anything. But Jill, apparently struck dumb with embarrassment, was nervously twisting the corner of her apron into a little knot. David tried to recollect what he had talked about a few days before, and he wondered why he had so enjoyed himself then. He wished that something would happen—anything!—and then from an inner room came the sound of a violin.

David raised his head.

"It's Jack," stammered the little girl—who also had been wishing something would happen. "He plays, same as you do, on the violin."

"Does he?" beamed David. "But—" He paused, listening, a quick frown on his face.

Over and over the violin was playing a single phrase—and the variations in the phrase showed the indecision of the fingers and of the mind that controlled them. Again and again with irritating sameness, yet with a still more irritating difference, came the succession of notes. And then David sprang to his feet, placing Juliette somewhat unceremoniously on the floor, much to that petted young autocrat's disgust.

"Here, where is he? Let me show him," cried the boy; and at the note of command in his voice, Jill involuntarily rose and opened the door to Jack's den.

"Oh, please, Mr. Jack," burst out David, hurrying into the room. "Don't you see? You don't go at that thing right. If you'll just let me show you a minute, we'll have it fixed in no time!"

The man with the violin stared, and lowered his bow. A slow red came to his face. The phrase was peculiarly a difficult one, and beyond him, as he knew; but that did not make the present intrusion into his privacy any the more welcome.

"Oh, will we, indeed!" he retorted, a little sharply. "Don't trouble yourself, I beg of you, boy."

"But it isn't a mite of trouble, truly," urged David, with an ardor that ignored the sarcasm in the other's words. "I want to do it."

Despite his annoyance, the man gave a short laugh.

"Well, David, I believe you. And I'll warrant you'd tackle this Brahms concerto as nonchalantly as you did those six hoodlums with the cat the other day—and expect to win out, too!"

"But, truly, this is easy, when you know how," laughed the boy. "See!"

To his surprise, the man found himself relinquishing the violin and bow into the slim, eager hands that reached for them. The next moment he fell back in amazement. Clear, distinct, yet connected like a string of rounded pearls fell the troublesome notes from David's bow. "You see," smiled the boy again, and played the phrase a second time, more slowly, and with deliberate emphasis at the difficult part. Then, as if in answer to some irresistible summons within him, he dashed into the next phrase and, with marvelous technique, played quite through the rippling *cadenza* that completed the movement.

"Well, by George!" breathed the man dazedly, as he took the offered violin. The next moment he had demanded vehemently: "For Heaven's sake, who are you, boy?"

David's face wrinkled in grieved surprise.

"Why, I'm David. Don't you remember? I was here just the other day!"

"Yes, yes; but who taught you to play like that?"

"Father."

"Father!" The man echoed the word with a gesture of comic despair. "First Latin, then jiu-jitsu, and now the violin! Boy, who was your father?"

David lifted his head and frowned a little. He had been questioned so often, and so unsympathetically, about his father that he was beginning to resent it.

"He was daddy—just daddy; and I loved him dearly."

"But what was his name?"

"I don't know. We didn't seem to have a name like—like yours down here. Anyway, if we did, I didn't know what it was."

"But, David,"—the man was speaking very gently now. He had motioned the boy to a low seat by his side. The little girl was standing near, her eyes alight with wondering interest. "He must have had a name, you know, just the same. Didn't you ever hear any one call him anything? Think, now."

"No." David said the single word, and turned his eyes away. It had occurred to him, since he had come to live in the valley, that perhaps his father did not want to have his name known. He remembered that once the milk-and-egg boy had asked what to call him; and his father had laughed and answered: "I don't see but you'll have to call me 'The Old Man of the Mountain,' as they do down in the village." That was the only time David could recollect hearing his father say anything about his name. At the time David had not thought much about it. But since then, down here where they appeared to think a name was so important, he had wondered if possibly his father had not preferred to keep his to himself. If such were the case, he was glad now that he did not know this name, so that he might not have to tell all these inquisitive people who asked so many questions about it. He was glad, too, that those men had not been able to read his father's name at the end of his other note that first morning—if his father really did not wish his name to be known.

"But, David, think. Where you lived,

wasn't there ever anybody who called him by name?"

David shook his head.

"I told you. We were all alone, father and I, in the little house far up on the mountain."

"And—your mother?"

Again David shook his head.

"She is an angel-mother, and angel-mothers don't live in houses, you know."

There was a moment's pause; then gently the man asked:—

"And you always lived there?"

"Six years, father said."

"And before that?"

"I don't remember." There was a touch of injured reserve in the boy's voice which the man was quick to perceive. He took the hint at once.

"He must have been a wonderful man—your father!" he exclaimed.

The boy turned, his eyes luminous with feeling.

"He was—he was perfect! But they—down here—don't seem to know—or care," he choked.

"Oh, but that's because they don't understand," soothed the man. "Now, tell me—you must have practiced a lot to play like that."

"I did—but I liked it."

"And what else did you do? and how did you happen to come—down here?"

Once again David told his story, more fully, perhaps, this time than ever before, because of the sympathetic ears that were listening.

"But now," he finished wistfully, "it's all so different, and I'm down here alone. Daddy went, you know, to the far country; and he can't come back from there."

"Who told you—that?"

"Daddy himself. He wrote it to me."

"Wrote it to you!" cried the man, sitting suddenly erect.

"Yes. It was in his pocket, you see. They—found it." David's voice was very low, and not quite steady.

"David, may I see—that letter?"

The boy hesitated; then slowly he drew it from his pocket.

"Yes, Mr. Jack. I'll let you see it."

Reverently, tenderly, but very eagerly the man took the note and read it through, hoping somewhere to find a name that would help solve the mystery. With a sigh he handed it back. His eyes were wet.

"Thank you, David. That is a beautiful letter," he said softly. "And I believe you'll do it some day, too. You'll go to him with your violin at your chin and the bow drawn across the strings to tell him of the beautiful world you have found."

"Yes, sir," said David simply. Then, with a suddenly radiant smile: "And now I can't help finding it a beautiful world, you know, 'cause I don't count the hours I don't like."

"You don't what?—oh, I remember," returned Mr. Jack, a quick change coming to his face.

"Yes, the sundial, you know, where my Lady of the Roses lives."

"Jack, what is a sundial?" broke in Jill eagerly.

Jack turned, as if in relief.

"Hullo, girlie, you there?—and so still all this time? Ask David. He'll tell you what a sundial is. Suppose, anyhow, that you two go out on the piazza now. I've got—er—some work to do. And the sun itself is out; see?—through the trees there. It came out just to say 'good-night,' I'm sure. Run along, quick!" And he playfully drove them from the room.

Alone, he turned and sat down at his desk. His work was before him, but he did not do it. His eyes were out of the window on the golden tops of the towers of Sunnycrest. Motion-

RAFTERS FOR GOTHIC roof barns. **WHIPPLE BROS. INC.**, Laceyville, Pa.

Just David

(Continued from Opposite Page)

less, he watched them until they turned gray-white in the twilight. Then he picked up his pencil and began to write feverishly. He went to the window, however, as David stepped off the veranda, and called merrily:—

"Remember, boy, that when there's another note that baffles me, I'm going to send for you."

"He's coming anyhow. I asked him," announced Jill.

And David laughed back a happy "Of course I am!"

CHAPTER XIV

THE TOWER WINDOW

IT is not to be expected that when one's thoughts lead so persistently to a certain place, one's feet will not follow, if they can; and David's could—so he went to seek his Lady of the Roses.

At four o'clock one afternoon, with his violin under his arm, he traveled the firm white road until he came to the shadowed path that led to the garden. He had decided that he would go exactly as he went before. He expected, in consequence, to find his Lady exactly as he had found her before, sitting reading under the roses.

MISCELLANEOUS

PEANUTS, HAND SELECTED and shelled, 10 pounds \$1.00. **W. W. WILLIAMS**, Quitman, Ga.

ACETYLENE, FIXTURES, LIGHTERS, ironers, gas stoves, Catalog free. **STANDISH LIGHTING**, Naples, N. Y.

CHAIR BOTTOMS—Material white oak splints, 1,000 feet, \$1.50; 3,000, \$4.00. Postpaid. **DAVID HARDIN**, Patesville, Ky.

FOR SALE—Stewart electric shearing machine, also hand power shearing machine, both in excellent condition. Real bargains. **GEO. WENDIG**, Richboro, Pa.

10 LBS. BEST MAPLE sugar \$2.50. **WILL GROVER**, Bristol, Vt.

CHOICE FLORIDA ORANGES, grapefruit, tangerines; sweet, juicy, full-flavored. Full standard bushel, straight or assorted, \$1.75 with order, express charges collect. Medium grade oranges \$1.25. Satisfaction guaranteed. **MRS. HELEN THOMAS**, Box 104, Thonotosassa, Florida

PATENTS

PATENTS, TIME COUNTS in applying for patents. Send sketch or model for instructions or write for free book, "How to Obtain a Patent" and "Record of Invention" form. No charge for information on how to proceed. **CLARENCE A. O'BRIEN**, Registered Patent Attorney, 73-Y, Security Savings and Commercial Bank Bldg., Washington, D. C.

Great was his surprise and disappointment, therefore, to find the garden with no one in it.

He had told himself that it was the sundial, the roses, the shimmering pool, the garden itself that he wanted to see; but he knew now that it was the lady—his Lady of the Roses. He did not even care to play, though all around him was the beauty that had at first so charmed his eye. Very slowly he walked across the sunlit, empty space, and entered the path that led to the house. In his mind was no definite plan; yet he walked on and on, until he came to the wide lawns surrounding the house itself. He stopped then, entranced.

Stone upon stone the majestic pile raised itself until it was etched, clean-cut, against the deep blue of the sky. The towers—his towers—brought to David's lips a cry of delight. They were even more enchanting here than when seen from afar over the tree-tops, and David gazed up at them in awed wonder. From somewhere came the sound of music—a curious sort of music that David had never heard before. He listened intently, trying to place it; then slowly he crossed the lawn, ascended the imposing stone steps, and softly opened one of the narrow screen doors before the wide-open French window.

(Continued Next Week)

HANDY ANDY Says "Here's How"

To Blast Rock

By Ray Inman

Blasting if done with ordinary precautions is as safe as other farm tasks.

Crimp all caps with cap crimpers instead of pliers. Make fuse at least 1 1/2 ft. long (FOR BLASTING MACHINES USE WIRE AT LEAST 200 FT. LONG)

Always face the charge, so that flying missiles may be dodged. Never investigate a delayed charge for 24 hours.

State

changed—or if perchance the sun was suddenly growing cold. Perhaps this was as near as we ever came to agricultural disaster but that year wheat was an especially abundant crop. The following winter was mild and the next spring flooded the land with light and warmth as usual.

This past summer we have experienced a wide-spread drought—possibly the most severe in the memory of man. In certain states it has taken on almost the aspect of a calamity and yet—taking America as a whole—we have wheat and corn and cotton and beef and pork and almost every other commodity beyond the ability of the world to consume. Nearly always it has been true that disaster has come to the American farmer not because the clouds have withheld their rain or because floods have ravaged the earth, but rather because the fecund earth has brought forth her increase until there is no room to receive it. In other and less fortunate regions of the earth—frequently in Russia and India and China there has been wide-spread crop failure so that millions have—and still do—die of hunger but, in our fat land, it is plethora rather than scarcity that troubles us.

Of a truth, we farmers are the most incurable of optimists. We do our fair share of good natured grumbling because prices are low and sometimes crops are poor, but each year anew we plow in hope and in faith we cast our seed. Always we are lured on by the unknown possibilities of another year. Even if this year was bad—perhaps next year will bring the long deferred fruition of our hopes. Perhaps our seed will bring forth an hundred fold and prices will be high and we will come into our own. And so we go on our always hopeful way.

*"Lo, Sun and Rain have wrought their yearly task,
Have given of their bitter and their sweet.
The earth that yields us freely when we ask
Has left her summer fruitage at our feet;
And now the trees and fields have earned their rest,
And we may read the message that is sent,
When we have done our all and done our best
We, too, may fold our arms and be content."*

Moreover it does seem that events have justified our optimism. Surely the farmer is a sort of hardy perennial with a strange ability to survive and to come back. Perhaps we have had more than our fair share of adversity. We once weathered a depression that lasted for fully twenty-five years. I have no time here to go into the causes leading up to it—but it is a fact that from soon after the Civil War until say about 1900, the farmer went through a period when prices fell remorselessly

year after year and when he asked—sometimes in bitterness—if there was to be no end to his troubles. Yet, with the turn of the century, things began to mend and from then until the breaking out of the World War was a period of slowly, and consistently advancing prices which I shall always rather fondly look back upon as a sort of Golden Age of Farming.

We Shall Survive!

Now I do not know what the immediate future holds. It is entirely possible that we shall have to make still further adjustments and learn to conduct our business still more efficiently—but I do know this. *Come what will—we shall survive.* Always there will be men scattering seed and reaping the harvest—and I fling it out as a boast—if the world should pass away in a sort of final economic cataclysm, the last man left alive will be an American Farmer.

And now it will hardly do to close this New Year's screed without some final phrase of New Year's counsel and felicitation. And I beg leave to take it from the prose writings of that best beloved of American Poets—Longfellow. Oh! I know it is now the fashion to pour contempt on him—the reason being perhaps that he is never pessimistic or blasphemous or obscene. But let me predict that Hiawatha will be read by the family fireside and generations of school boys yet unborn will declaim the Psalm of Life long after the author of Babbitt shall have crept into an unremembered grave.

And so my farm friends—the old year has brought to you varied fortunes. To some it has brought sorrow and defeat. To some it has brought hope deferred. To many I am sure it has brought very pleasant happenings that later will furnish a store of golden memories—but to all of you I offer this phrase of counsel from the poet of whom I have just spoken. *"Look not mournfully into the Past—it comes not back to thee again. Behold the present—it is thine. Go forth to meet the shadowy Future with brave resolve and with a manly heart"*. This is my New Year's wish for and message to you.

Loading Tractor is Factor in Cost

TWO factors are important in tractor costs. One is the number of hours used, the other, economical loading. The first entails a study of the machine's varied uses, and of the possibility of increasing these uses. The latter necessitates a study of the draft requirement of different implements, and the ways and means of devising tractor hook-ups.

An example will help to make this point clear. A 14-inch moldboard plow at a certain depth will have a draft of 600 pounds. A one-way plow 14-inches

wide would require a pull of about 250-pounds, while that width of spike-tooth harrow has a draft of only slightly more than 50 pounds.

Such a variation is true of all field implements, and to load a tractor of certain size economically, the operator must know the approximate draft of each tool.

In the case of the drag harrow, a three-plow tractor will pull a hook-up approximately 45-feet in width. Therefore, this size hitch should be used where it is feasible. On farms where the fields are not large, however, a 45-foot harrow would not be economical. Instead a tandem hook-up should be used, such as a one-way disc and harrow, or pulverizer and drill.

Tractor engineers and farm management experts agree that each tractor owner should make a study of his machine to determine what will be an economical load, and then eliminate as much as possible the application of hitches with lower draft requirements. Manufacturers of tractors can furnish approximate figures on draft for each machine.

New Bulletin on Lawns

A NEW bulletin on the treatment of lawns has recently been issued by the New Jersey Experiment Station. It was written by H. R. Cox and is a handy reference book for those who wish to build a new lawn on the farm or renovate a lawn that needs building up. This new bulletin, gives the latest information on weed control and the proper use of lime for the growth of a proper turf. Mr. Cox states that soil acidity will not control weed growth and that lime may be applied with good results if the soil is too acid.

For those who are planning to start a new lawn the bulletin lists improved seed mixtures that are best adapted for specific locations. The booklet is furnished free to anyone writing for it.—A. K.

If the perches are painted once in a while with old crank case oil, mites will never bother the hens.

"Listen, old man—here's a couple of laughs for you."—JUDGE.

Wants Advance Listing Fee

WE have recently received several inquiries from readers as to the reliability of R. A. McNown of Omaha, Nebraska, who advertises that he can sell farms to cash buyers.

As we feared, this is another case where a man wants \$10.00 to list your farm. Whenever we have investigated such cases, we have always found that the man is much more interested in

examination you will stand no chance of an appointment until this waiting list is exhausted. As a general proposition we do not believe that it is worth while to take any correspondence course, preparing you to take such an examination. Our suggestion would be that you first make sure that there is a likelihood of your being appointed if you should pass and that you then write to the Civil Service Commission, at Washington, D. C., asking for information about the examination. Then study up as well as you can on the subjects which the examinations will cover.

We Are Glad to Help

ON December 2 I received a check from the Express Company for the crate of eggs which I sent on October 3 and which was lost.

I cannot express my gratitude and appreciation which I extend toward you for helping me collect the money.

I am not sorry that I am an A. A. member, because I have received service from the A. A. that I could not have received otherwise; therefore, thanks again for your interest in me.

getting the \$10.00 than he is in trying to sell the farm. Our consistent advice is never to pay an advance listing fee to any real estate agent. A person who is interested in selling your farm will be glad to take his commission after he has sold the farm and not before.

Total \$80,000

EARLY last spring we printed an item telling of the complaints we had received about the activities of Mr. Billings of Hornell who was selling what he called "blue and red inspected tourist home signs." At that time we pointed out that we had many letters from subscribers indicating that an investment in any sort of a tourist sign often did not prove profitable to them.

We now learn that many attorneys in the section around Hornell have affidavits from people who bought these signs, claiming that Mr. Billings did not do the things that he promised to do. However, so far as we know, no one has had the nerve to sue Mr. Billings to recover the money which they paid. We are informed from a reliable source that Mr. Billings sold about 2,000 of these signs at the price of approximately \$40 each. We are giving these facts to our subscribers in case they should be approached to buy a similar sign. Our subscribers have, in the aggregate spent an enormous amount of money for signs of this nature. Some of these associations are reliable in the sense that they do as they agree to do in their contracts, although even then, many of our subscribers report that they have not secured benefit which would pay them for the amount of money they have spent. In other cases, associations have been formed without much financial backing and have absolutely failed to live up to the promises which they have made. In such cases our subscribers usually find it impossible to locate the man or if they can locate him, find that they cannot collect from him.

Civil Service Jobs

Would you suggest that I take an instruction course from C. J. Ozment, of St. Louis, Missouri, to fit me for taking a Civil Service examination?

WE have always felt that most of the schools giving courses to fit students for taking Civil Service examinations are interested principally in the pay they get for putting out the courses. We do know that many government positions have a long waiting list and even if you pass an

organization. Every ex-service man, must, of course, judge for himself whether or not this is a worth-while organization to join. Frankly, it would seem that the organization is not yet on a very firm foundation and prospective members might well ask themselves what benefit they are going to get for parting with their money to become members.

Investigate Before Shipping Produce

THE Service Bureau will be glad to ascertain for subscribers whether or not a buyer is considered reliable in the market, and we suggest you inquire before making shipment.

The general business depression has been felt in the produce markets, and we hear of financial difficulties with any number of commission merchants and receivers of farm produce. We take this opportunity to remind subscribers again of the importance of investigating before they ship.

Get Experience First

THE New York State College of Agriculture gives some excellent advice to those who are interested in fur farming. They say, "Because raising animals for fur is a new business, it is easy to deceive a novice. Read the alluring announcements about fur farming but work on a fur farm for at least a year before investing in the business. Fortunes are not easily made in fur farming."

The A. A. Service Bureau adds a

hearty "Amen" to this advice. There is doubtless a future for fur farming, but certainly, in the past, many have lost money and probably many others will do so in the future.

State Checks on Gasoline Pumps

COOPERATION by consumers purchasing gasoline at gasoline stations in the drive to insure correct measuring by the pumps is urged by the Department of Agriculture and Markets.

A Friend in Need

I WISH to thank you for the draft of \$30.00 you so kindly sent me and I appreciate it very much. I rather hesitated when we subscribed to the American Agriculturist, thinking we had reading matter enough and never giving the insurance part of it a thought, because I had never been in an accident of any kind, but it has proved a friend in the time of need.

(Mrs.) Roy H. Roberts,
Silver Creek, N. Y.

Injured when struck by an automobile causing injuries about the right hip, thigh and leg.

This cooperation may be given, it is pointed out by Charles J. Reynolds, Director of the Bureau of Weights and Measures of the Department, by observing whether there is a seal on the pump showing that it has been tested and found to be correct.

It is suggested to operators of gasoline stations by the Bureau of Weights and Measures of the Department that they furnish themselves with a five gallon test can and test their pumps each morning before starting operation. It is stated that if a pump stands for seven or eight hours without being operated the first pumping will be far short of the amount registered.

For the last two months a special drive has been under way throughout the state in the testing of gasoline pumps at the various stations by the city and county sealers under the direction of the Bureau of Weights and Measures. The results of this investigation will be compiled later in the department.

Avoid Sending Cash Through the Mail

There is always some danger that money will be lost when it is sent through the mail. This is particularly true of coins. May we, therefore suggest that when you have occasion to send money to American Agriculturist, either for subscriptions, patterns, embroidery, trespassing notices, or insurance policies that you send either a check or postal money order. Where amounts are very small, stamps will be acceptable.

A Good Book on Carpentry

THOSE of our readers expecting to build or remodel or interested in any carpentry work will find much that is valuable in the book "Carpentry" by Townsend and published at \$1.50 by the American Technical Society, Chicago, Ill. It is a book of about 350 pages and profusely illustrated with diagrams.

This is a practical treatise on simple building construction by a practical building authority and includes framing, roof construction, general carpentry work, exterior and interior wall finish, flooring, and so on. It is especially good on joints and splices and wall construction, on roof layouts and rafters, on constructing the different types of roof trusses, or cornice and gutter work, on door and window construction including dormers, building forms for concrete construction, on the proper size and arrangement of reinforcing and the construction of concrete beams and reinforced slabs, on stucco and concrete finishes, blue print reading, and so on.—I.W.D.

IN PLANNING for this chick-raising season, there's one thing to keep always in mind—rear only chicks that are bred to produce and grow them well at minimum cost.

A large part of the chick-raising expense is the feed cost. And that is one place where you can save money this year, by dispensing with a high-priced special chick starter.

Thousands of poultrymen use G. L. F. Starting and Growing Mash, which costs less and provides all the food a growing chick can use. Each year the use of this feed has doubled, until last season more than 6,000,000 chicks were brooded with entire satisfaction on G. L. F. Starting and Growing Mash.

The tremendous increase in the use of this feed is due chiefly to three factors: 1. The open formula upon which this feed is mixed was developed and is recommended by the College Poultry Feed Conference Board. 2. All the ingredients used are fresh and of highest quality. 3. The feed is mixed and shipped into your community by your own organization, which means a material saving in feed cost.

G. L. F. Starting and Growing Mash is equally adapted to battery or colony brooding methods. It is a complete feed for chicks.

PRICE

The wholesale cost of G. L. F. Starting and Growing Mash delivered to G. L. F. Agent-Buyers in the Syracuse Freight Rate Zone is approximately \$50.00 per ton. To this price must be added the G. L. F. Agent-Buyer's handling charges.

SHRINES OF AMERICA

Bunker Hill

ONE night the American rebels, with spade and musket, quietly moved in and entrenched themselves on Bunker Hill. Next morning the British, surprised, attacked the hill with a superior force of soldiers and cannon from their ships in the bay. The Americans twice repulsed them and retreated the third time only after their ammunition gave out. The battle, a military victory for the British, was a moral victory for the Americans. It proved they could stand up against disciplined troops, face heavy fire and fight for their liberties. The monument above stands on Bunker Hill today to commemorate the battle. Below is Pain, or Trumbull's conception of the battle.

NITROGEN *makes* PLANTS and PROFITS GROW....

NITROGEN is as essential to crops as sunshine and rain. It's the fertilizer element that makes plants grow. That's why so many experiment stations and agricultural authorities say, "Use more nitrogen."

Experience and experiment have shown them that yields—and profits—generally depend upon the amount of nitrogen applied to the plants. A complete fertilizer containing 4% nitrogen produces better than one that contains only 3%...and a 6% nitrogen fertilizer is more profitable than either.

You can't afford to skimp on nitrogen—and thanks to the present low-cost of nitrogen, you don't need to. Use plenty of high-nitrogen complete fertilizer at planting time and when the young plants begin

to feed heavily top-dress or side-dress with Arcadian Sulphate of Ammonia.

Arcadian is rich in nitrogen—20.56% guaranteed, all soluble, all available. It is free-running and easy to apply. Low cost per unit of nitrogen makes Arcadian an exceptionally economical side- or top-dressing for any plant that needs nitrogen.

To be sure of your supply, order Arcadian Sulphate of Ammonia from your fertilizer dealer when you buy your high-nitrogen complete fertilizer.

Crop Grower

Increasing Tomato Yields

WHERE tomatoes are grown either for the canning factory or for market, it has been pretty definitely demonstrated that the profits depend almost entirely on a reasonable yield. There are, of course, a number of things which affect the yield of tomatoes. One of them is the time of setting. In most sections where tomatoes can be profitably grown, it is believed that they should be set at least by May 20th. A week's delay in a field setting may mean a large difference in the quantity of ripe fruit harvested, and particularly in the earliness of the crop which is especially important where the crop is sold on the market.

The second important factor is the soil fertility, which is commonly increased by the application of a commercial fertilizer. On fairly heavy soil a 4-12-4, a 4-16-4 or a 5-20-5 are often recommended in amounts of 600 to 700 lbs. per acre. On soils that are inclined to be a little lighter, a 5-10-5 or some fertilizer with a ratio of 1-2-1 is more commonly recommended.

In some cases better results have been secured by applying only a part of the fertilizer before the plants are set out, and to give a slight dressing of some readily available nitrogen carrier once or twice during the growing season. At the Geneva, N. Y. station, the application of about a teaspoonful per plant of a readily available nitrogen carrier just at the time most of the first blossom clusters had opened, increased the yield of marketable tomatoes nearly 2 tons an acre.

Cost of Producing Sweet Corn

Are there any figures on the actual cost of growing an acre of sweet corn as well as the probable profit from this crop?

AFTER studying this question on 35 farms, the New Jersey Agricultural Experiment Station concludes that it costs about \$73.00 to grow an acre of sweet corn. The average yield per acre was 3,766 ears, while the average for the five highest yields was 6,882 ears. The actual cost of producing the crop, including insurance, miscellaneous charges, labor, etc. was \$73.50 an acre. The average cost of growing 100 ears was \$1.95, and the average price for seed for 100 ears was \$2.13. At the same time some fields were able to produce corn at a cost of \$1.32 per 100 ears, while on other fields the cost was \$4.06 per 100 ears.

Early Planted Peas Yield Best

SOME experiments conducted by the Maryland College prove quite conclusively that early planting is important in getting a good crop of peas. Successive plantings were made at ten-day intervals, starting at the earliest possible dates. Figures were kept and the experiment was repeated for five years.

Invariably the later plantings matured in less time than the preceding one and almost without exception the earlier the crop was planted the greater was the yield. Those making the experiments concluded that the increasingly high temperatures encountered by the later plantings was responsible for the lower yield. At least the later plantings seem to give the poorer results in years when warm weather came early in the season.

Bulletin P 510, just published by the New York State College of Agriculture, gives some excellent information about raising onions on muck soil. This bulletin can be secured free of charge as long as the supply lasts, by writing to the Office of Publication, New York State College of Agriculture, Ithaca, N. Y.

Their Future Is Secure . .

THE family whose farm carries a Federal Land Bank mortgage faces the future with confidence. These folks know that so long as the semi-annual installments are met and the farm is maintained in good condition, the loan never will be called. They know that their installments, which include interest and a small amount on the loans, will discharge their debt in 20 or 30 odd years. Over 410,000 farm families now enjoy the security of Federal Land Bank mortgages. Such loans are back of

New York's Premier Potato Growers

Syracuse Host for Annual Sessions of Two Associations

By PAUL WORK

A. A. Vegetable Crop Editor

THE New York State Vegetable Growers' Association and The Empire State Potato Club held their annual meeting at the Hotel Syracuse, in Syracuse, on January 7 and 8.

The Empire State Potato Club had its beginning at Oswego four years ago and has grown into a husky and thriving youngster with a membership of 300, and with the active support of a vigorous group of growers. One of its great achievements, in addition to holding a splendid session each year, has been the carrying on of an annual contest to name the Premier Potato Growers of the state.

A change was made in the conduct of the contest this year in that it covers the entire potato acreage of the farmer, rather than a selected three-acre plot. This contest allows 50 points for cost of production per bushel of U. S. No. 1, 40 points for yields of U. S. No. 1 and 10 points for total yields. Oscar J. Alberding of Clayville received the solid gold medal with a score of 96.74, a cost of production of 42.8 cents, a U. S. No. 1 yield of 315 bushels per acre and a total yield of 342 bushels per acre. The names of the winners are given in the box on this page. Of these, Porter & Bonney, Geo. Schoen & Son, L. A. Toan, and L. W. Sheldon & Son have won this distinction in previous years. Mr. Alberding stood high among the winners in total yield and yield of U. S. No. 1, but Mr. Doran showed the lowest cost at 40.7 cents per bushel. The changed basis of the contest has doubtless resulted in higher cost figures than previous years and also somewhat lower yields. The cost range of the 26 contestants was \$.40 to \$1.74. The yield range was 76 to 372 bushels.

The New York State Vegetable Growers' Association celebrated the completion of twenty years of service, this being its twenty-first meet-

ing. The banquet was planned in special commemoration of the founding of the Association. After a brief historical review by Paul Work, Dean A. R. Mann of the New York State Col-

leges of Agriculture and Home Economics spoke on the progress which has been registered in the vegetable industry during these two decades.

He referred to an address which Dean L. H. Bailey delivered at the meeting of the Association in 1912 in which he called attention to the community of interest between vegetable growers and the rest of agriculture, emphasizing the desirability of closer contacts between the various rural industries. Dean Mann referred to the progress that has been made in realizing the objective suggested by Dean Bailey, and indicated that the progress of this association is of significance not only to vegetable growers but to all agriculture.

The regional market program of the state,

upon which H. E. Crouch of the State Department has been working for fifteen years, came in for full discussion during the session. Commissioner B. A. Pyrke spoke at the closing session, stating that this regional market program which has been most thoroughly studied and developed and is now ready to go forward, is retarded by a number of obstacles. Of these, the principal one is inertia, particularly in the produce trade. Producer and consumer when told of the possibilities of economy are likely to assume that these savings will be fully absorbed by the dealer, and hence they manifest little interest.

While the state has been many years in building the program it has thus far been unable to assemble a great enough weight of public opinion to render it effective. Two independent private groups have undertaken to establish great terminal markets in Buffalo with resulting confusion and a situation which is most unfortunate for the public and is not in the interest of any single group.

Henry Marquart, President of the Vegetable Growers' Association of America, a Master Farmer and a successful grower of Orchard Park, told in some detail of the situation at Buffalo, and M. P. Rasmussen of the College of Agriculture pointed out the needs for adequate terminals to make our wonderful highway system most fully useful for marketing purposes.

New Tomato Package Proposed

L. H. Gasper of Geneva, reporting for the committee on Grades and Packages, stated that our markets are no longer local. Inter-city trucking has built up an inter-locking system which calls for standardization as never before. His committee carefully considered the various

A Good Place to Live

How the Friendship Centralized School Builds Community Pride

LAST Fall we talked with a New York State Master Farmer who had just been elected a member of the Board of Education of a new centralized school district. He had been up on an average of about four nights a week until two o'clock in the morning, talking over plans for the new building and the new district.

A short time ago at a meeting of representatives of centralized school districts at Syracuse, Dr. Morrison of the State Education Department, asked how many districts were sorry that they had centralized. Not a hand went up. However, one man, with a grin, said to the man sitting beside him: "Sometimes I am a little sorry on school board meeting nights when we break up long after midnight. Otherwise, I am perfectly satisfied with the results."

For the Boys and Girls

Why are these two men and dozens of others, willing to give this time and at the same time accept the criticisms which inevitably come to everyone who is in a public position? We can see just one reason, namely that they are vitally interested in the welfare of every community and believe wholeheartedly that the new centralized district will be a distinct advantage to every boy and girl of school age.

One of the fine things that should come from a centralized school is a better understanding and a more friendly feeling between village people and farmers. We are glad to find that this is happening in many cases, yet we sometimes fear that all districts do not realize the possibilities for building up a community interest and spirit that will go a long way toward making their town an ideal place in which to live.

The following letter from Mr. Robert Witter, principal of the Fellowship Centralized High

School, will give you some idea of what we have in mind.—THE EDITORS.

* * *

Centralization a Gradual Development

PRIOR to centralization in 1925, all of the outlying districts with one exception had consolidated or were contracting with the Friendship district and transporting all of their pupils to the Friendship school. For this reason, the community was prepared to adopt the measure with little readjustment and with very little adverse criticism. Apparently, the majority of the rural people had decided that there were advantages to be gained by joining with the village school.

During the period that the outlying districts were sending their pupils to the Friendship school, the Board of Education of Friendship No. 1 had given equal consideration to the rural and town groups and attempted to cooperate with the rural communities. The Parent-Teacher Association established at this time is worthy of note in that the membership of the organization included many parents in the rural districts. This organization sponsored the hot lunch project which was established under the direction of the Homemaking Department, for the benefit of the rural pupils. Money was raised by membership dues and by various group activities to defray current expenses and vegetables were solicited from the community. Under this plan, no charge was made to the individual pupil. This project has continued and while the financing has been taken over by the Board of Education, the P-T-A still oversees the work and selects the woman in charge of the preparation of the lunch. Another project taken up by the P-T-A this year is the follow-up work of the medical examination. Whenever parents are unable to afford the neces-

sary medical attention, the P-T-A is planning to cooperate with the County Welfare Organization in providing funds to carry out the suggestions of the examiners. Interest in these and similar projects has brought the parents of the rural and village groups into closer contact thereby creating a friendly relationship in matters pertaining to the school.

A Kindergarten, Too

Perhaps one criticism of the rural people toward the central school plan both in Friendship and in other communities has been due to the long day for the younger pupils, especially those of the kindergarten age. In Friendship, we have had as many as twenty rural kindergarteners during one school year. Since these pupils have come from various districts, it has seemed impractical to provide transportation for them at noon when the regular kindergarten work for the day is over. To meet this condition, we have arranged for play periods and rest periods in the afternoon under the supervision of the kindergarten teacher. During the rest period, each pupil is provided with a blanket and pillow and allowed to take a nap. Many youngsters fall asleep and awaken refreshed and ready for the ride home. With this plan in operation, I believe that rural parents have felt that their children were as well cared for as at home.

The transportation arrangements have been handled by a committee of our Board consisting of one member from the village and one from the rural community. The member coming from the rural section is experienced in the work of transportation since he was the driver of the bus coming from his district for a number of years before the central plan was adopted. He is

Thought For the Week

ONE of the "songs that mother used to sing" was entitled, "You Never Miss the Water 'til the Well Runs Dry." One afternoon last week we recalled the moral of this song while on a train for Chicago, riding through the beautiful farm country of Lancaster County, Pennsylvania. It was just chore time on a clear, sunshiny, winter day, with the sun going down in all its glory. As we passed farm after farm with the smoke from the evening fires going straight up into the sky, we were a little homesick for old days and old times on the farm which can come no more.

It took little imagination when looking at those quiet farm homes to see the members of the family going about the homely farm tasks. We pictured father and the boys at the barn doing the night chores while the women folks prepare the evening meal, which, even in the hard times, is well described by the old farm expression, "good nuf what there is of it, and nuf of it such as it is." Then after supper on the farm comes a long evening about the fire, with reading or sewing or games, usually with apples to eat, popcorn once in a while, and an occasional neighbor dropping in for a friendly visit.

Why is it so hard for most of us to realize before it is too late that the greatest joys are the simple ones, founded on the associations of family and friendship ties? It's a world of changes and all too soon the wheel of time will bring new scenes and new faces. It never turns backward. In the irritating and worrying tasks of everyday life we take the present and those who are walking with us too much for granted. Soon the present becomes the past and we realize again the truth of the old song, "You Never Miss the Water 'til the Well Runs Dry."

Master Farmer Banquet at Farmers' Week

THE American Agriculturist Master Farmer banquet which has become one of the big farm events of the year will be held at the New York State College of Agriculture during Farmers' Week on Thursday evening, February 12th, at 6:30 P. M., at Willard Straight Hall. Governor Franklin D. Roosevelt as in past years, will confer personally the awards upon the Master Farmers of 1930. Other prominent leaders in agriculture will be present.

In addition to the Master Farmers, five boys and one girl will receive the 4-A Achievement Award presented by American Agriculturist for outstanding achievement in agriculture and citi-

zenship. Two of these young people will be from the Boy Scouts, two from vocational high schools, and one boy and one girl from 4-H Clubs. Names and addresses of Master Farmers and of those who will receive achievement awards were published in a recent number of American Agriculturist.

No special invitations will be issued this year to attend this great and impressive ceremony. One object of holding it during Farmers' Week is to give a large number of farmers a chance to see these awards personally conferred by the Governor on men who have made good in agriculture. The thought is to honor all agriculture as well as the Master Farmers themselves.

In order to help cover expenses, a charge of \$1.75 per ticket will be made for the Master Farmer dinner. The capacity of the hall is 325, and as there are always several thousand farm people in attendance during Farmers' Week, the demand for tickets is sure to be more than the supply. Therefore, to be fair, we have decided that "first come, first served"—that is, those who order the tickets first will be the ones who make certain of attending this notable affair. Reservations should be made immediately. Address the Editorial Department, American Agriculturist, 461 Fourth Avenue, New York City.

Seed Catalogs Are Here

JUST about the first sign of spring is the seed catalogs. Before us as we write there are several of these bright publications, good omens or promises for another seed time and harvest.

To be sure, the seed annuals sometimes seem to exaggerate. Never does it seem possible to grow such beautiful specimens of flowers, vegetables and crops as are pictured in these catalogs. Yet such specimens are grown, for the pictures are taken from actual photographs. And, anyway, these pictures and descriptions serve as ideals toward which strive every husbandman and every lover of things that grow.

Not before in many years is there more need of careful planning on the part of the gardener and farmer in order to buy the right seed and to grow the crops at the lowest possible cost. The work of growing is half done when quality seed is purchased. Time spent in studying catalogs, prices and seed quality is time well spent.

This Judge Treated Chicken Thieving As a Crime

N. M. FLAGG, our New Hampshire Editor, reported in our New England edition last time, the case of a thief whom the local judge sentenced to State's prison for not less than four years for stealing chickens. The man had already been in the hospital a month recovering from a wound administered by a shotgun in the hands of the owner of the chickens. We say, "Hurray for Judge Scammon of Exeter, N. H." who treated chicken thieving as a crime and not as a joke.

Many local magistrates and prosecution officers do not seem to realize what a serious problem chicken thieving has become in rural districts. It was once confined mostly to a few ne'er-do-well families living in the local neighborhood, but today, the stealing of poultry is an organized crime "racket". There are "fences" in every city who act as organized buyers and who are connected with regular gangs of chicken thieves who turn in the poultry. These "fences" dispose of poultry in the regular market and the proceeds are divided up with the thieves who made the original haul. The gangs are well organized with leaders, and with fast-traveling trucks so that they often clean up all of the poultry of several farmers in one night.

Unfortunately, when these thieves are caught, the judges often even let them get away entirely with suspended sentences, or give them light sentences like those that used to be imposed on chicken thieves years ago when the crime was not

a very serious one. Therefore, the organized gangs have little to fear.

The New Jersey State Poultry Association has adopted a resolution for stiffer sentences for convicted chicken thieves. The resolution states that poultry thieves when brought to trial often arouse public sentiment and sympathy in their behalf, so that the sentences imposed are not in keeping with the extent of the crime. Such criminals are deserving of no sympathy whatever, and we urge all public officials charged with enforcing the law, to do their duty. Stealing poultry is robbery and should be so regarded.

Is This Worth Saving?

I read in our Agriculturist this week your editorial against paying officials by fees. I agree with you, but if the taxes are paid directly to the County Treasurer, will not the office force be increased enough to make salaries more than the collector's fees?—I. I. P.

THIS is a reasonable question. It is plain, however, that one office is better than from ten to thirty. Some counties of the State have as many as thirty towns and as many collectors, not to mention many more school collectors.

It would be necessary to add a small amount of help to the County Treasurer's office in some counties but not enough to offset the savings by eliminating local collectors. A careful study of this tax collection system in New York State was made recently by Professor M. Slade Kendrick, an economist at the New York State College of Agriculture. He found that should the County Treasurer system of collecting taxes be substituted for town collectors it would save taxpayers of the State at least \$300,000 a year.

Real Sportsmen

WE must make the farmer feel that the sportsman is his friend, first and foremost; that the sportsman is at all times ready and willing to work for the landowner's interests in the way of desired legislation for the farmer's benefit and for his protection. HENRY M. NICHOLLS, President of the New York Conservation Association.

The above quotation is taken from a speech sent by Mr. Nicholls to Mr. Jay F. Hoover, formerly President of the Conservation Association to be read at a meeting of a local sportsmen's club held in Erie County. We repeat it here because it is an example of the real attitude of good sportsmen toward farmers. Men of this type never make any trouble when they are on a farmer's land as his guests. It is a small minority of sportsmen, who are not sportsmen in any true sense of the word, who cause the farmer worry and loss. Farmers and sportsmen should work this trespass problem out together.

Eastman's Chestnut

DOES it not irritate you and make you impatient to get on a train or in some public place where there is a mother with two or three small children, making life miserable for herself and everybody else by constant scolding?

Recently at a meeting of farm paper publishers in Chicago, someone was "kidding" Publisher Hoard of the fine, old, standard farm paper, Hoard's Dairyman, because he had his son with him, who is also one of the managers of the paper. It was suggested to Mr. Hoard that he would have to walk the "straight and narrow" on his visit to Chicago in order to set a good example for the younger Hoard. Whereupon he told the following story:

Once upon a time there was an old hen with 13 chickens, and they all went out into the wet grass. The old hen was worried and all day long she went, "Cluck, cluck, cluck; cluck cluck cluck." The more she clucked, the less attention the chickens paid. They ran anywhere they wanted and did just what they pleased, in spite of the old hen. But still she "cluck, cluck, clucked."

"Gentlemen," concluded Mr. Hoard, "my clucking days are over!"

When a Young Man Buys a Farm

A Master Farmer's Suggestions Based on Experience

EDITOR'S NOTE—Here is another one of those interesting stories written by a Master Farmer right out of his own experience. Never will we forget of going to visit Mr. Wright and of the story he told us about always wanting, since he was a little boy, to buy and live on a certain farm in his father's neighborhood. The farm was valuable and he had little or no money but he never forgot the idea and finally the dream came true.

No one is better able to write on the subject of a choice of farm for a young man than Mr. Wright.—E.R.E.

THERE is one subject that I feel is of great importance to a young man who is about to launch in the farming game, which I have never seen discussed very extensively in the old reliable A. A., that is, the importance of the location of the farm he is about to purchase. After my wife and I were married, which was twenty-seven years ago, we bought a farm of two hundred acres, four miles from town and over a big hill, the land lay with a gentle slope toward the south so nearly every acre could be worked with a tractor. This farm had been rented for some time, but I had very little trouble getting it to produce excellent crops of hay, grain and potatoes, but the longer we lived there, the more I thought of the hard jaunts to and from town which had to be made with horses, as automobiles had not yet come in use. The school was one mile distant. After a few years we had a girl and a boy who would soon be going to school. I often thought how much it would mean to them if they could be down on a good road nearer town. All this time we were getting our buildings in better repair; we had placed a pump in the kitchen so my wife could pump the water she used in the sink instead of going out to the well.

A Chance to Buy

I had persuaded a telephone company to build a line to the house after I furnished the poles for a half mile of line which was the distance we were from the through line. My next undertaking was to get a R.F.D. route started that would pass our farm. I was laughed at quite a bit for thinking of getting a mailman to undertake to climb that hill every day in the winter through the snow banks that were sure to come. But I got it and it has been functioning for nearly twenty-six years with comparatively few days skipped. These conditions made life much more pleasant, but all this time I felt that we were making a mistake in putting more money in this place. I had always had a great desire to own a farm in the town where I was born, located one-half mile from a village on a good road. Previous to this time this farm was not for sale. One day I was on a business trip past this place, the owner stopped me as I was passing and asked me to buy his farm.

We were not long in making a bargain. This farm had had a lot of stock kept on it for a number of years as the owner had other farms from which he had drawn the produce here to feed. We have lived on this farm for eighteen years and have spent several thousands of dollars for improvements. We expect to keep this place for our home, but if we should want to sell we could get a buyer at a good figure, while if we were on the hill farm, no matter how much we had spent for repairs, we would have had a difficult task to have found a buyer who would have paid near its value.

Many Good Valley Farms

We often hear the remark made, that all the farmers cannot live on the creek roads, but I am not so sure about that. There are a great many good creek farms lying idle in old Otsego County. There is a farm in our town that has just changed owners. This farm was purchased some fifteen years ago and the owner certainly did put it in ideal shape. He has been trying to sell it for some time but has failed to find a

buyer as it was located about two miles back on a hill. He has at last succeeded in trading it for village property with a real estate dealer. I do not know how much value he received for it, but I venture to say he would have received double the amount for the money and labor he had put in this place if he had used wisdom in selecting a good location when he bought. A young man may, in some instances, be justified in buying a good hill farm to get a start in farming.

Times have changed from what they were when there was a school house at every cross road and when one trip a week to town was all we had to make. Now with the milk to get down to the truck every morning and the children to get to and from the busses, my advice to a prospective farm purchaser is, look well to the location before you invest.—F. S. WRIGHT, Otsego County Master Farmer.

Another Story About the "Stone Mill"

ON your December 13th cover there is a most interesting picture of the Old Stone Mill at Newport, R. I.

May I as a Rhode Islander, born and raised, and until the year 1913, a resident of, present the Rhode Islander's version of this mill?

It would seem strange to me at least that the vikings would build a mill when they made no permanent settlement in North America.

The age of this old mill has long been a matter of dispute, among historians. The claim that it dates back to the Norseman is because of the fact that the architecture of its formation seems to resemble that of Scandinavian mills. There is much evidence that this mill was an old Colonial windmill, built by the great-grandfather of Benedict Arnold, the traitor. His name was also Benedict Arnold and he was a governor of Rhode Island for several terms. In his will, dated in the year 1677, there is the following:—

"My body I desire and appoint to be buried at ye Northeast corner of a parcel of ground containing three rods square being of and lying in my land

in or near ye line or path from my dwelling-house leading to my stone built windmill, in ye town of Newport, the middle or center of which three rods square of is and shall be ye tomb already erected over ye grave of my grand-child, Damaris Goulding, there buried on ye fourteenth day of August, 1677, and I desire that my dear and loving wife, Damaris Arnold, after her death, may be buried near unto me, on ye South side of ye place aforesaid ordered for my own interment, and I do order my executors to erect decent tombs over her grave and my grave in such convenient time as may be effectually accomplished." Scientists have confirmed the opinion that the mill was the property of this Benedict Arnold.

In Cooper's novel "Red Rover" this mill is the one to which reference is made, and in Longfellow's poem "The Skeleton in Armor", there we see the old mill's skeleton; this was encased in broken and corroded armor, and was dug up near the old mill. It is assumed that the verse

"There for my lady's bower,
Built I the lofty tower,
Which to this very hour
Stands looking seaward."

refers to the old mill.

—EDITH A. HARRISON, N. Y. State Historian for Gallatin, N. W.

Farm Boundary Lines

IN the early days of this country boundary lines between farms were usually marked, as many old deeds tell us, by a "stake and a stone" at the corners. For the man of to-day these landmarks have very little value. The stakes driven down seventy-five or a hundred years ago long since disappeared and in many instances the stone has sunken out of sight.

At one corner of our own farm, however, one of the ancient stones still remains. It is an almost square piece of rock, evidently taken from the bed of the creek nearby. The man that set it planted it deep in the earth, and there it has stood ever since, a val-

uable marker in determining the other lines of the farm.

This ought to be done on every farm. I have known of a good many lawsuits growing out of timber-cutting in pieces of woods where the boundary lines have been obliterated. In most cases of this kind the trespassing was not intentional; men believed they were cutting timber on their own premises and were surprised when the lines were accurately run and they found that they had invaded their neighbor's domain.

For this and other reasons it is the part of wisdom to have all boundaries clearly marked out by a new survey and definitely settled by good, sound stones or iron markers at every corner. This would save much litigation and hard feelings between neighbors.—E. L. V.

Land Bank Suggests Oil and Gas Lease

LAST fall we published a story telling of the leasing of farms in Central New York and Northern Pennsylvania for oil or gas. At that time we pointed out that, leases of different companies varied considerably in the provisions they contained and that some were more favorable to land owners than others.

Since that time we have learned that the Federal Land Bank of Springfield, Massachusetts, of which Mr. E. H. Thomson is president, has a suggested form for an oil and gas lease, which they are recommending to all persons who have borrowed money on mortgages from the Federal Land Bank. While this suggested lease is designed primarily for the use of borrowers from the Bank, we believe that other readers who are interested, will be able to secure a copy of it if they should address such a request to the Federal Land Bank.

There are several features of this lease which are especially interesting. In the first place, the lease provides for the payment to the land owner of one-eighth of all oil and gas produced on the leased premises. One of the common complaints from Central New York is that the lease provides for one-eighth the oil, but not for one-eighth of the gas. Some of our subscribers claim that they were led to believe that their farms were being leased to drill for oil, whereas as a matter of fact, they now believe the company planned to drill for gas rather than for oil.

Another provision in the lease provides that the company shall reimburse the land owner for all damages to crops, trees, and fences. Most leases, we understand, provide that the land owner shall have gas for his own use. This suggested lease specifies that the land owner is to have gas to an amount not exceeding 150,000 cubic feet a year. The lease also provides that forty acres shall be allowed for each well drilled and producing gas in marketable quantities, and that after two years, if no further wells are drilled, any acreage outside the forty acres shall be released from the lease. Four acres are allowed under similar terms for each well producing oil.

Another interesting feature is a provision to the effect that unless a well is drilled within a certain date, the entire lease becomes null and void. The rights of the company are not neglected either. The lease gives them the right of way across land, the right to transmit power and gas to and from the premises for operating purposes, and gives them the right to use water so long as it does not interfere with the farmstead water supply. The company also agrees to lay all pipes twelve inches in depth if requested to do so by the farm owner. If you are interested in having a copy of this suggested lease, drop a line to American Agriculturist, 461 Fourth Ave., New York City and we will forward your request to the Federal Land Bank.

The Song of the Lazy Farmer

MY NEIGHBOR says it isn't nice to make the cows root through the ice to get a drink, it cools them so it interferes with their milk flow. He says you can't make money if the cows are well-nigh frozen stiff, that water must be warmed some way; to heat it up with grain and hay costs money, it is cheaper far to give 'em water where they are. He's got a bowl beside each cow and ev'ry critter has learned how far inside it her nose must go before the water starts to flow. That water isn't cold at all, and them there critters can drink all they want, it doesn't cool their blood, but simply moistens up their cud. They drink a dozen times a day to soften up their grain and hay, it fills them up with pep and vim, they fill the pail up to the brim, and neighbor tells me that is how he gets a profit from each cow.

My neighbor's idee listens good, if I was younger why I would put drinking cups in my barn too to see what them there cows would do. But I'm too settled in my ways, and though that water system pays, it costs a lot to put it in. I guess it's too late to begin a-tryin' out new-fangled plans, besides, I'd have to buy new cans if my cows' milk flow should increase. I guess I'll leave them cows in peace a-drinkin' water through the ice, because I haven't got the price of drinking cups, and then I fear, it isn't honest to appear to water milk, there ain't no diff a-mixin' water in, or if you just dilute it through the cow, it's too much trouble anyhow. So I'll keep on the way I be, nor have to milk so much, by gee!

NEW IDEA Farm Equipment

Longer Service - with This Dependable Spreader

If you want to get all possible fertility value out of manure, spread it as fast as it is made. On many farms that means work for the spreader every day in the year. There is one spreader you can rely on to stand such a severe test. The NEW IDEA goes right along, summer and winter, over any kind of ground, with the same dependable freedom from trouble. Always doing a perfect job of spreading, light of draft and easy handling, the NEW IDEA gives a lifetime of steady service. And for spreading lime, place our Lime Spreading attachment on your NEW IDEA—it has never been excelled for the task.

Improved NEW IDEA Transplanter

DIFFERENT from all other planting machines. Thoroughly safe and comfortable for both driver and plant setters. No skilled labor required to operate. Handles ALL transplantable crops and root set-

tings, either in ridge or flat plantings or for cross-cultivation. Recommended by farmers, truck growers, nurserymen and florists. Produces better and earlier crops than the most careful hand setting. Saves tremendously on costs. A modern machine of wide utility.

Be sure to see the NEW IDEA All-Steel Harvest Wagon. The most useful wagon ever offered for all farm service.

See your NEW IDEA dealer or write us direct for complete information about any machine in our line.

THE NEW IDEA SPREADER COMPANY

Manufacturers of Spreaders, Corn Pickers, Transplanters, Husker-Shredders, All-Steel Harvest Wagons, Lime Spreaders, Portable and Bucket Elevators, Hand and Power Corn Shellers, Hay Loaders, Side Delivery Rakes, Gasoline Engines.

A.A.'s Western New York Farm and Home Talk

Safeguarding Your Interests

By M. C. BURRITT,
Public Service Commissioner

AS farmers, there are two sets or types of conditions which affect us and with which each must deal, viz., the soil and the physical conditions of our particular farms, and the neighborhood, town, county, and even

M. C. Burritt

state conditions and policies which affect these farms from without. With the first of these sets of conditions we can deal individually. They respond to the personal ability, energy and management put into them, within their limitations. The second set of conditions may be modified only in cooperation with others and chiefly through government activities and regulation. Included in this vitally important group are the highways and their improvement, public transportation facilities both of passengers and freight, and the availability of power and other public utility services.

Great progress has been made in the improvement of highways to serve the farms though much remains to be done to extend these to all economic farm units. The building of these improved highways has effected a revolution in transportation in the last twenty-five years in both private and public transportation of persons and products, beyond the realization of most of us who have lived through it. And it is by no means over yet. It may be that recent tendencies have gone too far already and that our transportation system is in danger.

The number of passengers carried by the railroads has been declining very rapidly during the last decade. On some entire railroads it is now less than half of what it has been. On certain branch lines the number of passengers has become almost negligible. This is, of course, due first to the private automobile and secondly, to competing omnibus lines. This situation has, of course, led to the discontinuance of trains, stations, and station agencies by the railroad companies and in many cases these can be justified, at least by the financial facts. So many complaints are received from American Agriculturist readers that it seems appropriate to discuss this matter here.

All transportation services within the state are by law under the supervision of the Public Service Commission. Such services must be suitable and adequate to meet the needs of the traveling public. No railroad company may discontinue a station agency or close a station without the permission of the Commission and this is not given until the company in a public hearing has publicly presented the facts and justified its application. At this hearing the public, who may be affected, may appear in opposition and should present any facts which they may have in opposition. All the testimony for and against is taken by a stenographer. This evidence is then

studied by the Commission representative who presides at the hearing and his report is presented to the Commission as a whole who then vote upon the question. Thus public interests are safeguarded. But those who are affected by a proposal must be alert to present their interests intelligently. If they do not the Commission may not have all the facts.

The State Department of Agriculture and Markets has persons available to help groups of farmers present their facts and cross examine company witnesses. Trains may be taken off by the companies at will as this is a matter of management, providing the service is not reduced below adequacy and there are no substantial complaints. If there are formal complaints, or if the Commission believes that the service remaining may not be adequate, formal hearings are set and the procedure is the same as in the case of station agencies proposed to be abandoned.

Similarly all bus services and fares within the state are subject to regulation and approval by the Public Service Commission. In addition, before a bus company may operate it must secure local franchises through the towns and villages through which it passes and these must then be approved by the Commission after formal public hearing. Generally such franchises are not approved when they are in direct competition with other bus lines or railroads except when these are inadequate and more or better service is clearly in the public interest.

The Commission has been liberal in approving new bus services—perhaps too much so—for many local bus lines without through traffic between large cities, are not now paying. And local train service has been reduced to a minimum. Because of the competition—especially of private cars—accentuated by the depression, it is probable that we may face further marked changes in our transportation system. It is, therefore, well that all understand the process of affecting changes that they may protect their interests. —Hilton, N. Y., January 11, 1931.

New York's Premier Potato Growers

(Continued from Page 3)

possible tomato packages. The Buffalo box, the lug box which is used for southern and western shipments, the climax or grape basket, the 3/4 bushel tub basket used around Albany, the Diamond market basket and the square woven splint basket. The committee favors the latter package because it displays the produce well, loads and stacks well, protects the content, is strong, may be easily covered and labeled, and is cheap. At the suggestion of this committee the association has asked the growers of the state to give this package a thorough trial for tomatoes and other appropriate crops during the coming season, with a view to its adoption as a state-wide standard at the next meeting.

The program of the two meetings included some fifty speakers and subjects and was attended by over four hundred growers. The potato, vegetable, trade and educational exhibits completely filled the ballroom.

Sixteen counties took part in the 4-H club potato show. The Empire State Potato Club has registered three hundred members thus far, and is vigorously pressing educational programs.

Resolutions Passed

The resolutions recommended the establishment of a muck land research farm in western New York to take over the investigational work which has been carried by fellowships and sponsored by local organizations. Increased federal appropriations to the Bureau of Plant Industry were recommended in order that studies on the quality of vegetables and on muck land problems may be inaugurated. A request was made that out-of-state judges be used in the Farm Produce Department at State Fair. The regional market plan of the State Department was indorsed as well as the movement for a standard local market basket. The legislature was asked to pass a state law carrying the provisions of the Perishable Agricultural Commodities Act which has recently gone into effect for inter-state movements. The askings of the grower committee which visited Cornell last March, and studied the needs for increased space and facilities for the Department of Vegetable Crops were supported. The Empire State Potato Club urged the passage of a state branding law, and support for research and education.

The Empire State Potato Club elected the following officers for 1931: Charles Riley, Sennett, President; L. A. Toan, Perry, Vice-President; George W. Lamb, Hubbardsville, Secretary-Treasurer; Grant Schoen, Pittsford, Director; E. V. Hardenburg, Ithaca, Director.

The New York State Vegetable Growers' Association elected the following officers for the coming year: T. Harvey Holmes, Albany, President; Albert Schillroth, Orchard Park, Past President; L. R. Gillard, Elba, Regional President; G. A. Janowski, Elmira, Regional Vice-President; George Cornwall, Valley Stream, Regional Vice-President; A. G. Allen, Waterville, Regional Vice-President; Howard Crandall, Ithaca, Sec'y-Treasurer; Paul Work, Ithaca, Executive Committee; George W. Lamb, Hubbardsville, Executive Committee; George W. West, Rochester, Executive Committee (1 yr. term).

EDITOR'S NOTE: Professor Work was too modest to mention it, but we learned from another source that the New York State Vegetable Growers' Association, at the annual banquet, presented him with a gold watch in appreciation of the leadership and service which he has rendered the Association. Joseph Bogner, of Utica, a charter member of the Association and a member continuously since the founding of the Association, made the presentation.

Not land but the cost of buying and maintaining trees is the orchardist's greatest expense. The young fruit grower can therefore better afford to invest in trees that will produce for 60 years rather than in "filler" trees that must be cut down in 18 or 25 years.

THE BAG

**WITHOUT A
BACKACHE**

**Natural Chilean Nitrate in the
NEW 100-LB. SACK**

HERE is good news for every man who farms ... Chilean Nitrate of Soda in 100-lb. bags. In addition to keeping its contents in better mechanical condition, the new 100-lb. bag makes your work easier.

You'll like natural Chilean Nitrate better in these new bags. It's easier to handle. With the new bag you'll have only 100 lbs. to lift at a time. No backaches. These small bags insure that you will receive a bag 100 lbs. full. Bags reach you in better condition, too.

Chilean Nitrate you know is the fertilizer that puts profit in your crop. For a hundred years it has been the leading nitrate nitrogen. It's natural—not synthetic. In addition to its nitrogen, Chilean Nitrate contains iodine, boron, magnesium and other rare elements. It is more than just nitrogen. It is Nitrogen PLUS,—the most effective all-round fertilizer material.

LOWEST PRICE!

Dealers have a new enthusiasm for Chilean Nitrate. They are ready to quote a new low price and to sell whatever quantity you need for under crop or top dressing purposes.

Prices are lower than at any time in the past 25 years. Now is the time to buy.

A scene on the Research Farm of Dr. Hess & Clark, Inc., Ashland, Ohio, showing part of the dairy herd in the foreground

WOULD YOU RATHER HAVE MORE COWS . . . or get more milk per cow?

Seventeen cows that received Dr. Hess Improved Stock Tonic did the same work as twenty-three cows that received no Tonic. They did this while on test at the Research Farm of Dr. Hess & Clark, Ashland, Ohio.

IN THE case cited above, all the cows were comparable in every way. Past records showed their breeding and production capacity to be similar. They all received the same grain mixture, hay out of the same mow, ran on the same pasture. Just the same, seventeen of these cows (the ones that received Dr. Hess Improved Stock Tonic) averaged 8744 pounds of milk in a year. The other twenty-three (they received no Tonic) averaged only 6177 pounds of milk.

Dr. Hess IMPROVED STOCK TONIC

a conditioner and mineral supplement

Dr. Hess Improved Stock Tonic kept the appetites of the seventeen on edge at all times. The \$16.20 worth more feed they ate in the year is proof of that. But after all it is not so much what a cow eats. It is what she is able to utilize that counts. Those seventeen cows were able to utilize a larger portion of that feed . . . turn it into milk . . . and profit.

You can get the same milk you are getting now from less cows by adding Dr. Hess Improved Stock Tonic to your ration . . . by giving them the benefit of its potassium iodide, calcium carbonate, calcium phosphate and other ingredients which are essential to milk production and which help to keep cows in the best of condition.

Economize this year by putting your herd on Dr. Hess Improved Stock Tonic. It will cost you only two cents per cow per day . . . add dollars to your monthly milk check. See your local Dr. Hess dealer, or write direct to Dr. Hess & Clark, Inc., Ashland, Ohio.

With the A. A.
DAIRYMAN

State Holstein Breeders Meet at Utica

THE New York State Holstein-Friesian Association held its annual meeting in Utica on January 7, under President C. H. Baldwin's leadership. Mr. Baldwin reviewed the work of the past four years stressing the work on the by-laws, the budget system, and a membership campaign. He advocated better group action on facing present problems. At the evening banquet Professor H. H. Wing gave an optimistic talk on the future of farming.

The association also presented Professor Wing with a handsome rug in token of their appreciation of his services to the breed and to dairying in general. Mr. Baldwin and Secretary Robens, with their advisory committees, are to be congratulated on the success of the meeting and of the progress the association is making.

A number of committees reported. The Association has aided calf club work and has contributed considerable money for it. This has resulted very favorably, not only in aiding boys and increasing interest among them, but to breeders themselves. Better bulls and a greater use of pure bred bulls was the subject of another report. It appears that at least 56 per cent of the herds that have been checked up are using grade herd sires.

Advanced registry records were discussed by H. W. Norton who is in charge. He traced the improvement of the breed since tests have been instituted. Herds in the usual routine of milk production are making 300 pounds as an average. More testing should be done and more of the poor producers should have registry papers cancelled, was the conclusion reached.

Discuss Standardization

Whether standardization of milk is advisable or not was discussed somewhat at length. There are pretty strong advocates on both sides of the question. To add cream to bring up the fat content to a point that is satisfactory to the consumer would seem to be without objection, but those in charge of the adulteration of milk see difficulties in the administration of such a law under the changes proposed.

The name of Dr. S. M. Babcock came up in a report made by Professor Wing. The Babcock farm in Bridgewater is not much in use now and the house there where Mr. Babcock was born some 88 years ago needs repair. Since the Babcock milk test has been of so much value to the world, it would be fitting that the state be asked to provide in part, at least, for the purchase of this place and to fit it up as a memorial.

Take Action Against Palm Oil

The State Fair grounds are still in the process of development although Commissioner Norgord thinks there is now no state that has their equal. Mr. Brockway, architect, presented a chart of drawings that show what it is proposed to do. Among others, there is proposed a plan for a building for the Holstein breed of cattle as well as for others.

The convention took a strong position with the State Farm Bureau Federation relative to the use of palm oil in oleo. Since palm oil colors oleo to look like butter, it is held by these organizations that it should pay a ten cent tax. The ruling of the revenue department is that only the fraction of a cent of tax is required. A hearing has been granted on this point for a near date and the State Federation will present opinions and resolutions.

It was held that Holstein milk is especially valuable on account of its superior food value. Holstein milk is more easily digestible, said a report, and therefore, it should be advertised in that way. It was suggested that more publicity ought to be given to the value of Holstein milk for family use, including its use for infants.

Keeping stables germ-free is easy *with* Socony Disinfectant

LET Socony Disinfectant keep your stables healthy this winter. Many New York and New England farmers have found that this concentrated coal-tar product, with more than twice the strength of pure carbolic acid, quickly kills disease-producing germs and disagreeable odors.

They have found also that the following Socony products will keep their farm equipment in good shape during the winter months:

Socony Lubricote (*Household Oil*), made for all purposes for which a light oil is required. It is useful for preventing rust as well as for lubricating machinery.

Prairie Harvester Oil, especially adapted for use where a heavy oil is made necessary by loose bearings. It contains no injurious acids, is slightly affected by temperature changes, and reduces friction to a minimum.

Socony Turex Oil, made to lubricate Diesel and other internal combustion engines, for the circulat-

ing systems of turbines, and for special lubrication of all machinery where a truly high-grade, long-life lubricating oil is essential.

We also make many more products for use on the farm. How many of these are serving you?

Mica Axle Grease . . . Eureka Harness Oil . . . Standard Hand Separator Oil . . . Socony-990A Motor Oil for Model A Fords . . . Dendrol Dormant Spray Oil . . . Socony Banner Gasoline and Socony Special Gasoline *plus* Ethyl.

Many dairy farmers in New York and New England—like this one—know that their stables are disease free and sanitary because they use Socony Disinfectant.

PETROLEUM PRODUCTS FOR THE FARM

STANDARD OIL COMPANY OF NEW YORK

Reviewing the Latest Eastern Markets

Milk Prices January Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		1.70
2A Fluid Cream	1.86	
2B Cond. Milk		
Soft Cheese	2.11	
Evap. Cond. Milk Powder		
Hard Cheese	1.80	1.60
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for December 1929 was \$3.42 for 3.5% milk and Sheffield's \$3.22 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

December Prices Announced

The Dairymen's League announces the following pool prices for December for 3.5% milk.

Gross	\$2.20
Expenses	.06
Net Pool	2.14
Certificates of Indebtedness	.10
Net Cash Price to Farmers	2.04

	Net Cash	Net Pool
November 1929	\$2.59	\$2.74
November 1928	2.94	3.04
November 1927	2.89	2.99
November 1926	2.70	2.80

The Sheffield Producers announce the cash price to producers for 3% milk in the 201-210 mile zone, as \$2.55 per hundred, (2.75 for 3.5% milk).

	3%	3.5%
November 1929	\$2.72	\$2.92
November 1928	2.95	3.15
November 1927	3.00	3.20
November 1926	2.75	2.95

Butter Closes Firm

CREAMERY SALTED	Jan. 16, 1931	Jan. 9, 1931	Jan. 17, 1930
Higher than extra	29 -29 1/2	29 -29 1/2	36 1/2-37
Extra (92 sc.)	28 1/2-	28 1/2-	36 -
84-91 score	25 -28 1/4	25 -28 1/4	29 -35 1/2
Lower Grades	24 -24 1/4	24 -24 1/4	27 -28 1/2

The week ending January 17 found the butter market closing with a very firm tone. Offerings of fine butter are limited. This condition is considered more or less temporary but at the moment it gives the market a very firm tone. This is much in contrast to the market at mid-week. On Wednesday, January 14, accumulations had piled up following very quiet movement and lack of clearance of fancy butter. Values were forced down to 27 1/2c for 92 score butter. The decline came as a surprise and it unsettled the market. Receivers did not offer their goods freely at these lower prices expecting a recovery, which soon developed. Chicago reported improved conditions and price recoveries that carried the mid-West market above a parity with New York. Thursday found the market showing added firmness with considerable speculative interest in evidence, which gives some idea of the confidence that permeates the market.

The Government report for January 1 showed that the U. S. storage stocks totaled 63,349,000 pounds compared with 81,935,000 pounds at the same time a year ago. During the month of December 1930, U. S. storage stocks were reduced 24,663,000 pounds, whereas during the same period the year previous holdings were reduced 29,715,000 pounds. The trade did not like these last figures. They were food for the bears.

Better Tone in Cheese Market

STATE FLATS	Jan. 16, 1931	Jan. 9, 1931	Jan. 17, 1930
Fresh Fancy	18-19	18-19	17 1/2-18
Fresh Average			
Held Fancy			24 -26
Held Average			23 -

Although cheese prices do not show any change in comparison with last week the latter part of this week ending January 17 finds the market experiencing better trading. The Wisconsin market has been steadier since the 14th and trading has been a little more active on fine quality cured cheese. There is not a great deal of new business in fresh cheese but the undertone appears better. Short held goods are still bringing from 21 1/2c to 22 1/2c.

The U. S. Government report for January 1 states that the storage stocks in the country at the turn of the year totaled 63,362,000 pounds, whereas a year ago the holdings totaled 63,478,000 pounds. During the month of December 1930 the out of storage movement totaled 7,770,000

pounds, whereas during the same month the year previous storage holdings were reduced 7,587,000 pounds. Cheese appears to be holding its own.

Eggs Suffer Another Bad Break

NEARBY WHITE	Jan. 16, 1931	Jan. 9, 1931	Jan. 17, 1930
Hennery	27 1/2-28 1/2	32 -34	45 1/2-46 1/2
Selected Extras	27 -	31 -31 1/2	44 1/2-45
Average Extras	26 -26 1/2	30 -30 1/2	43 1/2-44

Firsts			

Undergrades	26 1/2-
Pullets	
Pewees	

NEARBY BROWNS	
Hennery	27 1/2-29
Gathered	24 -26 1/2

The egg market is indeed suffering an abundance of grief this year and the last week has been no exception. Heavy receipts of fresh mixed colors from the mid-West have been rolling in, with receivers showing no willingness to let stock accumulate in spite of reports of low temperatures in the producing areas. Eggs are also arriving freely from the Pacific Coast, as well as all Eastern producing sections.

The egg market is in the worst position it has been in for years. This is reflected in the cold storage reports as well as in the current price situation. The January 1, U. S. Government report states that at the turn of the year, the holdings throughout the country totaled 1,891,000 cases of eggs, whereas at the same time a year ago holdings totaled only 704,000 cases of eggs. During the month of December 1930 holdings were reduced 2,263,000 cases whereas during the same period a year ago holdings were reduced 1,927,000 cases.

The Government report of the frozen egg market tells a world of worry. Not only are our holdings greatly in excess of those a year ago but the cold storage reductions are considerably less than those of last year. On January 1, U. S. storage stocks totaled 83,148,000 pounds whereas a year ago holdings totaled 53,644,000 pounds. During December 1930 holdings were reduced 6,423,000 pounds, whereas during December 1929 holdings of frozen eggs were reduced 8,128,000 pounds.

Live Poultry Dragg

	Jan. 16, 1931	Jan. 9, 1931	Jan. 17, 1930
FOWLS			
Colored	22-24	-28	31-32
Leghorn	15-20	19-23	29-30
CHICKENS			
Colored	20-27	22-26	27-30
Leghorn	18-19	20-22	24-26
BROILERS			
Colored	35-37	38-42	25-34
Leghorn	30-35	35-40	24-26
OLD ROOSTERS	-13	-15	-18
CAPONS	32-35	40-42	37-40
TURKEYS	35-40	35-40	25-30
DUCKS, Nearby	25-28	26-32	-23
GESE	20-21	-22	21-22

With only one or two exceptions the live poultry market is considerably off color. Fowls have been forced out in order to make clearances, concessions being offered freely at the terminals. Fancy Leghorns were the only lines selling well. The rest of the fowl market is absolutely in the hands of the buyers. Pullets and fancy chickens have been selling well, but have been held back by the unsatisfactory market on fowls. Broilers, ducks and geese are also lower. Fancy nearby turkeys and fancy chickens and pullets are the only lines that have held their own or gone ahead.

Potato Market Quiet

The potato market has been quiet of late and prices are no more than just steady. Maines in 150 pound sacks have been bringing from \$3 to \$3.25, with Long Islands covering about the same range although a few extra choice bring \$3.35. Bulk goods per 180 pounds from Maine sell at \$3.30 to \$3.75, while Long Islands bring \$3.75 to \$4. Florida potatoes coming in show poor quality. Southern shippers are suffering a headache at present prices.

Hay Higher

As we expected last week the hay market advanced under short supplies and active trading. The situation has become so strong that there is now no differential between the price on large and small bales of similar grade. The strong market continues and there is nothing to indicate a change in the trend. Straw is also in more limited supply and prices are higher, although stocks are not moving as freely as hay. Straight timothy prices range from \$25 to \$30, with mixtures ranging from \$21 to \$27. Sample hay brings \$19 to \$20. Oat straw has advanced

to \$12 to \$13 while rye and wheat straw are quoted at \$14.

Meats and Livestock

CATTLE—Steers moderately active, steady. Two loads good \$9.60-10.25. Load medium grades \$8.60. Few lots cows steady. Common to medium \$4.00-5.25. Low Cutters and cutters \$2.00-3.50.

VEALERS—Vealers scarce, steady. Small lot choice nearby vealers \$13.50, few mediums \$7.00.

HOGS—Steady. Few medium grades 180 lbs.-220 lbs. \$8.00-8.50.

COUNTRY DRESSED CALVES—Receipts moderate all the week. Demand slow all through. Market closed weak and not cleaning up. Fresh receipts per pound: Choice 14c; fair to good 12-13c; small to medium 10-12c.

HOTHOUSE LAMBS—Receipts light all the week. Demand slow and for fancy only. Market steady. Good to fancy, each \$7.00-11.00; imitations, each \$3.00-6.00.

RABBITS—Receipts moderate during the week. Demand slow and carryovers daily. Market closed weak at 12-20c.

Farm News from New York

St. Lawrence Power Development Commission Makes Report

DURING the spring of 1930, a law was passed at Albany, authorizing the appointment of a Commission, to be known as The St. Lawrence Power Development Commission. The men named on the Commission were: Robert M. Haig, chairman; Julius Henry Cohen, vice-chairman and counsel, and Thomas F. Conway, Frederick M. Davenport, and Samuel L. Fuller, commissioners. Since that time this Commission has been studying the feasibility of a state owned dam on the St. Lawrence River, as well as state owned transmission lines.

The Commission has just made its report; in fact, has made two reports. So far as the dam itself is concerned, the Commission says that it is entirely practicable from an engineering point of view to construct a dam on the St. Lawrence River and to generate power without interfering with navigation. Such a dam and power plant will, it is claimed, produce power at a cost which makes the project a sound one from an economic point of view. The Power Development Commission recommends the immediate establishment of a public power authority and suggests that this body should negotiate with proper Canadian authorities and with the private company to be selected for the task of distributing electric energy generated by the \$171,547,000 project.

The Marketing Board of the Power Development Commission, in submitting a separate report, advises against state

owned transmission lines as being economically disadvantageous and proposes marketing of the power generated through existing utility interests. Inasmuch as the Niagara-Hudson Power Company is virtually the only large power company in Northern New York, it will be generally assumed that this would be the existing utility interest which would transmit the power.

Governor Roosevelt is far from pleased with this recommendation. It is reported that inasmuch as he believes the water power to be a natural resource which should be developed for the benefit of all the people, that more consideration should be given to the interests of the small consumer. The Governor also suggests that the recommendation that existing utility interests transmit power, may be based on the assumption that the state would charge rates which would return the same profits now enjoyed by power companies. As a matter of fact, under a state owned transmission system, rates might be lower than those now charged.

Regardless of his theories, it was said, the Governor felt that, since the Niagara Hudson Power Company was virtually the only company in Northern New York in a position to dispose of the state power, the report would place the state at a disadvantage in bargaining.

The Marketing Board further recommends that an attempt be made to interest industries using electric power to

locate near the dam. The power plant when completed, it is estimated, will produce about two million horse power, an amount approximately equal to all the electricity now being developed in New York State. The Board feels that because of the regular flow of the St. Lawrence River which will make it possible to generate the same amount of power twenty-four hours a day, an attempt should be made to market the power in such a way that as near as possible the same amount of power will be sold and used over the entire twenty-four hour period.

Dutchess County Has Farm Bureau Farm Electrification School

AMONG the 1,000 farm owners enrolled in the Farm Bureau of Dutchess County, N. Y., dairymen, poultrymen, and fruit growers in large numbers, during the past two years, have inquired of their Farm Bureau Agent about electric saving devices including the ways and means of construction and installation in both dwelling house and the farm buildings generally.

The Board of Directors of the Dutchess County Farm Bureau recognized the amount of interest among its membership and included in its winter program among other types of winter meetings a farm electric school. This farm electric school was held in Poughkeepsie Grange Hall on December 18th and 19th, 1930 with a representative attendance from all parts of the County of Dutchess. This was the first farm electric school to be held in New York State by a County Farm Bureau. It was sponsored by the Farm Bureau with the New York State College of Agriculture cooperating.

The school or institute, as it may be called, was a 2-day affair with morning and afternoon sessions and a lunch at noon each day served by the ladies of Poughkeepsie Grange.

The program arranged by the local

Farm Bureau is indicative of the variety of subjects covered and also it calls attention to the many varied uses to which Dutchess County farmers are now putting electric current. This one form of energy is used on farms for cooling, heating, sterilizing, pumping, grinding, lifting, milking, lighting, automatic controlling and innumerable purposes.

Oneida County Cow Wins Medal for High Production

ELISTA'S GOLDEN FERN, 3D, a purebred Jersey cow owned by Roy I. Bielby, of Rome, N. Y., has completed her third test as an eight-year old and produced 719.41 pounds of butterfat and 13,661 pounds of milk in 305 days, winning an American Jersey Cattle Club Gold Medal.

As a senior 3-year old she won a medal of merit and a silver medal. In another test she made 1009.35 pounds of butterfat and 18908 pounds of milk and received a medal of merit.

Mr. Bielby owns an excellent purebred Jersey herd and has carried on production testing for some time. At the New York State Fair in 1930 Elista's Golden Fern 3d took the blue ribbon in the Jersey Class for Register of Merit cows bred and owned in New York State.

Speeding Up to Help Unemployment

GOVERNOR ROOSEVELT has recommended to the Legislature that a portion of certain appropriations for Gipsy Moth control and the operation of forest nurseries be made immediately available wherever work can be done to good advantage during the winter, and provide work for the unemployed.

The appropriations requested are not in (Please turn to page 17 for additional New York Farm News)

New York County Notes

WASHINGTON COUNTY—Some are disposing of their wool at 20c per lb. Good lambs are 6c. Everything is low except the taxes. The roads are now covered with snow and ice which makes auto driving dangerous. Eggs are bringing 30c and 35c per dozen. No market for potatoes or apples. Cows are selling slowly due to the drop in price of milk and milk products.—H. C. C.

FRANKLIN COUNTY—The first real heavy snow of this winter is here. From 12 to 18 inches of snow fell in this storm, driven by an east wind and drifted many roads full. Only one road was open out of Malone after the storm. Busses and trains were tied up, or their schedules spoiled completely. Some farmers have already put up their ice for summer. Wood cutting is in full swing. A number of farmers have gone with teams to the "big woods" to haul pulpwood. This is a way of bringing in quite an extra revenue during otherwise dull months. Prices on grain, feed, eggs, flour, in fact nearly everything are lowest in years. Market prices at Malone; pea beans \$2.50-\$2.75, butter 30c, strictly fresh eggs 28c-30c, dressed pork 16c-18c, Western beef dressed 10c-15c, native beef dressed 7c-9c, veal 16c-17c, live fowl 18c-22c, dressed fowl 28c-32c, potatoes 50c, oats 45c, baled hay \$16-\$19, baled straw \$12-\$13. There is a great deal of unemployment all over the county. The heavy fall of snow relieved the strain for a few days as it created a need for labor. There is considerable sickness, no epidemics but simply a great many cases of colds, pneumonia, etc.—M. R.

GENESEE COUNTY—William Hamilton of Pembroke, who is also president of the Genesee County Dairymen's League was elected president of the Farm Bureau executive committee for 1931; Vice-President, Earnest Wilker, Darien; Secretary and Treasurer, Gilbert Prole, Stafford. The Farm Bureau now has 693 members.

A group of 320 Genesee County 4-H Club members including their parents and guests gathered for a banquet at St. Anthony's Community Center. John Sumner of Corfu was general chairman of the banquet committee. Chairmen were: Ramona Kell, Helen Woeller, Leslie Lamb. A dinner of 4-H baby beef and vegetables grown by the 4-H members was served by the home making girls under the supervision of Miss Erna Linderman. A musical program was carried out and a moving picture "In His Father's Footsteps" was presented by C. O. Bennet.

There is a move being made to centralize schools through here which, if passed, should result in better education for the rural scholar. No country teacher

with from 15 to 20 pupils of all sizes and grades can give them all the proper attention they need. Neither can a scholar concentrate on his lessons with the commotion of classes around him.—Mrs. R.E.G.

ORANGE COUNTY—The Middletown Business Men's Club recently entertained fifty farmers as their guests at the monthly banquet held at the Mitchell Inn. Mr. Merritt, of the Federal Farm Board, was the guest speaker of the evening.

The Orange County 4-H Club recently took its place before the "mike" at station WGY for fifteen minutes under the guidance of the county agent, G. D. Musser who introduced the speakers, Miss Eleanor Gutowski and Isadore Demarest.

Harry C. Schutt, owner of Bellevernon Farm, near Mechanicstown, has made some fine records in his first year of advanced register testing. The first cow to finish, Janet of Lodgmere has completed a record of 15,009 pounds of milk and 787.5 pounds of fat. Premier Ruth May made 15,204.7 pounds of milk and 600.7 pounds of fat. Mr. Schutt has two more cows on test that are expected to finish with records well over 15,000 pounds of milk and 800 pounds of fat.—R. H.

CATTARAUGUS COUNTY—At the organization meeting of directors of the Farm and Home Bureaus, held the second week of January, the following officers were chosen for 1931: President, John F. Crowley, Ellicottville; vice-president, Mrs. F. B. Nix, Ischua; 2nd vice-president, Fayette E. Rogers, Mansfield; 3rd vice-president, Mrs. John G. Miller, Salamanca; Secretary, Mrs. Charles C. Groff; Financial secretary, Treasurer, Anthony Covert, Randolph. Mrs. Nix, Miss Caroline Pringle, agent, and Miss Ruth Wilson, assistant of the Home Bureau will represent the county at Farm and Home Week in Ithaca, February 9-14.

Olean Grange in Olean, which will be host to the coming state session, February 2-6, have appointed the following committee on arrangements: Edward Devlin, general chairman; Edward Fitzgerald, secretary of the Chamber of Commerce, secretary; Mark J. Hannor, treasurer; Captain Van A. Simmons in charge of auditorium and state armory where sessions will be held. He is to be assisted by Charles Miller and Fred Heberle. Committees on reception and entertainment are yet to be selected. It is the second time Olean and Cattaraugus County have been hosts to the state grange. The first session in the county was when the late Frank Godfrey was State Steward. He later became State Master.—M. M. S.

LIME SULPHUR SOLUTION

GROW "FANCY" FRUIT. Your early spring sprayings can save you lots of trouble later, if you do a thorough job at just the right time. You can safely put the responsibility on ORCHARD BRAND Materials—whose potency is recognized by the big and successful growers from Maine to California. You'll save many dollars in labor by following the suggestions in "Cash Crops" regarding combination sprayings.

KERR BABY CHICKS ARE BRED TO LAY

THE 3000 birds on our breeding farm are descended from hens with large official records in the egg-laying contests. Part of them are also trap-nested under the rules of the New Jersey Record of Performance. The egg-laying qualities of Kerr chicks from this ancestry are firmly fixed.

In 1929-30 competitions, Kerr White Leghorns made records up to 304 eggs in 365 days. Kerr Barred Rocks, 257 eggs in 51 weeks. Kerr R. I. Reds made records up to 273 eggs in 51 weeks.

The baby chicks you buy from Kerr Chickeries carry the same blood lines as do these contest winners. BRED to lay—available from stock tested for B. W. D., which is the best insurance for livability.

Write for the Kerr Chick Book and prices.

With the A. A. POULTRY FARMER

Shipping Eggs by Parcel Post

I HAVE had a limited, but satisfactory, experience in shipping eggs by parcel post within the first and second zones, but there is no reason why, if one so desired, an extensive trade could not be built up.

Quality is of first importance. Eggs should be fresh, clean, large, of uniform shape, size and color and should be candled for inside imperfections. Not just the first few shipments but every shipment. Inferior eggs will have to be disposed of elsewhere.

Packing comes second. Eggs should be packed in corrugated non-returnable containers. This is important as customers emphatically do not like to return crates, nor handle soiled fillers. It may seem costly at first thought, but figured over a period of months it is cheaper and far more convenient and sanitary. Reckon a return crate as worth 45 cents. It will stand three or four trips, with repairing in between, as clerks are not careful with "empties." And the customer has the bother of returning and paying postage. On the other hand, fiber cartons, non-returnable, sold in 3-6-9-12 dozen sizes, can be purchased cheaply in large lots (about 11 cents according to size). They are safe, clean, light and always ready—no broken cases to repair and no soiled fillers to clean at the last minute and the eggs do not have to be wrapped separately in paper if the best types are used. These containers should be securely fastened with gummed paper tape and, as a further precaution tied with a stout cord. A handle attached to this cord on the larger packages will make handling easier and prevent breakage. "Eggs" should be printed in large black letters on the top. Large gummed stickers with plainly printed addresses are best. A permit can be obtained to inclose a bill in carton.

Customer Always Right

Courtesy is also important. A good slogan to adopt is—"The customer is always right." If a customer presumes on this courtesy drop him. There is rarely breakage if the above precautions are taken and it is easier to drop a customer than to get a new one so it is better to guarantee perfect delivery and stand firmly back of this guarantee in order to build up confidence. Don't quibble over claims. If sure they are unjust, pay just the same but drop the customer.

Concerning bills—by far the most satisfactory method is to have check accompany order. This saves expense and annoyance. Certainly it would be poor business to ship a stranger another order before the first was paid for.

When advertising we have found that stating the price saves correspondence and expense. However, make the price final for that time—do not tack on a few cents for anything. Price should include all the overhead but care should be taken to keep it as low as possible. Insurance, postage, cost of containers plus the profit over local prices to pay for extra trouble. It has been my experience that customers are willing to pay a good price for high quality eggs yet at the same time an average price is more satisfactory than an extremely high one when eggs are scarce. It is better in the spring, when eggs are cheap, to add a few cents extra and not demand quite so much profit when they are high.—MRS. L. M. C., Mass.

Trains Chicks and Husband, Too

A POULTRY woman who has been taking a correspondence course from the New York State College of Agriculture, reported that her chief difficulty was not to understand the lessons and put them into practice, but rather to train her husband to follow them. We are glad to report that she was successful in spite of difficulties, succeeding in raising a flock of 200 chicks with a loss of only six.

Our 260-egg trap-nested strain is famous throughout the country for its large size, high production and vigor.

Redbird Farm is the largest known S. C. R. I. Red Breeding Plant in the World

Every one of our 11,000 breeders is government tested for Bacillary White Diarrhea. You cannot go wrong when you buy our DISEASE-FREE chicks.

BROOD STRONGER CHICKS *electrically*

...for only 3c a chick

ELECTRIC BROODING not only means less out-of-pocket expense, but also produces chicks that are healthier and stronger. They grow faster, feather earlier and have a lower mortality.

The electric brooder simply warms the clean, cool air, keeping a constant temperature under the hover. It gives off no harmful fumes, leaves no ashes, eliminates fire hazard and decreases labor tremendously.

Repeated tests at experimental stations and on practical poultry farms show an average operating cost of only \$3.90 for a brood of 200 chicks. Less than 3c will raise a chick from the time it's a day old.

*Rural Service Division
to help farmers*

To help farmers take advantage of low-cost electricity, Niagara Hudson maintains a Rural Service Division of real farm people who know how to talk horse sense. One of them can be reached at your nearest Niagara Hudson System office. His help and advice are free... ask him about our plan for financing the purchase of electrical equipment.

Aunt Janet's Corner

A Barren, Bleak Land Makes Health Problems

LAST night I listened to the story of a woman who had spent a summer on the bleak coast of Labrador studying how the people of that cold clime can have an adequate diet throughout the year. She accompanied her talk with lantern slides made from pictures she herself had taken. Supplies for the ten months of winter have to be laid up, for communication stops completely and there is no way to get more. In fact, it is fairly common for a family to get "down to bread and tea" before the way opens to get more. As a consequence, there has been rickets among the children and there is beri-beri, a disease due to a diet which is not well-balanced.

The efforts of this nutrition worker and her assistant were chiefly concentrated on getting the natives to plant gardens, and last summer a trunk half full of seeds were sent up, together with garden tools to be loaned out. There was always a waiting line for the tools and this winter, there were more vegetables to be stored. But with only a two month's growing period, and with the destructive dogs and uncertain weather to cope with, growing gardens is not easy. Furthermore, a fisherman is not easily made into a farmer.

The point of my story is that the difference between sickness and health depends upon their food supply, the chief lack with them being fruit and vegetables. Here in our land of great variety, we can have the fruit and vegetables, but too often we don't. We have colds, we continue to stuff ourselves on sausage and pancakes and other rich, concentrated foods. We make poor conditions for ourselves when really nature is very, very kind. The need for study of diet is not limited to Labrador, by any means. The main difference is that here we can easily correct our dietary deficiencies if we will, while there it means revising almost their entire economic structure.—AUNT JANET.

home). Toy suit cases filled with tiny mints were favors, and over the table hung an airship from which a basket was suspended. Two ribbons led from this basket to the place of the honoree. After dessert had been served, the guest of honor was directed to pull on the ribbons, and a shower of pretty handkerchiefs fell upon the table—farewell gifts!—E.D.Y.

Tested Recipes

Lentil Soup

Put one cupful of lentils into two quarts of water and let soak over night. In the morning add one diced potato, one onion cut fine and one diced carrot and a tablespoonful of rice, one tablespoonful of butter, salt and pepper to taste. Boil about three hours.

—MRS. R. C. DL.

As in other legume soups the fried salt pork or bacon or the fat from either would help the flavor.

Spaghetti Bouillon

One box of spaghetti, two pounds of beef to boil, two stalks of celery cut fine, two onions sliced, two dried carrots, season with parsley, salt and pepper to taste. Wash and cover meat with cold water; after it is partly cooked add the vegetables and seasoning. Cook until thoroughly done. Remove meat and strain out the vegetables. Place over the fire, add the spaghetti and cook thirty minutes very slowly, stirring so as not to allow the spaghetti to settle.—MRS. R. C. DL.

Beef which has been used for making bouillon is perfectly good for meat cakes or meat in white sauce. It must be remembered, however, that such meat is lacking in flavor and needs plenty of seasoning.

A Novel Shower

MILDRED was leaving to make her home in a distant town, so the girls gathered together to give her a farewell party. The luncheon table was decorated in a pleasing and novel way. A toy railroad track (borrowed from a small brother) ran the length of the table and at intervals were tiny candles burning representing the main stations from Ridgeway to Porterville, (her new

Drainboards on both sides of the sink make dishwashing easier and save the breakage likely to follow when there is nowhere but the sink to put the soiled dishes.

The percolator which has become stained inside with coffee may be cleaned by filling the pot nearly full of boiling water and adding a teaspoon of soda. Let it boil a few minutes and then wash it out with soap and water.

For the Bathroom

For the bathroom the lily pad rug as it comes to you is a packet of color-fast materials in plain and tiny check green tones, lining, inner padding, tape, floss, large appliques and bias binding, together with instructions for making. The size is 36 by 22 inches and the stitching which goes through all four thicknesses makes it firmly secure. A charming and practical little mat easy both to make and to launder. It is number M665M for all materials. A round stool top to match, cut about 15 inches in diameter, all materials included is number M665S.

Something quite new again is the toilet seat cover; it muffles a falling lid, makes a seat available while dressing, and is smart and ornamental. All materials and floss complete may be ordered

as number M665T. Both the stool top and the toilet seat cover are to be fastened to the seat with a draw cord which runs through the bias fold edging so that when drawn they make a generous fold around the rims. The toilet seat cover is left extra large, one-half yard each way so it can be made to fit any lid. Of course directions are included in any order. The three numbers—rug and two seat covers—may be ordered as a group under number M665C.

M665M Material for Rug \$1.20; M665S Material for Stool Top .50; M665T Material for Toilet Seat Cover .50; M665C Group of Three \$2.00.

Order from Embroidery Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, New York.

How Spring Came to My Kitchen

Yellow Paint and Drapes Do Much to Overcome Lack of Real Sunshine

IT was a dark, dreary kitchen, but somehow I accepted it as inevitable and didn't fret much about it. One day, friend husband, who is an amateur carpenter, decided to cut twin windows to the north. Those two beautiful windows faced into the orchard and all summer, while at work, I could watch all sorts of interesting things. When winter came, that cold, relentless north light showed how shabby the interior was.

How to remedy it, was the next question. Money was scarce, farmers' chronic condition, but something must be done. The walls had been papered, not a very satisfactory finish for a kitchen, but the plaster was rough and crumbly, also very thin. Friend husband thought new plaster was needed, but I felt I could not have that mess around, as we had no place to live and cook while it was going on. We compromised on wall board. My carpenter may be an amateur, but he is no tyro, for a neater job could not be imagined.

When it was painted a soft cream and the woodwork a deeper shade of yellow, the room seemed flooded with sunlight. I could scarcely believe it was my old dingy kitchen. Unbleached muslin trimmed with bands of blue checked

gingham made pretty curtains. A gay wall vase with trailing green made a happy spot. A bright painted tin tray on the clock shelf brought a bit of brightness there. I enameled tin book ends orange and black; they held some cook books on the same shelf. A cabinet table, wooden chairs and a breakfast table were painted with quick drying enamel, a citrus yellow trimmed with bright blue. The old Boston rocker had a coat too, also new blue and orange cushions. An orange striped breakfast cloth with my blue dishes makes a kitchen meal attractive. Mother's treasured yellow Majolica tea set is out too. Why not? Who appreciates pretty things more than tired folks.

My kitchen cupboards had never been finished inside, and I had to put papers on the shelves. They were regular dust-catchers too, but I did not feel that I could buy paint, for they would need three coats. I finally used orange enamel which I covered with one coat, painting a blue edge to the shelves. They are neat and attractive and can be wiped off easily. With the remains of my enamel I have painted coffee cans and half-pound baking-powder cans for spices. Some round tin boxes were had for the asking from my grocer and are great for cake and cookies. Enamel is expensive but covers so well it goes a long way.

Gay? Well as modern youth expresses it, "I'll tell the world we're gay," and I never had so much fun in my life.

You will note I haven't said a word about the floor; well, I really need new linoleum but would be far too proud if I had everything all at once, so there is something left to plan for.

—COUNTRY CONTRIBUTOR.

Youthfully Smart

2898

DRESS PATTERN NO. 2898 is youthfully smart for afternoon or "Sunday night" wear. Wine red crepe marocain, black chiffon or canton crepe would be both charming and useful. The cowl-draped bodice and capelet sleeves have a softening effect while the skirt places its fullness extremely low in graceful, flared movement. The pattern cuts in sizes 14, 16, 18, 20 years, 36, 38 and 40 inches bust measure. Size 16 requires 4½ yards of 35-inch material with 1½ yards of 35-inch lining. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with proper remittance in stamps. Add 12c for one of the Spring fashion catalogs and address to Pattern Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y.

Try This Method

FIVE-YEAR-OLD son objected to his dose of castor oil until I tried the following way of giving it. I added the oil to the juice of half an orange, put in a pinch of soda so that it foamed well and had the experience of having him exclaim after drinking it down, "That's good, mamma." This method was recommended by a trained nurse.

Another method given by a physician is to rinse the mouth first with peppermint (not too strong) then there will be no disagreeable taste of the oil. One might not be able to use this method with a child, but an older person would find it helpful.

In giving the oil to the children, I have sometimes added a few drops of peppermint and a little sugar to induce them to take it more readily. There is a castor oil compound on the market that is more satisfactory for children if one can obtain it. It has a pleasant taste and is not at all disagreeable to take.—E. M. N.

A Good Place to Live

(Continued from Page 3)

competent, therefore, to judge conditions and offer constructive suggestions for the improvement of transportation in general. In all matters, the Board has been willing to cooperate with the rural sections in improving conditions whenever suggestions have been advanced.

A Community Center

From the beginning the school has functioned as a community center—the meeting place of the P-T-A; the Business Men's Association; for recreational purposes; Homemaking Club for the mothers; boy and girl scouts, etc. At all times the Board has allowed willingly the use of the auditorium for community gatherings such as the Farm Bureau, plays or entertainments of educational value and other functions open to the public.

Rural pupils who become ill during school hours are reported to the office and either cared for at school or taken home by the attendance officer. Whenever a case appears to be serious, medical attention is secured after consulting the parent.

During the recess period at noon, the

gymnasium is open to rural pupils and the play periods are supervised by the physical director of the school. The time is divided between the boys and the girls so that games of various sorts suited to the needs of the individual groups may be enjoyed. Rural pupils who do not wish to avail themselves of the use of the gymnasium are allowed

Charmingly Slender

2922

DRESS PATTERN NO. 2922 is delightfully chic in its slim, tailored lines. Printed flat crepe, wool crepe or a tweed mixture would be well suited for this pattern which cuts in sizes 14, 16, 18, 20 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3½ yards of 39-inch material with ¾ yard of 32-inch contrasting. Price, 15c.

to read or study in their respective rooms and are in charge of one of the teachers. Playground equipment is provided for the summer months.

Cooperating With Parents

In many instances, the school may serve the people of the rural communities through the medium of the telephone. Frequently calls come to the school during the day from the parents of rural pupils requesting that their children assist them by doing errands in town. These calls are handled through the office with little loss of time. No pupil is called from class, but a note made of the call and the pupil notified at a convenient time either at the close of school at noon or night. Parents feel free to call and the school attempts to cooperate without loss of efficiency.

I believe that the people of our rural community feel that the central school is their enterprise and that they are receiving the cooperation of the school, the Board of Education and the townspeople. This feeling was evidenced last fall when the local Grange entertained the faculty of the Friendship Central School at a reception.

—ROBERT E. WITTER, Principal.

HENDERSON'S SPECIAL OFFER

IF you will send us 10 cents, and mention where you saw this advertisement, we will mail you Henderson's new catalogue, "EVERYTHING FOR THE GARDEN," and the new Henderson 25c Rebate Slip.

Every Rebate Slip Counts as Cash

The Henderson Rebate Slip, when returned to us, will be accepted as 25c cash payment on any order of Two Dollars or over. In addition, we will include with your order, without charge, our Henderson Specialty Collection of six of our best-known introductions:

One packet each of Ponderosa Tomato, Big Boston Lettuce, Early Scarlet Turnip Radish, Invincible Asters, Brilliant Mixture Poppies, and Giant Waved Spencer Sweet Peas.

"Everything For The Garden"

is the title of our annual catalogue. For 1931 it is a beautifully illustrated book with 16 full color plates and hundreds of interesting illustrations direct from actual photographs of results from Henderson's seeds—the finest and most complete catalogue we ever issued.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David's latest escapade is the release of a crow that Perry Larson had captured by endless patience and staked out in the cornfield to keep other crows away.

David is lonely but a new friend cures this trouble. Blind Joe Glaspell, who plays the violin, arouses David's sympathy and he loans Joe his father's violin. Soon David makes another acquaintance, Miss Holbrook. He names her "The Lady of the Roses."

David meets "Jack and Jill" when they rescue him from a rough and tumble scrap with a gang of boys who are tormenting Jill's kitten.

David goes home with Jack and Jill. It appears that Jack and the Lady of the Roses are not on friendly terms.

As we left David last week he just entered unbidden the music room of his "Lady of the Roses."

Once within the room David drew a long breath of ecstasy. Beneath his feet he felt the velvet softness of the green moss of the woods. Above his head he saw a sky-like canopy of blue carrying fleecy clouds on which floated little pink-and-white children with wings, just as David himself had so often wished that the could float. On all sides silken hangings, like the green of swaying vines, half-hid other hangings of feathery, snowflake lace. Everywhere mirrored walls caught the light and reflected the potted ferns and palms so that David looked down endless vistas of loveliness that seemed for all the world like the long sunflecked aisles beneath the tall pines of his mountain home.

The music that David had heard at first had long since stopped; but David had not noticed that. He stood now in the center of the room, awed, and trembling, but enraptured. Then from somewhere came a voice—a voice so cold that it sounded as if it had swept across a field of ice.

"Well, boy, when you have quite finished your inspection, perhaps you will tell me to what I am indebted for this visit," it said.

David turned abruptly.

"O Lady of the Roses, why didn't you tell me it was like this—in here?" he breathed.

"Well, really," murmured the lady in the doorway, stiffly, "it had not occurred to me that that was hardly—necessary."

"But it was!—don't you see? This is new, all new. I never saw anything like it before; and I do so love new things. It gives me something new to play; don't you understand?"

"New—to play?"

"Yes—on my violin," explained David, a little breathlessly, softly testing his violin. "There's always something new in this, you know," he hurried on, as he tightened one of the strings, "when there's anything new outside. Now, listen! You see I don't know myself just how it's going to sound, and I'm always so anxious to find out." And with a joyously rapt face he began to play.

"But see, here, boy,—you must n't! You—" The words died on her lips; and, to her unbounded amazement, Miss Barbara Holbrook, who had intended peremptorily to send this persistent little tramp boy about his business, found herself listening to a melody so compelling in its sonorous beauty that she was left almost speechless at its close. It was the boy who spoke.

"There, I told you my violin would know what to say!"

"What to say?—well, that's more than I do," laughed Miss Holbrook, a little hysterically. "Boy, come here and tell me who you are." And she led the way to a low divan that stood near a harp at the far end of the room.

It was the same story, told as David had told it to Jack and Jill a few days before, only this time David's eyes were roving admiringly all about the room, resting oftenest on the harp so near him.

"Did that make the music that I heard?" he asked eagerly, as soon as Miss Holbrook's questions gave him opportunity. "It's got strings."

"Yes. I was playing when you came in. I saw you enter the window. Really, David, are you in the habit of walking into people's houses like this? It is most disconcerting—to their owners."

"Yes—no—well, sometimes." David's eyes were still on the harp. "Lady of the Roses, won't you please play again—on that?"

"David, you are incorrigible! Why did you come into my house like this?"

"The music said 'come'; and the towers, too. You see, I know the towers."

"You know them!"

"Yes. I can see them from so many places, and I always watch for them. They show best of anywhere, though, from Jack and Jill's. And now won't you play?"

Miss Holbrook had almost risen to her feet when she turned abruptly.

"From—where?" she asked.

"From Jack and Jill's—the House that Jack Built, you know."

"You mean—Mr. John Gurnsey's house?" A deeper color had come into Miss Holbrook's cheeks.

"Yes. Over there at the top of the little hill across the brook, you know. You can't see their house from here, but from over there we can see the towers finely, and the little window—Oh, Lady of the Roses," he broke off excitedly, at the new thought that had come to him, "if we, now, were in that little window, we could see their house. Let's go up. Can't we?"

Explicit as this was, Miss Holbrook evidently did not hear, or at least did not understand, this request. She settled back on the divan, indeed, almost determinedly. Her cheeks were very red now.

"And do you know—this Mr. Jack?" she asked lightly.

"Yes, and Jill, too. Don't you? I like them, too. Do you know them?"

Again Miss Holbrook ignored the question put to her.

"And did you walk into their house, unannounced and uninvited like this?" she queried.

"No. He asked me. You see he wanted to get off some of the dirt and blood before other folks saw me."

"The dirt and — and—why, David, what do you mean? What was it—an accident?"

David frowned and reflected a moment.

"No. I did it on purpose. I had to, you see," he finally elucidated. "But there were six of them, and I got the worst of it."

"David!" Miss Holbrook's voice was horrified. "You don't mean—a fight!"

"Yes'm. I wanted the cat—and I got it, but I wouldn't have if Mr. Jack hadn't come to help me."

"Oh! So Mr. Jack—fought, too?"

"Well, he pulled the others off, and of course that helped me," explained David truthfully. "And then he took me home—he and Jill."

"Jill! Was she in it?"

"No, only her cat. They had tied a bag over its head and a tin can to its

tail, and of course I couldn't let them do that. They were hurting her. And now, Lady of the Roses, won't you please play?"

For a moment Miss Holbrook did not speak. She was gazing at David with an odd look in her eyes. At last she drew a long sigh.

"David, you are the—the limit!" she breathed, as she rose and seated herself at the harp.

David was manifestly delighted with her playing, and begged for more when she had finished; but Miss Holbrook shook her head. She seemed to have grown suddenly restless, and she moved about the room calling David's attention to something new each moment. Then, very abruptly, she suggested that they go upstairs. From room to room she hurried the boy, scarcely listening to his ardent comments, or answering his still more ardent questions. Not until they reached the highest tower room, indeed, did she sink wearily into a chair, and seem for a moment at rest.

David looked about him in surprise. Even his untrained eye could see that he had entered a different world. There were no sumptuous rugs, no silken hangings; no mirrors, no snowflake curtains. There were books, to be sure, but besides those there were only a plain low table, a work-basket, and three or four wooden-seated though comfortable chairs. With increasing wonder he looked into Miss Holbrook's eyes.

"Is it here that you stay—all day?" he asked diffidently.

Miss Holbrook's face turned a vivid scarlet.

"Why, David, what a question! Of course not! Why should you think I did?"

"Nothing; only I've been wondering all the time I've been here how you could—with all those beautiful things around you downstairs—say what you did."

"Say what?—when?"

"That other day in the garden—about all your hours being cloudy ones. So I didn't know to-day but what you lived up here, same as Mrs. Holly doesn't use her best rooms; and that was why your hours were all cloudy ones."

With a sudden movement Miss Holbrook rose to her feet.

"Nonsense, David! You shouldn't always remember everything that people say to you. Come, you haven't seen one of the views from the windows yet. We are in the larger tower, you know. You can see Hinsdale village on this side, and there's a fine view of the mountains over there. Oh yes, and from the other side there's your friend's house—Mr. Jack's. By the way, how is Mr. Jack these days?" Miss Holbrook stooped as she asked the question and picked up a bit of thread from the rug.

David ran at once to the window that looked toward the House that Jack Built. From the tower the little house appeared to be smaller than ever. It was in the shadow, too, and looked strangely alone and forlorn. Unconsciously, as he gazed at it, David compared it with the magnificence he had just seen. His voice choked as he answered.

"He isn't well, Lady of the Roses, and he's unhappy. He's awfully unhappy."

Miss Holbrook's slender figure came up with a jerk.

"What do you mean, boy? How do you know he's unhappy? Has he said so?"

"No; but Mrs. Holly told me about him. He's sick; and he'd just found his work to do out in the world when he

had to stop and come home. But—oh, quick, there he is! See?"

Instead of coming nearer Miss Holbrook fell back to the center of the room; but her eyes were still turned toward the little house.

"Yes, I see," she murmured. The next instant she had snatched a handkerchief from David's outstretched hand. "No—no—I wouldn't wave," she remonstrated hurriedly. "Come—come downstairs with me."

"But I thought—I was sure he was looking this way," asserted David, turning reluctantly from the window. "And if he had seen me wave to him, he'd have been so glad; now, wouldn't he?"

There was no answer. The Lady of the Roses did not apparently hear. She had gone on down the stairway.

CHAPTER XV

SECRETS

DAVID had so much to tell Jack and Jill that he went to see them the very next day after his second visit to Sunnycrest. He carried his violin with him. He found, however, only Jill at home. She was sitting on the veranda steps.

There was not so much embarrassment between them this time, perhaps because they were in the freedom of the wide out-of-doors, and David felt more at ease. He was plainly disappointed, however, that Mr. Jack was not there.

"But I wanted to see him! I wanted to see him 'specially," he lamented.

"You'd better stay, then. He'll be home by and by," comforted Jill. "He's gone pot-boiling."

"Pot-boiling! What's that?"

Jill chuckled.

"Well, you see, really it's this way: he sells something to boil in other people's pots so he can have something to boil in ours, he says. It's stuff from the garden, you know. We raise it to sell. Poor Jack—and he does hate it so!"

David nodded sympathetically.

"I know—and it must be awful, just hoeing and weeding all the time."

"Still, of course he knows he's got to do it, because it's out of doors, and he just has to be out of doors all he can," rejoined the girl. "He's sick, you know, and sometimes he's so unhappy! He doesn't say much. Jack never says much—only with his face. But I know, and it—it just makes me want to cry."

At David's dismayed exclamation Jill jumped to her feet. It occurred to her suddenly that she was telling this unknown boy altogether too many of the family secrets. She proposed at once a race to the foot of the hill; and then, to drive David's mind still farther away from the subject under recent consideration, she deliberately lost, and proclaimed him the victor.

Very soon, however, there arose new complications in the shape of a little gate that led to a path which, in its turn, led to a footbridge across the narrow span of the little stream. Above the trees on the other side peeped the top of Sunnycrest's highest tower.

"To the Lady of the Roses!" cried David eagerly. "I know it goes there. Come, let's see!"

The little girl shook her head.

"I can't."

"Why not?"

"Jack won't let me."

"But it goes to a beautiful place; I was there yesterday," argued David. "And I was up in the tower and almost waved to Mr. Jack on the piazza back here. I saw him. And maybe she'd let you and me go up there again to-day."

"But I can't, I say," repeated Jill, a

(Continued on Page 18)

(Continued from Page 11)

addition to those contemplated in the regular budget, but the purpose of the special message is to make a portion of regular appropriations available immediately. The total involved in the Gipsy Moth and forest nurseries projects is determined by the Division of Lands and Forests of the Conservation Department to be \$18,000, and it is expected that this amount will permit the employment of about 30 to 35 additional men.

Larry Fay Acquitted

ON Friday, January 16, following a five weeks trial which, it is estimated, cost the state \$800 a day, the jury freed Larry Fay and sixty-two other defendants. These men have been on trial charged with conspiracy to form a combination to fix prices.

Originally, one hundred and thirty-six people and companies were charged with this offense, but during the process of the trial, seventy-four of the defendants were freed. There were originally three counts in the indictment. Two of these were thrown out, leaving only the one on conspiracy to form a combination in restraint of trade.

Judge Koenig, in commenting on the case, criticized the indictment stating that had he been presenting the indictment he would have charged that two or more of the defendants entered into conspiracy to injure a particular person or persons.

Ask Game Clubs to Quarantine Imported Rabbits

CONCERN has been expressed by some New York State residents over the possibility of contracting a disease of rabbits known as tularemia. It would seem that the danger of this is not great, as records of the State Health Department indicate that only three cases in human beings have ever been recorded in the State. One in Buffalo and one in New York were apparently due to imported rabbits, and one recent case in the Adirondacks is said to have been traced to dressing an infected deer.

It is reported, however, that there is some danger of introducing this disease by importing rabbits from other sections. In this connection, Dr. Thomas Parran, Jr., New York State Commissioner of Health, and Henry Morgenthau, Jr., State Conservation Commissioner, on January 13, addressed a letter to approximately seven hundred fish and game clubs throughout New York State, calling their attention to this danger and asking their cooperation in preventing the introduction of the disease.

The letter points out that, up to the present time, the rabbits in New York State, New England, and Pennsylvania have apparently been free from this disease and it is believed that introduction of the disease can be prevented by adequate precautions. All rabbits shipped in from territory in which the disease is known to exist, should be quarantined for a period of ten days before being released and the carcasses of any animals dying during this period should be shipped to the State Laboratory at Albany for examination, the survivors being held until results of the examination are known. All fish and game clubs are urged to adopt these precautions.

One of the Cities to Get Regional Market

IN our January 3 issue we reported the recommendations made at the first meeting this winter of the Governor's Agricultural Advisory Commission. At that time we spoke of the approval of a system of regional markets throughout the state, the State Department of Agriculture and Markets being authorized to select the site for the first such market. Before this system can be put into effect, of course, legislation will be required making an appropriation for carrying out the work.

However, Commissioner Berne A. Pyrke of the State Department of Agriculture and Markets, indicates that after legislation is secured, the first of these markets will be in one of three upstate cities; namely, Rochester, Syracuse, or Albany. Buffalo is out of the picture because they already have two large marketing terminals which are deemed sufficient.

The Original, Successful All-Purpose Tractor

More Than 100,000
FARMALLS
Actually on Farms—
Abundant Evidence
of FARMALL Value

WHEN you own a FARMALL Tractor you have the original, successful tractor for row-crop and general farming. The FARMALL and Farmall Equipment give you exclusive patented features and special advantages obtainable *only* in the McCormick-Deering line. They give you an all-purpose tractor and equipment backed by years of experience—supported by more than 100,000 FARMALLS *actually at work* in all crops, under all conditions, in every part of the world.

The FARMALL has proved itself everywhere. It replaces 6 to 10 horses and 2 to 3 men. It enables *one man to farm intensively up to 200 acres*. In a 10-hour day it plows 7 to 9 acres, double-disks 18 to 25 acres, and drills up to 45 acres. With a 2 or 4-row planter it plants from 24 to 46 acres. It cultivates 2

or 4 rows; with a 4-row outfit it cleans 33 to 50 acres a day, and, in later cultivatings, 50 to 65 acres. It handles all haying jobs, cutting a 14-foot swath with a 7-foot Farmall-powered mower and 7-foot trailer mower attached, and it also pulls rakes, loaders, and operates stackers. It operates grain and corn harvesting machines.

There is no substitute for the FARMALL and FARMALL Equipment. Their owners are producing crops on farms like yours at costs lower than government figures on crop costs. FARMALL owners make a profit even in adverse years. Plan now to cut expenses in 1931 with the FARMALL. Ask the McCormick-Deering dealer about it and write us for catalogs.

Cutout Disks
Do More Work
With the
Same Power

Very often farmers ask us which does better work the Cutout or Solid harrow disk.

We're in a position to give a fair answer because we make both kinds. The quality and price are the same.

We always recommend the "Cutaway" Cutout disk. "Cutaway" Cutout disks penetrate easier and deeper. That means more work with the same amount of power. In stony soil "Cutaway" Cutout disks work between the stones. A solid disk has the tendency to ride over them. And because the Cutout disk has more cutting surface than a solid disk of the same diameter, it cuts, chops and pulverizes clods, lumps, trash more thoroughly. A finer, smoother seed bed results.

The important thing, however, is to be sure your disks—whether Cutout or Solid—are genuine Cutaways. For only the genuine are heat treated and FORGED sharp. Only the genuine are unconditionally guaranteed for 3 years against breaking or cracking.

Clip coupon for FREE catalog which shows 22 types and 101 sizes of disk harrows and plows.

The Cutaway Harrow Company,
87 Main Street, Higganum, Conn.

Please send me FREE catalog and book, "The Soil and Its Tillage."

Just David

(Continued on Page 16)

little impatiently. "Jack won't let me even start."

"Why not? Maybe he doesn't know where it goes to."

Jill hung her head. Then she raised it defiantly.

"Oh, yes, he does, 'cause I told him. I used to go when I was littler and he wasn't here. I went once, after he came,—halfway,— and he saw me and called to me. I had got halfway across the bridge, but I had to come back. He was very angry, yet sort of—queer, too. His face was all stern and white, and his lips snapped tight shut after every word. He said never, never, never to let him find me the other side of that gate."

David frowned as they turned to go up the hill. Unhesitatingly he determined to instruct Mr. Jack in this little matter. He would tell him what a beautiful place Sunnycrest was, and he would try to convince him how very desirable it was that he and Jill, and even Mr. Jack himself, should go across the bridge at the very first opportunity that offered.

Mr. Jack came home before long, but David quite forgot to speak of the footbridge just then, chiefly because Mr. Jack got out his violin and asked David to come in and play a duet with him. The duet, however, soon became a solo, for so great was Mr. Jack's delight in David's playing that he placed before the boy one sheet of music after another, begging and still begging for more.

David, nothing loath, played on and home. Like old friends the melodies seemed, and so glad was David to see their notes again that he finished each production with a little improvised cadenza of ecstatic welcome—to Mr. Jack's increasing surprise and delight.

"Great Scott! you're a wonder, David," he exclaimed, at last.

"Pooh! as if that was anything wonderful," laughed the boy. "Why, I knew those ages ago, Mr. Jack. It's only that I'm so glad to see them again—the notes, you know. You see. I haven't any music now. It was all in the bag (what we brought), and we left that on the way."

"You left it!"

HANDY ANDY Says "Here's How"

To Keep Your Pump from Sucking Air

By Ray Inman

IF YOUR PUMP SUCKS AIR IN SPITE OF PRIMING YOU MAY NEED NEW LEATHERS ON YOUR PLUNGER OR,

OF COURSE, ANY PUMP THAT'LL DO THIS IS IN PRETTY BAD SHAPE

HEY PAW! STOP THAT THING! IT'S IN REVERSE!

BETTER STILL - DROP THE PUMP CYLINDER TO JUST BELOW WATER LEVEL.

MAYBE THIS IDEA AINT WORTH SOMETHING, EH? - OR MAYBE IT AINT.

GOODNESS, THYROID, THIS IS EVER SO MUCH BETTER THAN BEATING.

WHOOOBBB GIVE ME THE BEATING ANY DAY!

THIS WILL PROVIDE A CONSTANT PRIMING FOR YOUR PLUNGER.

WHAT! AINT YOU GOT THAT PUMP PRIMED YET?

GOSH, BOSS, I BEEN POURIN' WATER IN LIKE YOU SAID - BUT I CANT GET IT T'STAY DOWN. IT ALLUS PUMPS OUT AGAIN.

PUMP WILL WORK BETTER IF THE PIPE BETWEEN CYLINDER AND PUMP BASE IS SAME SIZE AS CYLINDER.

ARE YOU THE LEAST BIT GOOFY? THEN—

here's the PEN

Are Canning Companies Fair?

FREQUENTLY we get letters from subscribers telling of their troubles with the local canning companies. In a recent letter which we have followed for some time, the subscriber stated that he felt sure an error had been made by the company and that he did not get paid for as many peas as he actually delivered. In this connection, it would seem that the company was very much inclined to let matters ride as they were, and were not willing to admit any mistake or, if they did admit a mistake, it seemed to be impossible to get hold of anyone who had the authority to correct it.

In general we feel that canning companies are as reliable as any other type of business. However, it does seem that there are a few things which need correction. We do not believe that any reliable canning company has a policy of deliberately short-weighting farmers although it is possible that individual employees may be very unfair. On the other hand, we know that mistakes are easily made, and we feel that every man who delivers produce to a canning company should get a weight slip showing the amount delivered. In the case of such a crop as peas, which have to be threshed out, before they are weighed, this would necessitate giving a weight slip when the next load was delivered, or perhaps mailing it to the grower. This is a protection for the canner as well as the grower.

In the second place, if there is any evidence of a mistake, the matter should be taken up with the company immediately, rather than allowing it to drift, as the longer it is allowed to go, the harder it is to get it straightened out.

Unfortunately, it appears in some cases that the grower tries to put something over on the canning company. When this occurs it is not likely to make the relations between grower and canner any more cordial. Sometimes this feeling develops until it gets to a point where the grower is continually trying to get the better of the company and the company, on the other hand, gives absolutely no consideration to growers.

In general we may say, that the erection of a canning company backed by responsible parties is an asset to any community. With the proper consideration shown by both parties, it would seem that both would be benefited. Perhaps some of you have had

experiences with canning companies, either favorable or otherwise, that you would like to tell us about. We would be glad to have your letter and to print such of them as appear to be of value to our readers.

Fraud Order Against J. L. Tomberlin Oil Properties

FRAUD order No. 555 was issued by the Post Office Department December 3, 1930, against J. L. Tomberlin Oil Properties, Inc., J. L. Tomberlin and their officers and agents for being engaged in conducting a scheme for obtaining money through the mails by means of false representations and promises in connection with the sale of fractional interests in oil and gas leases and royalties and in oil drilling promotions.

Tomberlin sent out letters in February declaring he was going to try to break all speed records on his Abbot No. 1 well and describing it as a "discovery gusher . . . A GUARANTEED COMPLETED WELL . . . IN GOLDEN PROPERTY . . . capitalized for only 3,000 DIRECT OWNERSHIP ASSIGNMENTS at \$10.00 each." However, the Post Office Solicitor's evidence indicated that this well had not been drilled, that Tomberlin had not returned to investors money obtained by enticing promises and that he had no justification for the use of such terms as "golden property" as the only well in the field at the time was 300 feet from a dry hole.

Do Schweikert, Esposito and Bruno Owe You Money?

WE have just been informed that Schweikert, Esposito & Bruno have discontinued business but they are paying all consigners of farm produce. If any of our readers have sent them produce and have not received their pay, let us know and we will take the matter up with them.

The free mimeographed bulletin R 1, "Bolts for the hour of need", suggests the selection of bolts for use in emergencies. A card to the mailing room, Roberts Halls, Cornell University at Ithaca, New York, will bring you copy.

Two Thousand and No/100	- Dollars		
PAYABLE THROUGH THE NORTHERN TRUST CO. CHICAGO, ILL. 2-15			
Claim Examiner			

THE family of Mr. Thomas P. Fleming, deceased, Southbury, Conn. receives North American Accident Insurance Company draft for \$2,000 because Mr. H. M. Crandall A. A. Salesman had made it possible for Mr. Fleming to take out a Farm Machinery Policy when subscribing to the "old reliable."

The family acknowledged draft with the following letter:

Dec. 29, 1930,
Southbury, Conn.

Dear Mr. Weatherby:

Received your letter of Dec. 24th with draft for \$2,000 in payment for indemnity due on the \$2,000 Limited Farm Machinery Policy held by Thomas

P. Fleming, with the North American Accident Insurance Company.

Thanking you very much for the promptness with which this claim was paid, I also wish to state that I think this is one of the best farm Accident policies I have ever seen, and gladly recommend it to anyone eligible.

Yours very truly,

John T. Fleming,

Adm. Est. of Thomas P. Fleming.

Mr. Fleming's policy cost him \$2.00 a year in addition to the price of the subscription. The policy covered injuries sustained from 20 farm machines, wagon or sleigh, being struck by lightning or injured in burning buildings, tornadoes or cyclones.

They Penetrate, Pulverize and Pack the Soil Full Width

John Deere's ever-growing disk harrow business has been built up largely on the good performance of the John Deere Model B and Model L Disk Harrows—their ability to penetrate, pulverize and pack the soil full width under all conditions.

For more than thirty years the Model B has been recognized as the most successful horse-drawn harrow of its type. The same principles of construction have been built into the Model L Tractor Disk Harrow to insure flexibility and good work. The famous pressure spring and pivoted yoke features keep the disks working at even depth over ridges

The Model B, a horse-drawn harrow, has the strength to match your tractor power. It can be quickly converted into a double-action harrow by adding a rear section which we can furnish. Sizes: 4 to 10 feet.

or depression. Both machines are extremely flexible. One gang can rise over obstructions without affecting the rest of the machine. Both have heat-treated alloy steel disk blades, and double-bar gang frames.

The yielding lock coupling used on the Model L to keep the rear disks in proper alignment is also used when attaching a rear section to the Model B to make it a double-action disk harrow.

Ask your John Deere dealer to show you the many features of these better field-proved disk harrows. Write for free descriptive literature. Address John Deere, Moline, Ill., and ask for MA-91.

John Deere Model L Tractor Disk Harrow working in cornstalks. Scrapers on both sections can be oscillated to prevent clogging in sticky soil or trashy fields. Made in sizes from 6 to 10 feet wide.

More real progress in designing farm buildings has been made during the last twenty years than during all the preceding centuries.

Because the Jamesway organization has been the leading contributor to this development of better barns and farm buildings, our organization has become the largest of its kind in the world. We gladly extend to all who are going to build or remodel any farm building the services of Jamesway.—W. D. James.

Don't

You are interested in farm buildings—every farmer is. The important part that properly designed farm buildings have in increasing the profit return of farm animals is today recognized by every up-to-date progressive farmer.

That's why you'll be interested in looking through this New Jamesway Book—you'll see a wonderful collection of the very latest and most modern farm buildings—you'll see "before" and "after" pictures of many farm buildings that Jamesway have converted from unprofitable wasteful buildings into modern, convenient, sanitary, profitable buildings at a very moderate cost.

As you look at some of these pictures and see the changes that Jamesway have made—how they have utilized all the available material in the old buildings—how they have rearranged it and made everything so convenient—every door and every window just where it should be—then as you read what the owners of these buildings say about how Jamesway saved them money—you'll begin to appreciate, as perhaps you have never appreciated before, what Jamesway service really means.

For more than a quarter of a century Jamesway Dairy and Poultry experts have been working and developing better methods of housing, heating, insulating, ventilating and equipping for farm stock—how to do it in the best and most economical way. All of this vast experience gained in 25 years of research has been compiled in our New Jamesway Book—the most complete information on the subject that can be obtained.

We want to send you this New Jamesway Book—we want you to know how we can help you with any building or remodeling job. We want to show you how we can *make and save* you money if you will only consult us before you build, remodel, ventilate or equip any farm building.

What's New in Jamesway?

Here's the New Jamesway Round Brooder House—something entirely new and different. Before you buy or build a Brooder House investigate the Jamesway. It's head and shoulders above them all.

Has insulated roofs and walls—Metal window sashes—Transom ventilating windows—400% sunshine on the floor—Special screen door—Complete built-in ventilating system—Smoke stack built into roof ventilator—Sealed joints—no cold corners—no drafty spots. Comes knocked down in sections—easy to erect. It is built right, but is not expensive. Just the kind of Brooder House YOU want. Be sure to mark the coupon below for information on this wonderful New Brooder House.

Come to Yellowstone With Us

STARTING on August 1st, American Agriculturist will conduct, in cooperation with the Northern Pacific Railroad, a tour for the benefit of A.A. folks, to the Yellowstone National Park and return. One of the beautiful views that will be seen is the Gallatin river and the Spanish Peaks pictured on this page.

No tour to any part of the United States could be more interesting than to the great Yellowstone National Park with its wonderful mountains, boiling springs, geysers, and animal life. Those who go will be completely relieved of all detail—not a thing to do or to worry about except to enjoy yourself from beginning to end. Write for full particulars without obligation to: Yellowstone Tour Editor, American Agriculturist, 461 Fourth Ave., N. Y. City.

SPECIAL ISSUE FOR WOMEN

What will Your Cows FIND?

600 pounds 5-8-7 fertilizer per acre yielded 6,958 pounds of green feed per acre.

Unfertilized, yield 1,513 pounds. Photographed at turning out, six weeks after fertilizer was applied.

DRY weather has made hay and silage crops short. Cows will be turned out to pasture earlier than usual. How much real feed will your cows find in your pasture?

Last year many dairy farmers found that fertilized pasture produced good green feed two weeks before unfertilized pasture was fit to graze. This earlier grazing decreased feed costs and increased milk flow enough to pay for the fertilizer, before the unfertilized pasture land was ready to graze.

Fertilized pastures kept on produc-

ing feed after the unfertilized grass was dry and brown. In 50 tests in nine northeastern states the average profit was \$29.62 above the cost of the fertilizer. This profit was secured by more days of good grazing — earlier in the spring and later in dry weather.

It will pay you to give your pasture 600 pounds of well balanced potato fertilizer per acre six weeks before you turn out your cows.

OATS

SENSATION—One of the most productive oats in cultivation. 75 bu. and upward per acre are frequent, with large, white, meaty grains weighing 44-46 lbs. per measured bushel, of the highest quality. We are making an exceptionally low price in quantities. You should by all means try these oats. Also Early Clarage and White Cap Seed Corn, Bearded and Smooth Barley, Soy Beans and Sweet Clover. Write us for samples and prices.

What Type of Silage Corn?

Is it best to plant a silage corn that will produce ears or to grow one which will produce the largest amount of green feed?

THIS question has been debated at considerable length and yet not everyone agrees as to the right answer. In fact, the right answer may depend upon circumstances. I think it is generally agreed that a corn that will produce ears will give more food value per ton and probably more food value per acre. However, some dairy-men feel that succulence is more important than nutrients and they prefer to grow the largest possible amount of green matter per acre. Therefore, they plant a late maturing variety.

New Hampshire Potato Growing Practices

PROFESSOR FORD PRINCE of New Hampshire, in studying the methods used by the potato growers who secured best yields in the State of New Hampshire, lists the following practices which were followed by most of them:

- 1—The majority of them used nothing but certified seed.
- 2—They planted liberal quantities, averaging 17.3 bushels per acre, with a maximum of 20 bushels.
- 3—Over half of them plowed up old fertilizer, averaging 2030 pounds per acre.
- 4—Nine of them used high-analysis fertilizer exclusively.
- 5—All sprayed or dusted an average of six times.
- 6—They harrowed their land four times before planting.
- 7—They cultivated about five times after the plants came up.
- 8—Over half of them plowed up old hay land for the crop.
- 9—Several of them plowed in the fall as early as August.

The Carrot Rust Fly

When we pull carrots from our garden, they are covered with narrow furrows and also have little holes running into them. What is doing this damage and is there anything we can do to remedy it. —L. C., New York.

THIS sounds like the work of the carrot rust fly. The larvae of this fly burrow into parsnips as well as carrots. It usually does more damage in gardens than when carrots are planted in the field. Late planting may help by delaying the crop till the spring brood is over. Some experiments have been made in using chemicals to keep away the flies so they will not lay eggs. A 1 to 1000 solution of corrosive sublimate will prevent infestation if put around the plants just as the flies begin to lay eggs. This time will depend some on the season and on the locality.

Growing Marketable Cabbage

The market seems to prefer small cabbage heads. What can we do to raise a crop that meets this demand and still keep up a good production per acre?

ONE of the best ways of growing cabbage which are not too large for the best market price is to set the plants relatively close together in the row. Experiments have shown that putting the plants from 15 to 18 inches apart in the row will produce a total yield which will be good and that the heads will not grow too large.

Rate of Seeding of Peas

Will we get better results with canning peas by using 4 or 4½ bushels of seed per acre?

THIS may depend some on the type of soil you are using. It is generally recommended that planting be a little heavier on heavy soil. If your soil is heavy sow at the rate of 4½ bushels and if it is light probably 4 bushels will give just as good results.

With the Fruit Growers at Rochester

Exhibits, Talks, Discussions and Contests Make Up Fine Program

FRUIT growers in Western New York look upon the annual meeting of the New York State Horticultural Society as one of the big events of the year. During the past few years, in addition to the talks and discussions on production problems, several features have been added to the program which are decidedly interesting and thought-provoking.

For example, at the annual dinner of the Society at the Hotel Seneca, three high school students in agriculture gave original talks in competition for substantial prizes. The first prize was awarded to James Chapman of Newfane, who won a \$25 prize given by the Rochester Chamber of Commerce. His topic was "Keeping Pace With the Apple Situation." Second prize of \$15 went to William Lally of Geneva, who talked on "Changing Styles in Fruit." The third prize of \$10 went to Ralph Walker of Webster, who talked on "Marketing Apples of New York."

The judges of this contest were Walter Clark of Milton, James Case of Sodus, and George Crittenden of the State School of Agriculture at Cobleskill.

During the meeting two other contests were held for high school students in agriculture. One was a fruit-judging contest and cash prizes were awarded by the Rochester Democrat and Chronicle to the following boys:

George Bodine, Sodus; Kenneth Burger, Geneva; Melvin Pierce, Canandaigua; Carlton Georgeman, Geneva; Ward Robbins, Geneva; Glen Eygnor, Wolcott; Gerald Wells, Albion; Kenneth Nixon, Livonia; Donald Hayden, Wilson; George Crowther, Sodus; and Wilfred Cottrell, Sodus.

The Buffalo Evening News' trophy for the school scoring the highest number of points went to Geneva High School with a score of 3135. Other scores were: Sodus, 3100; Wolcott,

2965; Wilson, 2960; Canandaigua, 2795; LeRoy, 2740; Albion, 2730; Phelps, 2715; Webster, 2690; Churchville, 2655; Bergen, 2625; Newark, 2540; Livonia, 2345; Naples, 2150.

Sodus High School won a plaque offered by the Rochester Times-Union for winning the most points in the boys' fruit exhibit.

There was also a Disease Identification Contest, which was won by Russell Cook of Newfane, with a score of 19 out of a possible 20. Other scores were: Edmund Rings of Wolcott,

16; Emmett Kerwin of Newfane, 15; Wilfred Cottrell of Sodus, 15; James Myers of Canandaigua, 15; Henry Van Acker of Sodus, 14; William Rothfus of Webster, 14; Herbert Keitel of Albion, 14; George Dewey of Canandaigua, 13; Frederic Barnum of Wilson, 13.

Newfane High School won a plaque offered by the LeRoy Gazette to the school having the highest team score in this contest. The team from Sodus had the second highest score and the team from Webster the third highest.

These contests, of course, might be called secondary to the meeting itself, yet they add much to the entertainment and information which may be secured by those attending.

Another event which has attracted much attention for the past three years, is a commercial exhibit for packages of graded apples. This year Inspector H. S. Duncan had his men select 80 packages of apples on the open market and these packages were opened and regraded at the meeting. It is gratifying to know that a steady improvement has been shown in the excellence of the pack each year. This time about 90% of the packages were found to be graded as marked.

In this connection, C. P. Norgord, Assistant State Commissioner of Agriculture, unveiled an "Honor Roll of Good Packers" which contained the names of growers whose packs were found graded properly.

President William J. Hall, in his annual address, referred to the hard times and low prices which all farmers are now experiencing, but rather emphasized the bright side of the picture. President Hall said:

"No report of lack of food or shelter for fruit growers of our state has been received, but we read that in the areas of severe drought

(Continued on Page 18)

Resolutions Adopted at Horticultural Society Meeting

The following resolutions received favorable action by the members present.

1. Asking that the new horticultural building at the Geneva Experimental Station be named Hedrick Hall.
2. Asking that the Legislature vote funds and a committee of the society be named to confer with the directors of the state experiment station, to evolve a plan of patenting discoveries of the stations, so that they may be preserved to the people of the state.
3. Asking that the Legislature appropriate \$2,500 a year for five years to pursue investigations for control of fire blight.
4. Asking that the Legislature make provision for enlargement of the studies of American foulbrood and protection of bees.
5. Asking the Dean of the State College to assign a specialist in beekeeping to work in the fruit regions of the state.
6. Asking that a new horticultural building be provided at the State Fair.
7. Asking a law be passed providing for rigid inspection of all fruits and vegetables shipped into New York State.
8. Asking continuance of appropriations by the state for the control of Oriental peach moth.

Keep the Spirit of the Old House

How One Woman Very Cleverly Developed the Old Kitchen into a Charming Room

THE corner of the year has been passed and farm folk are full of plans for the coming season. Days may be gloomy now, but the return of spring will have the usual effect of making everything about the house look shabbier than ever. So it is a good plan to use the shut-in days to good advantage by furbishing up and re-arranging the inside of the house.

The accompanying illustration of the delightfully simple, yet dignified living-dining-room shows what one clever person did to an old farm kitchen to make it fill a real need.

The fireplace which had been boarded up now forms the center of interest, with its bright fire, its fire tools, its old rifles slung above it, and the simple mantel board holding decorations in keep-

ing with the spirit of the room. Washington's picture, pewter candlesticks and plate, ivy-filled vases of colonial shape make a harmonious group.

The walls, doors and woodwork were painted a colonial ivory, which is a very satisfactory background for furniture and hanging. The old beams in the ceiling were treated with stain and varnish remover, then given a coat of flat varnish, the ceiling itself being painted ivory, a little lighter than the walls. The chairs were old ones freshened up by a coat of black lacquer and pretty decalcomania transfers. The old hanging lamp was given a coat of metal paint, was electrified and now serves to emphasize the colonial atmosphere of the room, besides furnishing light in a most practical way.

The floor, after having all old paint removed, was stained a dark walnut, then given two coats of good floor varnish.

In such a room the ordinary living of the family may go on, meals served, games played, sewing done, and friends entertained. Not every farmhouse has such a room, but I have seen many, many of the little, old, clapboarded houses which would feel just right on the inside if their occupants carried out some such idea.

The other illustration shows how a handy husband may add a corner of convenience and charm to the living room. The extra section of shelving under the window offers a place for a flowering plant, for magazines,

for work baskets, for games. Nothing gives a room a more cultured air than neat shelves of books which show they are in constant use by the family. An easy chair, a convenient table beside it and a reading lamp invite one to tarry there. As for the finish on the shelving, it

(Continued on Page 14)

This is the gratifying result of the first step towards making a beautiful home from an old, neglected farmhouse.

A set of bookshelves, fashioned by the home carpenter and painted a cheerful color, will make a bare corner of the living room bright and cosy.

Thought for the Week

Myself

*I have to live with myself, and so
I want to be fit for myself to know.
I want to be able, as days go by,
Always to look myself straight in the eye;
I don't want to stand with the setting sun,
And hate myself for the things I've done.*
—Selected.

Why Not Spend It For Dirt Roads?

RECENTLY, Arthur M. Hyde, Secretary of Agriculture, announced that New York State will have \$23,548,812 of State and Federal funds available for new road projects in New York State. This is more than any other State will get for road building.

On December 20th, Congress appropriated \$80,000,000 for emergency road construction to increase employment.

This is fine, but why must all of this money be spent for building new main highways when there is such a crying need of it for building farm-to-market roads to replace the dirt roads? We have no quarrel with building new State roads, but there are enough of these so that people of the State can get along for a time, making the road money available to help dirt road farmers who need it so badly.

Talking of farm relief, or of consumer relief, either, what better help could be given either farmers or consumers than better roads from the farms themselves to the markets—roads which would greatly cut down the cost of marketing products, increasing the farmers' income and decreasing the cost to the consumer.

Come to Farm and Home Week, February 9th to 14th

THE great crowds of farm folk who return year after year to their State College at Ithaca for Farm and Home Week testify to the fun and the help they get from this great event in the agricultural year. Each year the program gets better. This year, an especial effort has been made to entertain as well as to instruct. George Russell, the famous farm poet and philosopher of Ireland, will be present to discuss his theories of rural life, which we have several times spoken of in the A. A. Ruth Byran Owens, the daughter of William Jennings Bryan, will be another speaker.

In order that the thousands who attend can

be sure of hearing all these talks, loud speakers have been installed in Roberts Hall and in the Agricultural Engineering Laboratory.

Governor Franklin D. Roosevelt will be a guest of the College and will deliver an address in Bailey Hall. On Thursday evening, February 12th, the Governor will attend the American Agriculturist-Master Farmer Banquet and will award personally the Master Farmer medals to the Master Farmers of 1930 and to the young people who have won American Agriculturist Achievement Awards, known as the 4A Awards.

Tickets for the Master Farmer dinner this year will cost \$1.75. The dinner will be held in Willard Straight Hall, and the capacity is only 325. It is expected that at least double this number will wish to attend, so we suggest that you put in your reservations for your tickets immediately. Address the Editorial Department of American Agriculturist, 461 Fourth Avenue, New York City.

Taxation—Where Is It Going To End?

TAXATION time is here again, and the bills this year are just as discouraging as ever.

We are not an alarmist nor a radical, but there is certainly serious trouble ahead unless public officials wake up to their responsibilities for the ever-increasing costs of government.

For more than ten long years, depression and hard times have camped on the doorsteps of American farmers. For more than twenty years, taxes have piled up higher and even higher. The situation in the cities is equally bad except that until recently most city taxpayers have had more to pay with than farmers. City home owners have been driven into apartments because they felt they could not pay the heavy taxes on their homes, and then, of course, the apartment was no escape, for the taxes were added to their rents.

During the past two years, the State of New York has made a commendable effort to adjust farm taxation to relieve the burden on agriculture, but these new State laws have not helped as much as they should because many local tax officials have made no effort to do their part. Now, of course, most of the public money that is spent is for worthy purposes, but a lot of these purposes we can get along without until the taxpayer has a chance to catch up. When your individual expenses as a farmer exceed your income, what do you do? If you are wise, you cut down the expenses, even for things you have considered necessary. The same principal must be applied to government. The incomes of almost all taxpayers have been sadly reduced. Government officials must realize this, and "cut their suit according to the cloth." The war is over; it is time to stop spending.

Our Sense of Humor

SOME say that we are born with our sense of humor; certain things tickle it while others leave us cold. But there is no doubt that one can cultivate a taste for the delicate and fine or can become known for his coarseness.

Horseplay or slapstick humor is the only kind which appeals to some: the children ape their elders, and so it goes on from generation to generation. The party that went from farmhouse to farmhouse on New Year's Day, dousing their friends with a bath of flour had a hilarious time. It was pretty hard on some people's clothes and sort of clogged up their breathing apparatus, but the jokers enjoyed themselves hugely.

Women are supposed to create a little finer atmosphere and hold up the standard of conversation and jokes, where they are in order. A woman who tells a coarse joke lowers the tone of the group at once. I know one young man who used to exercise some degree of discretion about the jokes he told publicly, but after some years of marriage to a girl who likes her jokes with a little shade to them, everybody steels himself to hear the worst when he opens his mouth.

We accuse the English of lacking in humor;

they accuse us of being able to relish only the jokes whose points are very obvious and glaring. It is very evident that they cultivate one type of humor and we cherish another.

Just as a mother finds it necessary to help her little child to curb selfishness or a desire to destroy things, so can she help him to appreciate the finer type of the humorous in situations or jokes. Causing discomfort or embarrassment to others certainly does not belong in the gentleman's creed, and therefore is taboo, even in her lighter moments.—G. W. H.

Grandma's Parlor

CAN you not remember the old-fashioned farm parlor, guarded so jealously both from the sun and the small boy the year around? Of course you do. The blinds were kept tight shut; a few unused books reposed at just such an angle on the center table while the horsehair sofa with a couple of uncomfortable chairs to match sat formally against the wall.

There are still a few such "parlors" left, but, thank the Lord, they have disappeared from most homes, and in their place we have living rooms. For we have come to realize that a house to be a home is the servant and not the master of the family.

How many, many women one can call to mind who have been nothing more nor less than slaves to the petty round of household duties, many of which, like taking care of Grandma's old dark parlor, never did anybody any good. One of the good things of these modern days, is that we have come to know the value of labor and, therefore, to spend it more wisely on the things that count toward happiness. This, it seems to us, as a mere man observer, is especially true of the homemaker. Modern conveniences and scientific knowledge have gone a long way toward emancipating women from the drudgery of housework and in making houses into homes.

For a Three-Fourths Year Car License

"I wish to say that a good change in the law would be to charge only three-fourths of the annual fee on licenses issued about April 1st of each year. I live on a dirt road two miles off the State road. It is very seldom that I can drive my car before the first of April but I have to pay as much for my license as a person living on the State road and driving every day in the year. There is also a considerable period in the winter when I cannot drive my car. Sometimes, I have been obliged to put it up about Thanksgiving time."

THAT the license year should be shorter for cases of this kind is just plain justice. This publication advocated a three-fourths license year last year but the bill was not passed. The best way to get it through the Legislature is to see to it that your Assemblyman and Senators from your district know how you feel in the matter.

Over half of the farmers of New York State still live on the dirt roads. They have paid taxes for many years to build State roads and yet, for a good part of the year, as our correspondent above indicates, they are unable to use the State roads to any advantage but pay just as much as the other fellow for the privilege.

Aunt Janet's Chestnut

EVERYONE who ever attended a glee club concert or listened to the radio many evenings can appreciate the following story:

The visiting grange quartet was singing plantation melodies as their contribution to the "Visitors' Night" program. As the melodies went on, a man in a front seat was seen to wipe his eyes furtively, and a few minutes later he burst into tears.

The manager of the quartet slipped around and touched him on the shoulder.

"My dear sir," he said, "our quartet deeply appreciates the compliment you have paid it by this display of emotion. You are a southerner, no doubt?"

"No," sobbed the man, "I'm a musician."

Shut-In Time Is Sewing Time

Winter Offers the Opportunity for Stocking Up the Family Wardrobe

WINTER time is ideal for certain sewing jobs, as there will surely be stormy days when one must stay indoors and there will be few interruptions from without. By getting materials and patterns ahead of time, such days may be made wonderfully productive of results, so that the year gets off to a good start.

Household linens of all kinds should be gone over and the supply built up where it needs it. Sheets, pillow cases, kitchen towels, tablecloths and napkins can be stocked at this time, either from the numerous white sales or by hemming up the piece goods oneself.

If one feels hesitant about making up spring and summer dresses before the season is fairly launched, there are still a great many articles of clothing which are standard enough in style that it is safe to make up the year's supply now. Aprons of all sorts are needed, the practical gingham ones, the pretty tea aprons. But one need not sacrifice beauty to practicality—it is entirely possible to make even an apron both practical and attractive. The accompanying illustration shows a very feminine apron which I have seen made up in a pretty print with colored binding to match the figures.

The nightie No. 2505 is very dainty with its cap-effect yoke. Voile, nainsook, dimity, rayon silk or crepe de chine in the pretty colors now used for undergarments would be very becoming. I saw this made up in rose colored voile, with orchid colored binding around the yoke. If one wants to lay up a supply of gifts, such a nightgown embroidered in simple stitches, nicely chosen for color, would be most acceptable to anybody.

The dance set of panties and bandeau, No. 2861 is another happy idea for gifts or for the regular supply of self (provided self is slender), or for school girl

daughter. The figured dimities are very popular for summer use, whereas pongee, rayon, cotton broadcloth or even light wool jersey for very cold weather would be very suitable. The bandeau should be of a firmly woven fabric in matching colors.

As for the slip, no one can have too many of these. The pattern shown here allows for fullness in walking, at the same time being well fitted around the waist and keeping out of sight around the top, all points in favor of a well-behaved slip. It also offers attractive ways to use lace, a very popular trim just now. Rayon, crepe de chine, radium silk, pongee, fine cotton broadcloth, or nainsook can be used, depending upon whether the slip is for every day or "best" wear.

Smocks are as useful as the day is long. If the house has cold corners which require one to wear an extra layer of clothing, a smock affords a very nice way out. Or if one must use that dark woolen frock for a house dress, a pretty, colorful smock worn over it does much to remove the curse of gloom. If the lady of the house has a summer trade

in chickens and vegetables, a crisp, white smock hanging where she can skin into it in a jiffy places her, clean and smiling, before her customers.

Although one may feel during the winter as if a dainty cool housedress would never be needed, we shall certainly have hot weather sooner or later, and our experience has been that there's precious little time for sewing when hot weather does come. The attractive housedress design shown here No. 2728, is adaptable to any figure and especially fortunate for the figure that must watch its lines. Polka dots in bright colors are very good this season and when used in dimity or print, with collar and belt to match the dot, this little frock would do for anybody. Never has there been such a lovely range of design and color in cotton fabrics, so there is no reason why a woman should ever look unattractive.

Where there are children to sew for, it pays to get their early spring supply made up before the rush of outdoor work and spring housecleaning. The little bloomer dress shown on this page is simple to make and easy to launder. Broadcloth, satine, fine rep, gingham, or print in the small figures can be had in colors becoming to childhood.

The boy's shorts and waist can be made to answer almost all purposes. In khaki they are for play or school; in cotton broadcloth shirt and jersey or tweed shorts, with tie and sweater to match, the little man is ready for almost any place. A top coat would complete the outfit.

For the junior miss, nothing is so useful as the all-purpose frock of jersey, cotton broadcloth, cotton tweed, rep in the brilliant new colors or print in the heavier materials. Silk or rayon crepe makes a more dressy dress. The pattern shown here No. 2930, has the sweet simplicity which youth needs, yet has the points of style which distinguish the season, namely, the flaring skirt and the button trim.

It would never do to end this article without a reference to spring dresses for madame herself. Two are shown, one the deservedly popular jacket outfit, No. 3003, the other a soft, gracious affair for afternoon wear, No. 2997. The jacket suit is composed of a dress having its bodice of contrasting color, and the coat matching the skirt of the dress.

A featherweight woolen fabric, a printed silk, or one of the gorgeous new cotton fabrics would be the choice for making up this pattern. For the afternoon dress, a printed silk, trimmed with plain or a plain, dark silk trimmed with flesh or white cowl front would be most becoming.

Truly there is much that can be done to replenish the family's wardrobe, now while it can be made a pleasure instead of later when the pressure of work makes it something to be endured, rather than enjoyed.

Apron pattern No. 3328—sizes small, medium and large. 1½ yards of 36-inch material with 12 yards of binding.

Nightgown pattern No. 2505—sizes 16 years to 46 inch bust. 36 requires 3½ yards of 36-inch material. Embroidery transfer pattern in blue. (15 cents extra).

Dance set of panties and bandeau, No. 2861, sizes, 12, 14, 16, 18 and 20 years. Size 16 requires 1½ of 39-inch material for panties and ¾ yards of 39-inch for bandeau and bands.

Slip pattern No. 3237, sizes 16 years to 42 inch bust. 36 requires 2½ yards of 39-inch material with 3¾ yards of 2-inch banding.

Smock pattern No. 2721—sizes 16 years to 42 inch bust. 36 requires 3¾ yards of 40-inch material with ¼ yard of 27-inch contrasting.

Housedress pattern No. 2728—sizes 16 years to 44 inch bust. 36 requires 3½ yards of 39-inch material with ¾ yard of 39-inch contrasting and ¼ yard of 14-inch material for vestee.

Bloomer frock pattern No. 3410—sizes 2, 4, 6 years. Size 4 requires 2½ yards of 39-inch material with ¼ yard of 32-inch contrasting and 4¼ yards of binding.

Boy's suit pattern No. 2680—sizes 2 to 10 years. 8 year size requires 1 yard of 36-inch material for shorts, 1½ yards of 40-inch for blouse.

Jacket dress pattern No. 3003—16 years to 42 inch bust. 36 requires 4½ yards of 39-inch material with 1½ yards of 35-inch contrasting.

Dress pattern No. 2997—sizes 16 years to 42 inch bust. 36 requires 3¾ yards of 39-inch material with ¾ yard of 39-inch contrasting.

Any of these patterns may be obtained from Pattern Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Price 15c each.

DIBBLE'S FarmSeedCatalog

The leading American strictly Farm Seed Book of the year, illustrated throughout in colors, describing all that is newest and best in Alfalfa, Clovers, Grass Seeds, Oats, Corn, Barley, Spring Wheat, Peas, Soy Beans, etc., and Dibble's Officially Certified Seed Potatoes at prices you can afford to pay, is ready for distribution. It tells the truth about the Farm Seed Situation, and every farmer should have one before he buys a bushel of Seed this year. Send for your copy today. Catalog and latest complete Price List FREE. Address:

Edward F. Dibble Seedgrower,
BOX C, HONEOYE FALLS, N. Y.

Maule's SEED BOOK FREE

MAULE'S seeds will give you a blue-ribbon garden. For 54 years we have been selling vegetable and flower seeds to particular people. We test all seeds. They are full of abundant, vigorous life—guaranteed by a money-back bond. Super-quality at lowest prices. Write for your free copy of Maule's Seed Book.

WM. HENRY MAULE

255 Maule Bldg., Philadelphia, Pa.

Isbell's Seeds are Dependable

To get the greatest returns from YOUR GARDEN (market or home) you require dependable seeds. ISBELL'S (Bell Brand) Northern Grown Seeds are dependable—always. Raise vegetables for health and profit. Flowers for beauty and pleasure. ISBELL'S SEED ANNUAL quotes direct-from-grower prices on field, vegetable and flower seeds. It's FREE. Send today. ISBELL SEED COMPANY, Seed Growers 379 Mechanics St. (20) Jackson, Mich.

BURPEE'S GARDEN BOOK

In planning your garden, consult Burpee's Annual. It offers the newest and widest selections for growing more beautiful flowers and improved vegetables. Write for your copy today. It's free.

Time to Plan the Garden

Profit by Lessons Learned Last Year

GARDEN stuff is now resting in winter quarters and I am reminded of lessons the summer's work brought to us. First, perhaps, is the benefit we derived from having a State demonstration garden. Our County Agent and a State Extension Garden Specialist worked with us, giving us some needed advice and a few seeds, especially of varieties they wanted us to try out which were new to us and most of our neighbors. Chief among them, new gardeners that we were, was broccoli, beautiful to look at, easy to raise, and very good, we thought, and so did customers who tried it. Kohlrabi was another recommended vegetable and very good.

Bloomsdale spinach planted in July came on beautifully when the cool fall weather came. Next summer much space left vacant from early vegetable plantings will be used for it. Early tomato plants set out before Decoration Day proved a prey to late spring frosts and the next ones set made late tomatoes. Another time I hope to try the extension specialist's idea and pot the early plants, then set them into the ground when frost danger is past.

Fertilizer Pays

Fertilization with rotted manure and commercial fertilizer, and a good application of lime surely paid well, as our garden proved when compared with another patch not limed but which was considered very good ground. Early peas, beets, and carrots planted in the demonstration garden, ten days later than seed from the same package planted in the untreated plot were ready to use just a few days later and the quality was better.

A hand duster, even the smallest size, for dusting vines for bugs, is much better than attempting it by hand, but the two-quart size is best to buy as you will find if you buy a smaller one. Just one application of lime and arsenate of lead, mixed according to directions, did away with worm damage on cabbage, though I saw no difference when I used flour to mix with it instead of lime. I prefer wood ashes for mixing to dust for squash bugs. Why did the bugs prefer the large juicy squash vines to the tiny, tender cucumber and melon vines? I do not know but they left the cucumber vines almost alone and tried their best to eat up the squash. However, the duster and I beat them out. Next year I intend to plant a few squash seed in the cucumber rows for the bugs to feed on and then pull them out when bug danger to my cucumbers is past.

Southern grown cabbage plants proved inferior to our own home-grown Golden Acre plants in earliness and yield. The Pennsylvania State Earliana tomato demonstrated their worthiness in the list as an early tomato. Parsley, covered with a bottomless tin tub with a window frame over it, grew nicely until November 15. If I can make it I shall bank the tub with manure and see just how long I can keep it growing. I would do the same with my pansy bed and have a bouquet for Christ-

mas if someone would donate me the tub!

The past year is behind us, the drought, which threatened us and cut production is now almost a memory; at least, we hope it will not be repeated right away. Mistakes have taught us much that we hope to remedy another time; even the children have their plans for the clean sheet 1931 will give us to work on. Much we have been blessed, though many hopes were not realized. However, clothes and food for winter will not be the problem to us which they will be in many a poor city home. Hail to life in the country. I am with it for life, I hope, and even that statement makes me thank the Lord again that I am still here to mother my family when I remember a dear friend, scarcely older than myself, who just this month was laid to her Eternal Rest and left five little ones for some other heart to mother—COUNTRY MOTHER.

With the A.A. FRUIT GROWER

Unproductive Apple Trees

WE frequently get letters from readers who say that their orchard is not producing satisfactorily and asking us to suggest a remedy. There are, of course, a number of reasons why apple trees may fail to produce, but a close examination of the trees usually gives some idea as to the trouble.

First, of course, it may be possible that disease and insects are mainly responsible and if so a careful following of the spray program recommended in your state will remedy this trouble. Aside from disease and insects there are two general conditions where apple trees are unfruitful. In one case the trees are likely to look unthrifty and the leaves are yellow instead of having a deep green color. This indicates a shortage of nitrogen and such trees will respond to cultivation or to applications of nitrogen carriers.

On the other hand, trees are sometimes unfruitful where they show a very vigorous growth of leaves having a dark green color. This condition indicates an excess of nitrogen. Such trees are likely to have been cultivated and sowing a temporary crop early in the spring will tend to reduce the supply of nitrogen available for trees.

New Spray for Peaches

THE U. S. Department of Agriculture is experimenting with a new spray which promises to give commercial control of bacterial spot of peaches. This spray solution contains zinc and lime and is prepared by using 4 pounds of zinc sulphate, 4 pounds hydrated lime and 50 gallons of water. One pound of aluminum sulphate may be added as this helps to keep the material in suspension.

Tests carried on in southern Indiana and Arkansas have shown that six applications of the spray at intervals of two weeks beginning with the petal fall greatly decreases the damage from this disease.

Calcium Arsenate As An Insecticide

Is calcium arsenate ever recommended for use on orchards in place of lead arsenate?

THE experimental work that has been done up to date indicates that lead arsenate is a considerably safer insecticide for use on apple trees than calcium arsenate is.

Experiments show that the nitrogen in legumes turned under as green manure is more readily available for plant growth than that in stable manure.

RED RASPBERRIES

The most delicious of small fruits

Berries large, firm, quality good, very productive, ripens early, brings highest price on market. Perfectly hardy in temperature of 35 below.

All orders will be filled with plants, guaranteed true to name, certified free from disease, from the originator's farm, Prof. F. C. Reeves, Canadian Horticulturist, Prince Edward Island.

Send for Catalog and let us tell you more about this splendid variety that leading Farm papers and Experimental Stations have referred to so favorably.

Good strong plants, well rooted, \$1.00 per dozen, \$8.00 per 100, 25 or over at 100 rates.

The leading commercial varieties at greatly reduced prices.

Trees of genuine merit, strong, healthy, well-rooted, satisfaction-giving trees, that is the only kind we sell. This is the sort you can depend upon to give you the best results within the shortest possible time. Our catalog will tell you more about our products.

It's free.

KELLYS'
Certified
True to Name Fruit Trees

(Right) 45 BU. MORE CORN PER ACRE. Mr. Lanfer Litman, Claysville, Washington Co., Pa., displaying some of his splendid quality corn. He gives AGRICO the credit for his yield of 120 bu. of ear-corn per acre, when the local average was 75 bu. per acre. AGRICO for Corn paid him \$5 profit for every dollar invested. Read his letter, below.

(Below) INCREASED PROFIT \$86.25 AN ACRE. Mr. A. C. Oliver, Cobocot, Steuben Co., N. Y., who writes: "I attribute an increase of 115 bu. of potatoes per acre to the use of AGRICO. This extra yield shows me, at the present market price, an extra profit of \$86.25 an acre." (Nov. 3, 1930.)

"We Got \$5⁰⁰ For Every \$1⁰⁰ Spent for AGRICO"

(Above) \$1 A DOZEN MORE FOR BETTER QUALITY. These ladies are displaying some exceptional asparagus (Extra Fancy grade), part of a large 1930 crop which brought \$5.50 per doz.—\$1 a dozen above the price paid on the New York market for other best grades produced in this section. This crop grown with "AA QUALITY" Fertilizer on the Bloomfield Farms, at Tullytown, Bucks Co., Pa., made a record. Some of the stalks measured 1½ to 2½ inches in diameter and many bunches weighed 6 lbs. apiece.

(Right) 175 BU. PER ACRE. Mr. L. I. Wilson, of the well known Wilson Farms, Gainesville, Wyoming Co., N. Y., is a pioneer New York State certified seed grower. Last season he used "AA QUALITY" Fertilizer on 70 acres of potatoes and averaged 175 bu. per acre. (Sept. 24, 1930)

LAST season Mr. Lanfer Litman of Claysville, R. D. 3, Washington Co., Pa., grew 7½ acres of corn, which he fertilized with AGRICO for Corn. His crop yielded 120 bu. of ear-corn per acre when nearby crops yielded only 75 bu. Mr. Litman gives the facts in his letter:

"When we started using fertilizer five years ago, we used it only on the poorer parts of our crop-land until we found that the larger yields and the better quality crops produced, paid our fertilizer bill several times over.

"In 1929, we fertilized only the poor part of our corn field, and raised 25% more corn of better quality on the poor soil with fertilizer than we did on the better soil with no fertilizer. The corn started off quicker, had a better color on the fertilized part of the field, and we could see the difference all season.

"In 1930, we used your AGRICO for Corn. It gave our corn a quick start, and we had a good crop, even though the season was very dry. We figure that AGRICO paid us at least \$5.00 for every dollar we invested in it.

"We also used AGRICO on our garden crops with results equally as good as on corn: We have raised better cabbage, tomatoes and beans with AGRICO than we have ever raised before."—Lanfer Litman, (Nov. 10, 1930).

Thousands of other farmers use AGRICO to give them larger yields, lower costs and greater net profits. Read what others say on this page and decide now to increase your own income by using the right kind of fertilizer next season. There is a brand of AGRICO specially made for each crop.

Don't skimp on fertilizer; for when all is said and done it's the crop-producing power of the fertilizer you use that measures the size of your profit. Use the best fertilizer you can obtain, and use enough of it. Don't expect so-called "cheap" goods to give you the profits you want and the profits your hard work entitles you to.

There is a brand of AGRICO for each crop. See our nearest "AA QUALITY" Fertilizer dealer and place your order now. Know what it costs to grow your crops. Ask us to send you a copy of the new simplified crop cost blank. Use it and see for yourself how AGRICO reduces costs and increases net profits. Send the convenient coupon today.

B-B

Vitamized

LAYING MASH

COLD WEATHER and lack of green feed need not take heavy toll from your egg production. Absence of sunshine need not sap the health and vigor of your flock and threaten the hatchability of your spring eggs. You can escape these ravages of winter just as thousands of other poultrymen are doing by feeding B-B Vitamized Laying Mash.

Vitamins A, B, D and E are absolutely necessary to the maintenance of egg production and fertility, to body growth and vigor. B-B Vitamized Laying Mash has all of these vitamins in sufficient quantity to maintain flock health and high egg output, even during the dark, indoor days of winter.

All Necessary Vitamins

Ample amounts of the Growth and Vigor Vitamins A and B, the Sunshine Vitamin D and the Reproductive Vitamin E are assured in B-B Vitamized Laying Mash through such healthgiving ingredients as Milk Sugar Feed, Cod Liver Oil, Dried Buttermilk, Poultry Alfalfa Meal, Linseed Oil Meal, Meat Meal, Fish Meal and health-giving minerals, all in perfect balance.

B-B Vitamized Laying Mash is a feed of known results. In the hands of thousands of poultrymen it has been proved a producer of more eggs at less

cost. And so we guarantee that B-B will give you the *most eggs at the lowest feed cost*, that it is the most economical feed that you can buy.

Guaranteed Most Productive

Here is our offer. Ask your dealer for enough B-B Vitamized Laying Mash and B-B Scratch Feed to last one pen for 30 days. (Write us if your dealer can't supply you.) At the end of this time compare egg production, condition of the birds and the feeding cost. If B-B hasn't given you most eggs per dollar of feed cost take the empty bags and your figures back to the dealer and he'll return your money without question. Here is a chance for you to join the big, successful family of B-B feeders without risking a cent.

Valuable Poultry Book Free

Practical poultrymen tell us they have never seen so much good sound information as is packed into our 64-page book, "Making Poultry Pay a Profit," written by Prof. L. N. Gilmore, of Syracuse University. We would like to send you a copy free. Your name on a postal will bring it promptly.

Maritime Milling Co. Inc., Buffalo, N. Y.

Also included in B-B Guaranteed Feeds are Vitamized Chick Starter Ration, Vitamized Broiler and Grower Ration, B-B Scratch Feeds, and a full line of Dairy Feeds.

M-162

The Greatest Health Producing Element

We are glad to announce that Milk Sugar Feed, the greatest health-producing element ever added to B-B Feeds, is now included in B-B Vitamized Laying Mash. A recently discovered process permits solidifying Milk Sugar Feed from dried whey at low temperatures, completely preserving its full vitamin strength.

Milk Sugar Feed contains 75% lactose, nearly twice as much as is contained in Dried Buttermilk. This valuable element assists in the development of beneficial bacteria and the formation of lactic acid in the lower intestine, right where these guardians of health are needed. They aid the bird in overcoming harmful bacteria and intestinal parasites. The result is a sturdier body and a higher rate of egg production.

POULTRY FARMER

About the Feeding of Hens

By L. E. WEAVER,
 A. A. Poultry Editor

WOULD you like to have the whole art of poultry feeding expressed in one short rule? Here it is. Feed a complete ration and feed all you can get the hens to eat. That probably contains more than appears at first sight. In the next few weeks we will discuss some of the questions that seem to puzzle many of our readers, but when all is said we will find that it is all included in the above rule.

L. E. Weaver

There are really only two questions that are asked about feeding; what to feed, and how to feed it. These two questions are asked in a great many ways. Here are a few samples. What about all-mash feeding; does it work? How much green feed should I feed? Is morning lighting better than evening? Is buckwheat a good feed for hens? If I feed the grain in the hoppers or troughs instead of in the litter how will they get their exercise? How much cod-liver-oil is needed?

All these questions in one way or another ask the "what" or the "how" of feeding. And, of course, they are all important questions. I would like to make the point however that there is nothing mysterious or even very complicated about this matter of feeding. All we need to know is that the ration that we are feeding fulfills certain definite requirements (that is the "what"), and that we are inducing the birds to eat the last possible mouthful we can get into them. And that is the "how".

They Must Have the Raw Materials

In later issues we will discuss how one may know that the ration is right, and methods for increasing consumption of the ration. For the present let us consider some of the broad fundamental facts on which a profitable feeding practice must rest.

The primary purpose of feeding the hens is to produce eggs. The growing of birds for meat is an exception to this rule, but is not of anywhere near so much importance here in the East. The making of eggs can be likened to a certain extent to the building of a concrete road. The requirements for good concrete are gravel, sand, cement and water, all in certain definite proportions to each other. A lack of any one of these ingredients will stop construction entirely. And if the proportions are incorrect the quality of the concrete is injured. Of course, hens use other ingredients for the most part in building eggs, but the correct proportions, and particularly having *everything* present is just as important as it is in building concrete structures.

The contractor who is putting in a new road probably does not care whether the sand and gravel are delivered separately or in the same truck, so long as the proportions are correct. And if the day is not long enough to get the materials all hauled the trucks will work overtime, perhaps even by artificial light. Of course he won't do that if he doesn't have to. It makes the job cost more. But, on the other hand, it would cost still more to have the men and machines stand around idle waiting for materials. So we can't afford to have our hens in the unemployed class. If we can't get enough food into them in the daytime we will have to turn on the lights.

But we cannot carry this idea too far. Hens are machines, and marvelously efficient ones, but they are temperamental. Some machines seem to

Reviewing the Latest Eastern Markets

Milk Prices January Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Milk		1.70
2A Fluid Cream	1.86	
2B Cond. Milk		
Soft Cheese	2.11	
3 Evap. Cond.		
Milk Powder		
Hard Cheese	1.80	1.60
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for December 1929 was \$3.42 for 3.5% milk and Sheffield's \$3.22 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Continues to Fluctuate

CREAMERY SALTED	Jan. 23, 1931	Jan. 16, 1931	Jan. 24, 1930
Higher than extra	29 1/2-30	29	29 1/2-38 1/2-39
Extra (82 sc.)	29	28 1/2-	-38
84-91 score	25 1/2-28 3/4	25	28 1/4 30 1/2-37 1/2
Lower Grades	24	25	24

The butter market continues to fluctuate from day to day. Last week the market closed firm at 28 1/2c for creamery extras. On January 19 the market opened with floors fairly well cleared. However, liberal arrivals stirred up a little uneasiness for a time but this was over-ridden and trade closed steady. This forced the price up to 29c on Tuesday but freer arrivals and a slower clearance weakened the market considerably on Wednesday and the price of extras went down to 28c. When the price had reached 29c many buyers held off and the accumulated stock created enough pressure to cut the price. At the lower figure there was a broader buying activity and it was not long before Thursday's market found the price of creamery extras back to 29c. At this point many of the larger buyers did not operate and views as to the security of the market were varied. In spite of this mixed sentiment the market held firm on Friday, with values fully supported on the finer makes with intermediate and cheaper grades trending upward.

It is impossible to make any statement as to the possible trend of the market.

Fox Hounds Coon hounds & rabbit hounds, also young stock. Lake Shore Kennels, Himrod, N.Y.

Coon —Fox—Rabbit Hounds \$15-\$25. Skunk dogs & Setters \$10-\$20. Collie pups \$5. Hound pups cheap. **JOHN BILECKE, NORTH ATTLEBORO, Mass.**

For Sale 20 choice select coonhounds cheap on trial. Kevil Kentucky Kennel, Bfil, Kevil, Ky.

Flemish Rabbits Low priced and guaranteed. **JOHN HALL, Norwood, N. Y.**

The economic situation in New York City continues bad and we doubt very much if any appreciable price increase is going to help matters. Consumers are economizing at every turn and any increase is bound to create some backing up. The out of storage movement during the period from January 9 to 16 was almost one million pounds short of the storage reductions during the same period last year. However, our holdings are approximately five million pounds less than what they were a year ago.

No Change in Cheese

STATE FLATS	Jan. 23, 1931	Jan. 16, 1931	Jan. 24, 1930
Fresh Fancy	18-19	18-19	-17 1/2
Fresh Average			
Held Fancy			24-26
Held Average			23-

There is nothing new in the cheese market as far as price change is concerned. There is very little interest in fresh makes. Fortunately, offerings are not heavy and prices remain unchanged. Cured cheese is selling in small lots without much life to the trading.

Gathered	22	25	24

The egg market opened on January 19 with further weakness developing under heavy offerings. At the lower price buyers took hold with a little more confidence. At the same time the larger retail stores were beginning to move their prices down in line with the wholesale market. On that day closely selected extras were bringing 25c to 26c. Even this price was too much for the trade, for on Tuesday closely selected extras went down to 23c to 25c. The flood of eggs was too much even for the better buying interest that prevailed on Monday. The decline caused a number of cars of fresh eggs to be held off the market under shipper's instructions. On Wednesday the market took a brace due chiefly to speculative interest, and the withholding of a number of cars from the market. On Thursday some reaction set in for there was a very noticeable lull in the buying, especially of nearby whites. A sudden cut in the retail price of white eggs by some of the chain stores was said to be responsible for the lack of activity on the part of jobbers who were holding off because their small retail dealers were unable to compete with the chain cuts. On Friday the weakness continued due to the continuation of conditions that existed on Thursday. Independent retailers had to compete with chains and therefore had to shop around for cheap eggs. This stagnated some of the activity in the wholesale market and once more eggs are piling up.

The egg market is utterly demoralized. The competition between the producing sections is most severe. A flood of eggs is coming from practically every section. It was expected that the recent cold wave would check production. This has taken place in some parts of the West. However, it appears that Biddy is not to be denied for she is starting her spring lay in spite of Old Man Weather. It is true that some of the hatcheries are beginning to take out choice selections but even the hatchery business does not appear to be making any noticeable impression.

Live Poultry Market Up in the Air

GEESE			
	18-20	20-21	23-25

The live poultry market is pretty much up in the air this week and is at this writing. The main factor is the situation existing in the freight market. A considerable number of cars have failed to arrive up to a late hour and no one seems to know where we go from here. Every-

body has been working in the dark. This has operated against the fowl market particularly. Colored fowls have suffered most while Leghorn fowls have been in demand. Of late, there has been a very strong demand for pullets. The fact that Leghorn fowls and pullets are selling so well is a good opportunity for some poultryman to get rid of a lot of birds that would stand some culling. Express pullets this week have been selling a little off due to poor quality. Express pullets have been bringing from 24c to 26c for Reds and Rocks while Leghorn pullets have been bringing from 23c to 24c. Broilers are meeting a little better demand. Practically no Rocks are bringing less than 40c where they show any condition at all. Hen turkeys are bringing 35c to 40c. Old Toms are worth 30c.

Meats and Livestock

CATTLE—Steers very slow, fully 25c lower. Medium and good fed steers \$9.00-9.25. Cows and bulls scarce, steady. Common to medium cows \$4.00-5.25; low cutters and cutters \$2.00-3.50. Cutter to medium bulls \$4.50-6.25.

VEALERS—Scarce, steady. Good to choice \$10.00-13.00; medium \$7.50-9.50; cull and common \$5.00-7.00.

HOGS—Steady. Good to choice 160-220 lbs. \$8.75-9.00.

SHEEP—One load good to choice New York fed western lambs weak to 25c lower at \$9.75.

COUNTRY DRESSED CALVES—Receipts light to moderate during the week. Demand slow all through. Market closed steady and one cent up on tops and small weak and lower and not cleaning up. Fresh receipts per pound: Choice, 14-15c; fair to good 12-13c; small to medium 9-12c.

HOTHOUSE LAMBS—Receipts light to moderate all the week. Demand slow all through and for fancy only. Market closed steady. Good to fancy, each \$7.00-11.00; imitations, each \$3.00-6.00.

RABBITS—Receipts moderate during the week. Demand slow and carryovers daily. Market closed steady at 12-20c per pound.

HIDES AND SKINS—Calfskins, green trimmed, New York City, No. 1, 13c per pound, No. 2, 11c per pound; weights 9 1/2-12 1/2 lbs. No. 1, 1.60; 12 1/2-14 lbs. No. 1, 1.70 each; 14-18 lbs. No. 1, 1.90 each; 18 lbs. and up No. 1, 2.80; No. 2's butter-milks and branded proportionately less on foregoing weights; Deacons, 25-50c.

HONEY—Market steady. Per pound: Clover extracted, in bulk, white, 9-10c; amber 9-10c; buckwheat, extracted, in bulk, 8-9c.

MAPLE SYRUP—Market steady. United States Commercial Standard, graded and filtered per gallon: No. 1, 2.25-2.35; No. 2, 1.75-2.25; No. 3, 1.65-1.75 (Farmers run equivalent to No. 3) Sugar in casks, farmers run 20-25c.

WOOL—New York better fleece wool, unwashed, fine, per pound: 21-29c; 1/2 blood 21-28c; 3/4 blood, 22-27c; 1/4 blood 22-26c; low quarter blood, 22-24c; common and braid, 21-23c.

ROOTS AND HERBS—Wild Ginseng selling very slowly. Well dried, New York and Eastern States, per pound: \$10.50, cultivated Ginseng, according to quality 3.00-7.00 per pound for New York and Eastern States. Goldenseal: clean and well dried, New York and Eastern States, Per pound 90c; Goldenseal; Leaves and stems New York and Eastern States 10c per pound.

Potatoes Easier

The potato market turned draggy this week and prices weakened. Maines in 150 pound sacks dropped to \$2.85 to \$3.10, while Long Islands in the same package bring \$3 to \$3.25. Bulk goods per 180 pounds from Maine are quoted at \$3.35 to \$3.60 with Long Islands at \$3.60 to \$4.

Beans Easier

Most all varieties of beans have felt some easier tone this week although prices are not greatly out of line compared with previous quotations. Jumbo Marrows still bring from \$6 to \$6.75 with average at \$5 to \$5.75. Pea beans experienced a little easier feeling during the week but prices still continue at \$5 to \$5.75. As the market comes to a close Red Kidneys have

suffered a slight reduction, selling through a range of \$9.25 to \$10 with the outside price extreme. White Kidneys bring from \$7 to \$7.75 and Round Cranberries \$5.75 to \$6.50.

34% O. P. Linseed Meal	35.50	35.00	53.50

The above quotations taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Hay Prices Lower

More liberal receipts of hay at all terminals have enabled buyers to fill their requirements at \$1 to \$2 per ton under last week's market. Most of the supply has been of medium grade hay, mostly mixed. Straight timothy grading No. 1 and No. 2 has not been over plentiful. At the close the market was steady. Straw winds up dull, with oat straw at \$12 to \$13, rye \$13; wheat \$14.

To Make New York State Conservation Survey

A STATE-WIDE survey embracing every phase of conservation from animal propagation to river flow control was instituted recently by State Conservation Commissioner Henry Morgenthau, Jr.

The survey which is probably the first of its kind ever undertaken, is the outgrowth of a series of conferences between Governor Roosevelt and the new head of the Conservation Department.

The first direct action by the Conservation Commissioner was the appointment of a Conservation Advisory Council, composed of distinguished conservationists, who include outstanding legislators, educators, agriculturists, representatives of fish and game organizations, advocates of greater recreational advantages including state parks, and publists, all of whom have been active in the field of conservation over a long period of years. The first meeting of the Council was held at the Conservation Department on Thursday, January 22nd, at ten o'clock.

Commissioner Morgenthau has requested the following to act on this commission:

Henry M. Nicholls, President New York State Conservation Association, Lockport.
John B. Burnham, Campfire Club of America, Essex, N. Y.

A. A. Davis, President, New York State Division Izaak Walton League, Rochester.

William B. Greeley, Vice-President, American Game Protective Association, New York City.

William O. Dapping, President New York State Fish, Game and Forest League, Auburn.

Clarence L. Fisher, President New York State Forestry Association, Lyons Falls.

John G. Agar, President Society for the Protection of the Adirondacks, New York City.

John N. Carlisle, President Empire State Forest Products Association, Watertown.

Russell M. L. Carson, President Adirondack Mountain Club, Glens Falls.

Dr. Hugh P. Baker, Dean of the State College Forestry, Syracuse University.

Ralph Hosmer, Department of Forestry, Cornell University.

Senator Charles J. Hewitt, Chairman Legislative Reformation Committee.

Dr. Geo. F. Warren, Cornell University.

Fred J. Freestone, Master New York State Grange, Interlaken.

C. R. White, President New York State Farm Bureau Federation, Ionia.

Senator Geo. L. Thompson, Chairman Senate Committee on Conservation, Kings Park.

Assemblyman Ellis W. Bentley, Chairman Assembly Committee on Conservation, Windham.

E. R. Eastman, Editor American Agriculturist, New York City.

Arthur D. Heacock, President New York State Publishers' Association, Albany.

Farm News from New York

New Conservation Council Acts on Rural Problems--County Notes

ONE of the first acts of the new Conservation Commissioner of New York State, Henry Morgenthau, Jr., was to appoint a Conservation Council consisting of leaders of all the various organizations interested in reforestation, hunting and fishing, and conservation problems, together with representatives of agriculture.

This Council met with Mr. Morgenthau at the Conservation Department for the first time on Thursday, January 22nd, to discuss the many and varying problems that come under the head of Conservation, not the least of which are the relationships between sportsmen, campers, and farmers. This was the first time that such a Council has been organized to cooperate with the Department, and all those present were enthusiastic over the opportunity of working together to solve the problems of so much interest to every citizen in the State.

The Gypsy Moth Problem

For instance, there is the job of controlling the Gypsy Moth, one of the worst menaces of both forests and farm crops. The Council went on record urging most strongly that Congress provide a necessary increase in Federal appropriations for more intensive control measures east of the New York State line as a protection not only to New York State but to all states to the west and south which would be threatened in case the Gypsy Moth succeeded in passing the present barrier zone that has been maintained along the eastern border of New York State for the past seven years. That is, the moth is becoming prevalent in New England, but its western march must be halted.

Copies of the resolution were sent to the President of the United States, the Department of the Interior, Department of Agriculture, members of the United States Senate, and the governors of all the states.

In certain counties of the State, it is possible to obtain a license to get ferrets for rabbit hunting. The State, therefore,

was paying money to establish rabbits in certain sections, and granting licenses, on the other hand, to kill all the rabbits off. It was pointed out that the real purpose of ferrets is to put them in the hands of farmers and fruit growers to destroy rabbits when the rabbits become a menace to fruit trees.

The Council passed a resolution disapproving the unrestricted licensing of ferrets and recommended that the issuance of ferret licenses be left to the discretion of the Conservation Department, except that in cases when application of farmers and nurserymen showed the necessity, the Department should issue licenses. In other words, it is still possible for farmers and nurserymen to obtain licenses to get ferrets to destroy rabbits when necessary, but the indiscriminate use of ferrets by anybody will now be restricted.

Recommendations on Hunting Season

The Council recommended that the seasons on hares, cottontail rabbits, and pheasants shall open simultaneously; that the pheasant season shall be during the last six week days in October and the first six week days in November with a bag limit of two birds per day and not more than six during the season. It was also recommended that the rabbit season shall open on the same day as the pheasant season and close on January 31st, except that in the case of an abnormal increase of rabbits in a town or county, the Conservation Commissioner shall have the authority to extend the open season for hunting in that area.

One policy back of increasing the open season for pheasants is to decrease the number of hunters that have been abroad in the fields during the few pheasant hunting days that have prevailed under the present law. So many of these hunters have gone out to hunt on the same day that they have been a menace to one another and to farmers and livestock.

The proposed amendment to the Constitution which would permit the purchase

of land in the Forest Preserve counties outside of the boundaries of the Adirondack and Catskill parks was considered at length and was approved by the Council. It was thought that should this amendment to the Constitution be carried, it will make New York State one of the greatest reforestation sections in the world.

At the next meeting of the Council, to be held in February, the farmer representatives and representatives of sportsmen organizations in the Council will endeavor to agree upon new trespass regulations that will better protect the rights of both farmers and law-abiding sportsmen.

Farm Organizations Rally in Albany

ONE of the big weeks of the year in the agricultural calendar is the third week in January when many of the farm organizations of the State hold their annual or special meetings in Albany. The meetings include the annual gathering and old-time supper of the New York State Agricultural Society, the annual meetings of the State Dairymen's and State Breeders' Associations, and meetings of the separate breed organizations. The gatherings this year had the best programs and were the largest attended of any in many years.

The New York State Agricultural Society, founded in 1832, is the oldest going farm organization in the United States. It has been the leader for nearly a century in the farm affairs of the State and the nation. It founded and started many of the other farm organizations of the State and the New York State Fair. There came a time when the new organizations took over many of the functions of the old Agricultural Society, and it went into something of a decline. In recent years, it has had a most notable revival, however. It has been made the rallying point of other organizations in Albany once a year, and its old-time supper is something to talk about.

The Agricultural Society was instrumental in establishing the State Farm Museum on the State Fair Grounds, which

attracts the attention of thousands every year, and in preserving and emphasizing the implements and customs of farmers of early times, the Society has found its real job, and it does this job exceedingly well.

The supper this year was attended by several hundred leading farmers and legislators and was addressed by Governor Roosevelt, Lieutenant Governor Lehmann, and Commissioner of the Department of Agriculture and Markets, Berne A. Pyrke.

The business meetings of the Dairymen's and Breeders' Associations were better attended than they had been before in years. In fact, pessimistic talk of farm depression and hard times is conspicuous by its absence in meetings of farmers. Forgetting the past, they seem determined to pass on to what is ahead, with a determination to overcome all problems.

A full report of the business accomplished at the business meetings and at the banquets of the Agricultural Society and of the other organizations meeting during this week in Albany, will be published in American Agriculturist next week.

For Vocational Agricultural Students

SOME time ago we announced a news writing contest for high school students of vocational agriculture and said that we would pay \$3.00 for the best item published each month and space rates for all others published. The prize for January goes to Harold Palen of Hannibal High School for the item published in our January 3 issue.

The response to the contest has been excellent. However, most of the entries received are too long and we are asking that you restrict them to from three to five hundred words. Many of you, too, have sent articles rather than news. New things are happening every week. We suggest that you read our news page carefully each week to see the kind of item that we believe appeals to our readers. The fellow who wins is the fellow who sticks to it. Let's have your entries for February!

High-Lights of the Penn. Farm Products Show

By E. C. WEATHERBY,
Circulation Mgr., American Agriculturist

IMAGINE yourself in the center of a six acre lot, surrounded by some seven hundred different commercial concerns, and you would be with me in the center of the big exhibit hall at the Pennsylvania Farm Show, providing, of course, that you also put an imaginary roof on the lot. There is actually 9.6 acres of floor space under cover in the new building just dedicated at Harrisburg, Pa., in which was staged Pennsylvania's outstanding farm show and industrial exposition.

There were no public officials showing me around the show so what I tell you will be the things I actually saw and overheard in the six hours that were available to me on Monday, January 12, the opening day of the show.

I do want to say that to the officials of the show—and I heard the name of Bressler mentioned often—there goes great credit because at 9 o'clock Monday morning the show was in perfect arrangement, exhibits were grouped and conspicuously designated so that farmer or city man might quickly get the story that the exhibit was supposed to tell. The outstanding features were: first, the educational idea; second, attractive arrangement; and third, high quality of farm produce shown, notwithstanding that Pennsylvania suffered immensely from the drought.

Take the Corn Show. There was a total of 4750 ears of corn shown. Outstanding to me were the 50 different exhibits of 10 ear samples. The Potato Show was outstanding in that each exhibitor submitted 32 tubers in competition rather than a plate of five or six. It made a New Yorker feel at home to see Professor E. V. Hardenburgh, of the New York State College of Agriculture at Ithaca, judging potatoes.

Adjoining the large six acre floor space devoted to exhibits of all types of farm machinery, seeds, fertilizers and educational exhibits from the different departments of the commonwealth of Pennsylvania, we found the Livestock Judging

Pavilion and back of that stables for the horses and cattle and yards for the sheep.

Over each breed, there was conspicuously displayed a sign telling the name of the breed and by the pens or stables, were banners or cards giving the name of the exhibitor. In other words, in the Livestock Show, by just keeping your eyes open, you got the whole picture.

When I visited the Judging Pavilion, there were seven stallion colts in the ring being placed. It must be that many farmers have concluded that horses are essential to the future of agriculture. Later in the day, when I returned to the ring, I saw twelve Ayrshire heifers competing and it was a happy sight to me to see five of these heifers being exhibited by boys and girls around twelve to fourteen years old—real showmen in the making.

In the other end of the Judging Pavilion, we heard the clanking of horseshoes because the State Horseshoe Pitching Contest was being fought out. More people were watching the Horseshoe Pitching Contest than were following the placing of the ribbons on the livestock.

To the thirty-two state-wide farm organizations of Pennsylvania, to the retiring Governor, John S. Fisher, and to the State Farm Products Commissioners, individually and collectively, there goes all credit possible for conceiving the idea of staging this wonderful show in the central part of Pennsylvania in the winter time under one roof.

Surely the legislature of the commonwealth has been generous in making available nearly a million dollars which was used to construct the building that housed the exhibits.

I came away with the feeling that agriculture is making great progress these days and that we need to study our farmer and his individual problems, applying more of the things that we know that should be done and to spend a little less time talking about the depression because the way to better things is through better individual effort.

New York County Notes

CHAUTAUQUA COUNTY—Most farmers do little at this season beyond the regular chores and draw out the manure though a few of the more ambitious ones get up their wood. The rest of us either on account of age or disposition, hire it cut. The valuable timber has about all been cut off; nothing much is left but wood timber and a few sugar bushes. It seems a pity that so many fine sugar bushes have been sacrificed for lumber. It is something like killing the goose that laid the golden egg.

The Dairymen's League is holding meetings to put across their stabilization program. It looks like veal might be cheap later in the season. Farmers are doing a lot of grumbling about the price of milk and other farm produce, but there is no farmer bread line in this county yet, and we are all going ahead planning for another season the same as usual. Local prices are about as follows: Butter, 30c; eggs, 23c; milk price to farmers for sale in city, 5c a quart. League pool price for November 5% milk, \$2.17; hay, \$12. at barn; potatoes, \$1.00 a bushel; apples, \$1.00; cabbage, \$1.00 to \$2.00 per 100.—A. J. N.

ERIE COUNTY—The Chautauqua grape crop last year was valued at \$1,669,955. Under the direction of the Farm Bureau and State College of Agriculture, Genesee is the first Western New York County to launch a "Grow Paying Pullet" campaign. Briefly, those who sign up pledge themselves to follow six major points in the campaign which will continue three years. The aim is to lower the chick mortality rate and to grow pullets that will produce more efficiently and economically.

Olean is making plans to welcome and entertain more than 2000 delegates expected to attend the 67th annual convention of the New York State Grange beginning February 2.

White hennery eggs bringing 32c on the

Buffalo market. Hens in this section so far this winter seem to have been doing their part toward price raising by keeping production down, but without avail. Butter, 35c; potatoes, 90c to \$1.00.

SCHOHARIE COUNTY—The week of January 12, found farmers busy harvesting ice. We noticed that the majority of the ice was hauled on trucks. Water is still very scarce in many sections. Many farmers have to draw all the water for their cattle or else drive them to creeks. We hear much talk of well drilling. There has been quite a lot of snow and some good winter weather. Recent Tuesday noon addresses over W.G.Y. given by our own Schoharie County agriculturists, Jared Van Wagenen, Jr. and Ray F. Pollard, were interesting and instructive. Eggs are selling for 30c a dozen, butter for 35c per pound, beef, 10c to 12c per pound when bought by the quarter.—MRS. L. McM.

ORANGE COUNTY—Last week was one of unusual activity around the ice ponds of Orange County. The weather was ideal for harvesting and ice ranging from eleven to fourteen inches was gathered. Produce prices are running rather low. Eggs are selling at thirty to thirty-five cents.—R.H.

ONTARIO COUNTY—We have been having very fine winter weather thus far this month; not much snow and very little wind. Wheat is well protected with snow and it needs it as it got a very poor start last fall. Stock of all kinds seems to be doing well, better than the price when fattened for market. I know a man that lost the amount that would have paid his taxes this year, on a flock of fattened lambs sold this year. Times are very dull, except the spending of public money. Farmers will be cautious this season in hiring help and many will work less land. The only thing that is staying high is taxes. Farms are assessed more per acre than they would sell for.—E.T.B.

BABY CHICKS

KERR'S BABY CHICKS WILL NOT DISAPPOINT YOU NEXT FALL

ONLY chicks from heavy-laying stock become profitable egg producers. High egg yield is an inherited quality.

Kerr's baby chicks have a rich inheritance from birds that have made big records in the leading egg-laying contests. Our White Leghorns have official production records up to 304 eggs in a year. Our Barred Rocks have produced up to 277 eggs and our R. I. Reds have laid up to 300 eggs in 365 days.

The prepotency of the Kerr strains of baby chicks for high egg yields is a fixed quality. In addition to heavy egg production, they excel in correct breeding type and lusty vigor, and are available from stock tested for B. W. D. Send for Kerr's fully illustrated Chick Book and the prices, sent free upon request.

have this trait at times, autos on a cold morning, for instance. But hens are always that way. They are creatures of habit. They have their likes and their dislikes. A concrete mixer moved to a new location will start off again as good as ever. But a hen must usually have a long period of adjustment to her new surroundings before she can get under way. Hens are equally notional about their food. The first time they are offered buckwheat they will usually refuse it if they have never seen it before. Later they will eat it readily. Or when they are used to one kind of mash they are slow about accepting another that differs in taste, in appearance or is ground finer or coarser. This is a particularly important point. Good mashes are sometimes condemned because they were introduced too abruptly and judged too soon. Because the mash was different the birds ate less, production went down and before the hens could get used to the new feed and under way again the owner probably changed to still another brand. That is unfair to both the hens, the feed and to the owner's pocketbook.

We can conclude then that from the many available ingredients a great variety of rations may be derived, any one of which may fulfill the requirements of a good and complete ration. We can conclude too that any method of feeding is satisfactory which gets that ration into the hens in sufficient amounts. And finally we can conclude that having decided on the ration and the method we had better stick to it, at least until we have given it a good fair chance to show what it can do.

Our 260-egg trapnested strain is famous throughout the country for its large size, high production and vigor.

GEORGE B. FERRIS, 923 Union, Grand Rapids, Mich.

Seen at the Madison Square Show

WHILE there is but one Madison Square Garden Poultry Show, it must be admitted that the number of hens exhibited this year was not quite up to previous years. However, there was nothing lacking in the quality of birds or in trade exhibits. In addition to chickens, turkeys, pigeons, and rabbits, many manufacturers of poultry supplies were present to show the latest developments in housing, ventilation, feeding, hatching and marketing. In fact, to many visitors, the commercial exhibits are equally as interesting as the birds themselves.

During the show poultrymen and college professors from several states met to further consider the development of an organization to be called the "Northeastern States Poultry Council." This will be composed of at least one representative and probably several, from each of the Northeastern States. Representatives will be chosen from State College Poultry Departments, from the State Departments of Agriculture, and from the poultry industry.

The purpose of the organization will be to work together on all promotion and production problems which concern the poultry industry in the Northeastern area. The Northeastern Poultry Council will also act as a body which can speak with authority on problems concerning the industry. Among those attending the meeting were: Professor Thomas E. Rice, head of the Poultry Department, New York State College of Agriculture; Professor Harry Lewis, now Commissioner of Markets of the State of Rhode Island; and Professor W. C. Thompson of the New Jersey State College of Agriculture.

The Educational Program

During the poultry show, an educational program was carried on under the direction of Charles E. Cleveland of Eatontown, New Jersey, and Roy E. Pardee of Islip, New York. Each day from Thursday until Sunday, a full af-

A Settler's Social for Lincoln's Birthday

This Holiday Offers Occasion for Clever Entertaining at Home, Grange or Club

FEBRUARY, short on days, is indeed rich in party occasions, and Lincoln's Birthday furnishes the opportunity for a pleasant and novel social, for club or church society.

Invitations may be written on brown wrapping paper and worded as follows:

"We celebrate the birthday of a man of great renown,
So come here, please, in plain attire, (women folks in cotton gown.)

For Lincoln was an honored man, beloved by this our nation,
So let's go back to Settlers' Days, and have a celebration.

Popular Cowl Neckline

DRESS PATTERN NO. 2943 has as a contrast to its soft and graciously becoming cowl front, an ochre lace vest with cuffs to match. Transparent velvet, black canton crepe, the crepe woollens and crepe marocain would suit this model wonderfully well. The pattern cuts in sizes 16, 18, years, 36, 38, 40, 42 and 44 inches bust measure. The 36-inch size requires 3 1/4 yards of 39-inch material with 3/8 yard of 39-inch contrasting. PRICE, 15c.

And as the settlers when they moved, took treasures wrapped with care,
(Some flower roots, quaint needlework, a bit of earthenware)
So bring some thing, yet valued not, wrapped careful round about.
And what we plan to do with these-why come and you'll find out."

Below appears the hour, date, and place of the social.

The committee in cotton gowns (men in overalls) receive the guests while the phonograph plays old time melodies. (Incidentally, it's always a good plan to have music going, while the guests are arriving.)

Trading Treasures

When all have come, it is announced that "trading of treasures" will take

place, and the "settlers" may change as often as they wish until the whistle blows. Parcels must, meantime, remain unwrapped, until the signal for "stop swapping" is given. Then each person opens the result of the various swaps, and may find a flower bulb, an old pan, a china mug, or other "treasure."

Rail-Splitting

Lincoln was sometimes known as a "Railsplitter", so a railsplitting contest for the men is quite appropriate. Long strips of brown crepe paper about three inches wide, and equal to the width of the room in length, represent the rails. One end is fastened at one side of the room, and the men, stationed at the other, each receive an end of the crepe paper rail, and a pair of scissors. At a signal they start splitting the crepe paper "rails," and the first to reach the goal is rewarded with a Lincoln penny!

Old Time Games

Old time games as Charades, Dumb Crambo, and others are then introduced, and, as always, prove popular, while just before refreshments are served the men may take part in a

Log Rolling Contest

Smooth firelogs are brought in, one for each man, and they are requested to sit on the logs, putting the heel of one foot on the toe of the other. While

MODERNIZED CUTWORK DESIGN NO. 123 is very attractively stamped on fine grade cream oyster linen. The button-hole stitch is the only one used in working up this beautiful grape design in all white. Scarf, 18 by 45 inches, 65c; floss, 45c extra. Square center, 36 by 36 inches, 95c, floss 85c extra. Buffet set, 70c; floss, 40c. Order from Embroidery Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y.

thus balanced they must thread a needle. Of course, there must be a prize for the first "Log-Roller" who gets his needle threaded, and this reward could be a stick of candy, wrapped in brown crepe paper to suggest a miniature log.

Plain Living Refreshments

As "plain living" was the keynote of Lincoln's time, refreshments must be simple and substantial. The table may be covered with oil cloth, and illuminated by candles in tin candlesticks. Corned beef sandwiches may be supplemented by dill pickles, coffee poured in tin cups, and gingerbread or generous cuts of pie.—ELSIE DUNCAN YALE.

House Ferns

FERNS that have been growing in a common dwelling house during the winter months have been making a relatively slow growth. With the advent of brighter, warmer days, however, the ferns will grow much faster if they are given the proper treatment.

The ferns should be repotted in early spring in readiness for their possible increased growth, so that a good healthy growth can be made at that season. This type of plant is particularly fond of humus in some form. Leaf mold, well rotted manure, and peat moss have all proven satisfactory forms of humus to mix with a good loam soil for this repotting operation. One-third of the humus material to two-thirds of the soil will make a good mixture, while

a half-and-half mixture would be desirable if the soil used was inclined to be a heavy type that would bake easily.

In repotting, put a good amount of broken pot or other drainage material over the drainage hole in the pot so that it will not get plugged up and the fern get water-logged.

After the fern has been repotted and is growing well, light applications of

PURSE NO. B5533 is of black suede-like cloth stamped for simple colorful embroidery. The package includes rayon lining, canvas foundation, cardboard interlining and yarn for embroidery. It finishes in size 7 1/4 by 10 inches. Price \$1.00. Order from Embroidery Department, 10 North Cherry St., Poughkeepsie, N. Y.

fertilizer may be found beneficial at three to five week intervals.

Ferns should be given all the possible sunlight during the winter months, but partial shade during the extremely hot bright days of summer.

Paul Revere's Ride

IS there not a mistake in your notes on "Shrines of America" for January 10? You have printed as follows: "Rumor said the British troops would march inland from Boston. Paul Revere left his home one night and waited with his horse across the river for signal from the Old North Church, which would tell him how the troops would move. A lantern flashed in the tower; the troops would move by land."—But the poem says: "One if by land, and two if by sea." Well on in the story we find these words: "He springs to the saddle, The bridle he turns, But lingers and gazes till full on his right, A second lamp in the belfry burns."—W. A. GEORGE, Windsor, New York.

Keep the Spirit of the Old House

(Continued from Page 3)

should match the woodwork or the interior may be painted in brightly contrasting colors if the room needs a bit of livening up.

If furniture needs doing over, the first thing is to get rid of the coat of varnish or paint it has. This necessitates using a paint and varnish remover, followed by sandpapering, to make the surface smooth. A filler should be used, with coloring in it if desired. For black walnut, I use a paste filler and mix in a little burnt sienna to give a richer brown color. This filler is spread on, allowed to stand until creamy, then all excess carefully rubbed off. This is followed by two or three coats of spar varnish, the last one rubbed down to a mellow, dull finish with pumice and rubbing oil. This gives a table top that will stand hot dishes and will not spot if water is spilled on it.

If a table does not have wood with a nice grain, it can be lacquered or painted to good advantage; but one has to start with a good smooth surface. A cracked, grainy, rough surface is not smoothed by being coated over with paint. Sandpaper or scraping, both perhaps, will have to be done.

In using any paint, varnish or lacquer, the manufacturer's instruc-

tions should be followed carefully, for it is obvious that he has every reason to recommend only the best possible practices for the successful use of his product.

A New Book

"Speech Made Beautiful" by Helen Stockdell is a book of practical lessons in English diction. Since the art of correct speaking is a sure sign of culture, Miss Stockdell, a Virginian whose family training insisted upon right speech, has compiled this series of twenty lessons with drills to aid one in attaining the goal of correct use of our language. An introduction by W. Russell Bowie, pastor of Grace Church, New York City, expresses the hope that every seminary training men to preach, schools and colleges will use this book, not only for public speakers but for every one who wishes to master our rich English tongue.

Teachers training children correct speech would find this book very useful and any one seeking to perfect his own diction could see the drills much as a piano student does his finger exercises. Abingdon Press, New York City. \$1.00

The Flattering Capelet

DRESS PATTERN NO. 2889 has a new feeling in the tapering line of its smart capelet collar. Black canton crepe with this season's favored lace trim would be elegant for afternoon wear. The unique curved seaming of the skirt is very slenderizing. The pattern cuts in sizes 16, 18, years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4 yards of 39-inch material with 3/8 yard of 39-inch contrasting. PRICE, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with proper remittance in stamps (send no coin). Add 12c for one of the New Spring fashion catalogs and address to Pattern Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, New York.

Aunt Janet's Corner

Success Often Depends Upon Good Health

RECENTLY in one of the big New York papers was reported the fact that doctors at women's colleges find the most "amazing ignorance" among freshmen as to health matters, both physical and mental. At a conference of college doctors on student health, reports were given on results of tests given to students entering college to determine what they already knew about physical and mental hygiene, this in order to decide how courses of study should be arranged on those subjects. The greatest deficiencies were in the fields of exercise, ventilation, knowledge of food, infant welfare, mental hygiene and preventable diseases.

For instance, 21 per cent thought tuberculosis was hereditary, 28 per cent did not believe in vaccination against small pox, 15 per cent thought that colds were more easily transmitted by doorknobs than by droplet infection, 27 per cent did not know the proper room temperature, 22 per cent did not know the causes of mental or nervous breakdowns and 72 per cent believed that only good physical hygiene was necessary to remedy such disorders.

These are only a few of the questions asked the girls entering these two large women's colleges and, as I read what the girls had replied, I wondered how high many women in their own homes would score if called upon to answer the same questions. For instance, what is proper room temperature? What is the purpose of ventilation? How are colds carried from one member of the family to others? These are very practical, everyday matters that affect the health of every member of the family, and therefore, deserve real study. Furthermore, even little children can be taught to cover nose and mouth when they sneeze, and to avoid using drinking cups or other utensils which may spread the cold to others.

By the time girls and boys go to college, they ought to be able to know when a room is ventilated properly and make it as much a matter of routine as going to meals. Moist, fresh air kept at 68° or thereabouts is ideal. Knowing how to keep well often has as much to do with success in life as does being very skilled of hand or brilliant of mind. As I have worked with great numbers of people in their various jobs, I have observed that oftentimes the decision as to whether some one is kept on rests upon regul-

arity at work. The girl or boy who is often absent for illness or is draggy and half sick stands much less chance of success than the alert, vigorous one who is always there. The ideal to strive for is that the body be kept functioning like the perfect machine it should be. But it takes training from childhood plus all the information one can get in order to know how to do it. —AUNT JANET.

Tested Recipes

Mock Plum Pudding

ONE cup each carrots, potatoes and seeded raisins, 5 figs, and put all through food chopper. Add the grated rind of 1 orange, and ½ lemon rind, 1 cup sugar, 1 cup flour, 1 teaspoon soda, ½ teaspoon salt, 2 teaspoons baking powder, 1 tablespoon milk. Mix together thoroughly. Put in baking powder cans, a little over half way full, put on the lids and steam for three hours. Serve with lemon sauce, or hard sauce flavoring generously with nutmeg.

Spiced Apples

Make a syrup of 4 cups sugar, 1 cup vinegar and 1 cup water. Add 1 teaspoon whole cloves, and a handful of stick cinnamon, broken in short lengths. Use 12 medium-sized sweet apples, pare, quarter and core, and cook slowly in the syrup until done. Remove them from the liquid, cook liquid down quite thick and turn over the apples.

Apple Cakes

¾ cup fat
2 cups pulverized sugar
1 cup corn starch
2 cups flour
4 teaspoons baking powder
1 cup milk
½ teaspoon salt
1 teaspoon vanilla
5 egg whites stiff beaten

Cream fat and sugar. Add the other ingredients and mix thoroughly, folding in the egg whites last. Pour the batter in two large, greased tins. Cover the entire top of the batter with sliced mellow apples, sprinkle them over with more sugar and bake in moderate oven, until done. Cut in oblongs or in squares and serve it with whipped cream or cream and sugar.—CLARICE RAYMOND.

One whole egg may replace two yolks in salad dressing recipes.

Morning Glory Designs for Curtains or for Linens

WHITE dimity curtains embroidered in long Morning Glory motifs are very attractive. We have Morning Glory pattern, number M558, that includes six flower designs for breakfast cloth corners, chair seat, or curtains, six smaller corners for the napkins and two long horizontal patterns for sash curtains, valances or table runner. These designs are quickly done with heavy floss in naturalistic colors in outline stitch.

M558—Wax transfer Morning Glory design 25 cents; M558A—Pair Sash Curtains stamped, with floss \$1.40; M558B—Two Yard Length Curtains, with floss, pair \$2.00; Crisp White Dimity, yd., 25 cents.

Order from Embroidery Dept., American Agriculturist, 10 North Cherry Street, Poughkeepsie, New York.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR

That's why

FELS-NAPTHA IS THE THRIFTIEST WASHDAY BUY

Figure it out yourself! You buy soap to get help. Fels-Naptha brings you extra help. Extra help that makes washing easier. Extra help that saves you. And that's the wisest kind of washday economy!

Why does Fels-Naptha give extra help? . . . because it brings you two safe, busy cleaners instead of one. Naptha, the grease-dissolver, and soap, the dirt-remover, working together! Working through your clothes—dissolving stubborn dirt, coaxing it away—bringing you clean, airy-sweet clothes without hard rubbing on your part.

Fels-Naptha is easy on the hands, for it works quickly. And it also contains soothing glycerine. Fels-Naptha is gentle with your clothes. It keeps them nice-looking longer. Fels-Naptha works well any way you use it—in tub

or machine; for soaking or boiling; in hot, lukewarm, or cool water. Get a few bars at your grocer's today. Or try the 10-bar carton and have plenty of extra help for general cleaning, too!

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Dept. 1-1-31. Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR

FELS-NAPTHA

When Your Cough Hangs On, Mix This at Home

The best cough remedy that money could buy, can easily be mixed at home. It saves money and gives you the most reliable, quick-acting medicine you ever used. The way it takes hold of stubborn coughs and chest colds, giving immediate relief, is astonishing.

Any druggist can supply you with 2½ ounces of Pinex. Pour this into a pint bottle, and fill up with plain granulated sugar syrup or strained honey. It's no trouble at all to mix, and when you once use it, you will never be without it. Keeps perfectly and tastes good—children really like it.

It is surprising how quickly this loosens the germ-laden phlegm, and soothes and heals the inflamed membranes. At the same time, part of the medicine is absorbed into the blood, where it acts directly on the bronchial tubes, and helps the system throw off the whole trouble. Even those severe coughs which follow cold epidemics, are promptly ended.

Pinex is a highly concentrated compound of genuine Norway Pine, containing the active agent of creosote, in a refined, palatable form. Nothing known in medicine is more helpful in cases of severe coughs, chest colds and bronchial troubles.

Do not accept a substitute for Pinex. It is guaranteed to give prompt relief or money refunded.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David's latest escapade is the release of a crow that Perry Larson had captured by endless patience and staked out in the cornfield to keep other crows away.

David is lonely but a new friend eases this trouble. Blind Joe Glaspell, who plays the violin, arouses David's sympathy and he loans Joe his father's violin. Soon David makes another acquaintance, Miss Holbrook. He names her "The Lady of the Roses."

David meets "Jack and Jill" when they rescue him from a rough and tumble scrap with a gang of boys who are tormenting Jill's kitten.

David goes home with Jack and Jill. It appears that Jack and the Lady of the Roses are not on friendly terms.

As we left David last week he just entered unbidden the music room of his "Lady of the Roses."

David cannot understand the coolness between his Lady of the Roses and Jack. He enjoys playing his violin for Jack because Jack has many of David's old pieces that were lost when he and his father left their baggage beside the road.

"Yes, 'twas so heavy," murmured David abstractedly, his fingers busy with the pile of music before him. "Oh, and here's another one," he cried exultingly. "This is where the wind sighs 'oo-oo-oo' through the pines. Listen!" And he was away again on the wings of his violin. When he had returned Mr. Jack drew a long breath.

"David, you are a wonder," he declared again. "And that violin of yours is a wonder, too, if I'm not mistaken, though I don't know enough to tell whether it's really a rare one or not. Was it your father's?"

"Oh, no. He had one, too, and they both are good ones. Father said so. Joe's got father's now."

"Joe?"

"Joe Glaspell."

"You don't mean Widow Glaspell's Joe, the blind boy? I didn't know he could play."

"He couldn't 'till I showed him. But he likes to hear me play. And he understood—right away, I mean."

"Understood!"

"What I was playing, you know. And he was almost the first one that did—since father went away. And now I play every time I go there. Joe says he never knew before how trees and grass and sunsets and sunrises and birds and little brooks did look, till I told him with my violin. Now he says he thinks he can see them better than I can, because as long as his *outside* eyes can't see anything, they can't see those ugly things all around him, and so he can just make his *inside* eyes see only the beautiful things that he'd like to see. And that's the kind he does see when I play. That's why I said he understood."

For a moment there was silence. In Mr. Jack's eyes there was an odd look as they rested on David's face. Then, abruptly, he spoke.

"David, I wish I had money. I'd put you then where you belonged," he sighed.

"Do you mean—where I'd find my work to do?" asked the boy softly.

"Well—yes; you might say it that way," smiled the man, after a moment's hesitation—not yet was Mr. Jack quite used to this boy who was at times so very un-boylike.

"Father told me 't was waiting for me—somewhere."

Mr. Jack frowned thoughtfully.

"And he was right. David. The only trouble is, we like to pick it out for ourselves, pretty well,—too well, as we

find out sometimes, when we're called off—for another job."

"I know, Mr. Jack, I know," breathed David. And the man, looking into the glowing dark eyes, wondered at what he found there. It was almost as if the boy really understood about his own life's disappointment—and cared; though that, of course, could not be!

"And it's all the harder to keep ourselves in tune then, too, isn't it?" went on David, a little wistfully.

"In tune?"

"With the rest of the Orchestra."

"Oh!" And Mr. Jack, who had already heard about the "Orchestra of Life," smiled a bit sadly. "That's just it, my boy. And if we're handed another instrument to play on than the one we *want* to play on, we're apt to—to let fly a discord. Anyhow, I am. But"—he went on more lightly—"now, in your case, David, little as I know about the violin, I know enough to understand that you ought to be where you can take up your study of it again; where you can hear good music, and where you can be among those who know enough to appreciate what you do."

David's eyes sparkled.

"And where there wouldn't be any pulling weeds or hoeing dirt?"

"Well, I hadn't thought of including either of those pastimes."

"My, but I would like that, Mr. Jack!—but *that* wouldn't be *work*, so that couldn't be what father meant." David's face fell.

"Hm-m; well, I wouldn't worry about the 'work' part," laughed Mr. Jack, "particularly as you aren't going to do it just now. There's the money, you know,—and we haven't got that."

"And it takes money?"

"Well—yes. You can't get those things here in Hinsdale, you know; and it takes money to get away, and to live away after you get there."

A sudden light transfigured David's face.

"Mr. Jack, would gold do it?—lots of little round gold-pieces?"

"I think it would, David, if there were enough of them."

"Many as a hundred?"

"Sure—if they were big enough. Anyway, David, they'd start you, and I'm thinking you wouldn't need but a start before you'd be coining gold-pieces of your own out of that violin of yours. But why? Anybody you know got as 'many as a hundred' gold-pieces he wants to get rid of?"

For a moment David, his delighted thoughts flying to the gold-pieces in the chimney cupboard of his room, was tempted to tell his secret. Then he remembered the woman with the bread and the pail of milk, and decided not to. He would wait. When he knew Mr. Jack better—perhaps then he would tell; but not now. *Now* Mr. Jack might think he was a thief, and that he could not bear. So he took up his violin and began to play; and in the charm of the music Mr. Jack seemed to forget the gold-pieces—which was exactly what David had intended should happen.

Not until David had said good-bye some time later, did he remember the purpose—the special purpose—for which he had come. He turned back with a radiant face.

"Oh, and Mr. Jack, I 'most forgot," he cried. "I was going to tell you. I saw you yesterday—I did, and I almost waved to you."

"Did you? Where were you?"

"Over there in the window—the tower window," he crowed jubilantly.

"Oh, you went again, then, I suppose, to see Miss Holbrook."

The man's voice sounded so oddly cold and distant that David noticed it at once. He was reminded suddenly of the gate and the footbridge which Jill was forbidden to cross; but he dared

not speak of it then—not when Mr. Jack looked like that. He did say, however:—

"Oh, but, Mr. Jack, it's such a beautiful place! You don't know what a beautiful place it is."

"Is it? Then, you like it so much?"

"Oh, so much! But—didn't you ever—see it?"

"Why, yes, I believe I did, David, long ago," murmured Mr. Jack with what seemed to David amazing indifference.

"And did you see *her*—my Lady of the Roses?"

"Why, yes—I believe so."

"And is *that* all you remember about it?" resented David, highly offended.

The man gave a laugh—a little short, hard laugh that David did not like.

"But, let me see; you said you almost waved, didn't you? Why didn't you, quite?" asked the man.

David drew himself suddenly erect. Instinctively he felt that his Lady of the Roses needed defense.

"Because *she* didn't want me to; so I didn't, of course," he rejoined with dignity. "She took away my handkerchief."

"I'll warrant she did," muttered the man, behind his teeth. Aloud he only laughed again, as he turned away.

David went on down the steps, dissatisfied vaguely with himself, with Mr. Jack, and even with the Lady of the Roses.

CHAPTER XVI

DAVID'S CASTLE IN SPAIN

On his return from the House that Jack Built, David decided to count his gold-pieces. He got them out at once from behind the books, and stacked them up in little shining rows. As he had surmised, there were a hundred of them. There were, indeed, a hundred and six. He was pleased at that. One hundred and six were surely enough to give him a "start."

A start! David closed his eyes and pictured it. To go on with his violin, to hear good music, to be with people who understood what he said when he played! That was what Mr. Jack had said a "start" was. And this gold—these round shining bits of gold—could bring him this! David swept the little piles into a jingling heap, and sprang to his feet with both fists full of his suddenly beloved wealth. With boyish glee he capered about the room, jingling the coins in his hands. Then, very soberly, he sat down again, and began to gather the gold to put away.

He would be wise—he would be sensible. He would watch his chance, and when it came he would go away. First, however, he would tell Mr. Jack and Joe, and the Lady of the Roses; yes, and the Hollies, too. Just now there seemed to be work, real work that he could do to help Mr. Holly. But later, possibly when September came and school,—they had said he must go to school,—he would tell them then, and go away instead. He would see. By that time they would believe him, perhaps, when he showed the gold-pieces. They would not think he had—*stolen* them. It was August now; he would wait. But meanwhile he could think—he could always be thinking of the wonderful thing that this gold was one day to bring to him.

Even work, to David, did not seem work now. In the morning he was to rake hay behind the men with the cart. Yesterday he had not liked it very well; but now—nothing mattered now. And with a satisfied sigh David put his precious gold away again behind the books in the cupboard.

David found a new song in his violin the next morning. To be sure, he could not play it—much of it—until four o'clock in the afternoon came; for Mr. Holly did not like violins to be played in the morning, even on days that were not especially the Lord's. There was too

much work to do. So David could only snatch a strain or two very, very softly, while he was dressing; but that was enough to show him what a beautiful song it was going to be. He knew what it was, at once, too. It was the gold-pieces, and what they would bring. All through the day it tripped through his consciousness, and danced tantalizingly just out of reach. Yet he was wonderfully happy, and the day seemed short in spite of the heat and the weariness.

At four o'clock he hurried home and put his violin quickly in tune. It came then—that dancing sprite of tantalization and joyously abandoned itself to the strings of the violin, so that David knew, of a surety, what a beautiful song it was.

It was this song that sent him the next afternoon to see his Lady of the Roses. He found her this time out of doors in her garden. Unceremoniously, as usual, he rushed headlong into her presence.

"Oh, Lady—Lady of the Roses," he panted. "I've found out, and I came quickly to tell you."

"Why, David, what—what do you mean?" Miss Holbrook looked unmistakably startled.

"About the hours, you know,—the unclouded ones," explained David eagerly. "You know you said they were all cloudy to you."

Miss Holbrook's face grew very white.

"You mean—you've found out *why* my hours are—are all cloudy ones?" she stammered.

"No, oh, no. I can't imagine *why* they are," returned David, with an emphatic shake of his head. "It's just that I've found a way to make all my hours sunny ones, and you can do it, too. So I came to tell you. You know you said yours were all cloudy."

"Oh," ejaculated Miss Holbrook, falling back into her old listless attitude. Then, with some asperity: "Dear me, David! Didn't I tell you not to be remembering that all the time?"

"Yes, I know, but I've *learned* something," urged the boy; "something that you ought to know. You see, I did think once, that because you had all these beautiful things around you, the hours ought to be all sunny ones. But now I know it isn't what's around you; it's what is *in* you!"

"Oh, David, David, you curious boy!"

"No, but really! Let me tell you," pleaded David. "You know I haven't liked them—all those hours till four o'clock came,—and I was so glad, after I saw the sundial, to find out that they didn't count, anyhow. But to-day they *have* counted—they've all counted. Lady of the Roses; and it's just because there was something inside of me that shone and shone, and made them all sunny—those hours."

"Dear me! And what was this wonderful thing?"

David smiled, but he shook his head.

"I can't tell you that yet—in words; but I'll play it. You see, I can't always play them twice alike,—those little songs that I find,—but this one I can. It sang so long in my head, before my violin had a chance to tell me what it really was, that I sort of learned it. Now, listen!" And he began to play.

It was, indeed, a beautiful song; and Miss Holbrook said so with promptness and enthusiasm; yet still David frowned.

"Yes, yes," he answered, "but don't you see? That was telling you about something inside of me that made all my hours sunshiny ones. Now, what you want is something inside of you to make yours sunshiny, too. Don't you see?"

An odd look came into Miss Holbrook's eyes.

"That's all very well for you to say, David, but you haven't told me yet, you

Just David

(Continued from Opposite Page)

know, just what it is that's made all this brightness for you."

The boy changed his position, and puckered his forehead into a deeper frown.

"I don't seem to explain so you can understand," he sighed. "It isn't the special thing. It's only that it's something. And it's thinking about it that does it. Now, mine wouldn't make yours shine, but—still,"—he broke off, a happy relief in his eyes,—“yours could be like mine, in one way. Mine is something that is going to happen to me—something just beautiful; and you could have that, you know,—something that was going to happen to you, to think about."

Miss Holbrook smiled, but only with her lips. Her eyes had grown somber.

"But there isn't anything 'just beautiful' going to happen to me, David," she demurred.

"There could, couldn't there?"

Miss Holbrook bit her lip; then she gave an odd little laugh that seemed in some way, to go with the swift red that had come to her cheeks.

"I used to think there could—once," she admitted; "but I've given that up long ago. It—it didn't happen."

"But couldn't you just think it was going to?" persisted the boy. "You see I found out yesterday that it's the thinking that does it. All day long I was thinking—only thinking. I wasn't doing it, at all. I was really raking behind the cart; but the hours all were sunny."

Miss Holbrook laughed now outright.

"What a persistent little mental-science preacher you are!" she exclaimed. "And there's truth—more truth than you know—in it all, too. But I can't do it, David,—not that—not that. 'T would take more than thinking—to bring that," she added, under her breath, as if to herself.

"But thinking does bring things," maintained David earnestly. "There's Joe—Joe Glaspell. His mother works out all day; and he's blind."

"Blind? Oh-h!" shuddered Miss Holbrook.

"Yes; and he has to stay all alone, except for Betty, and she isn't there much. He thinks all his things. He has to. He can't see anything with his outside eyes. But he sees everything with his inside eyes—everything that I play."

FARMEX FACTS

The history of explosives dates back to ancient times. The first combustible mixture was discovered in the sixth century; Gunpowder was first made in the fourteenth century; in 1867 Alfred B. Nobel, a Swedish engineer, invented dynamite.

Since then progress in the development, manufacture and application of explosives to useful work has been exceedingly rapid.

FARMEX EXPLOSIVES

... were developed especially for farm blasting—one for ditching, one for stump removal, one for boulder disposal. To help increase crop output per worker on the farm is the fundamental purpose of these explosives. If interested in this use of explosives, write:

The Question Box

About Licenses to Sell Farm Produce

Yesterday I received a form letter from the U. S. Department of Agriculture advising me that I should get a Federal license allowing me to sell produce under the Federal Perishable Agricultural Commodities Act. I do not see why I should be required to get such a license.

SEVERAL letters similar to the above have been received. Recently, the Perishable Agricultural Commodities Act went into effect. It acts as an added protection to sellers of farm produce in that commission men and other buyers of farm produce who ship produce from one state to another, must take out a Federal license.

The U. S. Department of Agriculture tells us that letters similar to the one our subscriber received were sent out to individuals and firms listed in a commercial register and undoubtedly many received a letter who are not required to get a license under the act.

No person who sells only stuff he grows himself needs to get a license, nor any person buying or selling produce in lots of less than a quarter carload, but any person handling this produce in interstate commerce on commission in any quantity is required to obtain a license.

Making Lard Oil from Old Lard

"I have a quantity of lard that is several years old and not fit for kitchen use. Can you advise me how to convert this into lard oil for use in drilling and such purpose?"

ONE way is to put your lard in a thin sack such as cheese cloth or a flour sack after the starch has been washed out, and hang in a temperature warm enough to melt it a little, and set a pan under it, and you will get a good quality of lard oil. Has any reader a better method?—I. W. D.

A Good Snow Plow

"Can you or any of your readers tell me how to make a good homemade snow plow for opening country roads in winter. One that could be drawn by horses or fixed so that the horses pushed it? I have tried the one patterned after the capital A, but it doesn't give very good results in deep snow. Would appreciate any suggestions."

I THINK all of the home-made snow plows I have ever seen were of the A-type, similar to that shown in the diagram (D-679), which was sent in by one of our readers and which gave very satisfactory results. As shown is was pulled by horses; but it would be a simple matter to extend a pole backward and hitch the team so they would push it. For deeper snow, the sides of the plow should be built higher and extended back farther. Also if the plow is wider at the bottom than at the top, it will hold to the ground better in the deeper snow. However, if the drifts are very deep, these light home-made

plows are hardly strong enough and from four to six horses would be necessary for power. Usually some shoveling is necessary under such conditions. We should be glad to hear from our readers of any better types they have worked out.—I. W. D.

Waterproofing and Preserving Shoes

"Can you tell me what ingredients to use to make a good shoe dressing for waterproofing shoes? I have tried linseed oil, but that soon makes the leather too brittle; while lard does not last long."

MUCH valuable information on the selection and care of leather shoes will be found in Farmers' Bulletin 1523 "Leather Shoes", which may be obtained free from the Department of Agriculture, Washington, D. C. I remember as a boy we used tallow freely on our boots to keep them pliable and waterproof. This works pretty well in mild weather, but the tallow makes them stiff in very cold weather. A mixture of half tallow and half neat's foot oil melted together and applied warm (not hot) and well rubbed in with the hand makes a very good oil and it is fairly waterproof. If preferred castor oil or wool grease can be used in place of the neat's foot oil.

The above bulletin recommends for waterproofing 12 ounces of tallow and four ounces of cod oil; or one pound of petrolatum and two ounces of beeswax; or eight ounces wool grease, four ounces petrolatum and four ounces paraffin wax. Either should be melted together carefully and applied warm. The shoe should be set in a shallow dish and enough of the warm oil poured in to cover the entire sole and let stand 15 to 30 minutes. Rubber heels will soften and should be kept out of the grease.—I. W. D.

An Answer to an Unsigned Inquiry About Wet Mash for Hens

BECAUSE of the many inquiries we get on all sorts of farm subjects, we ordinarily cannot pay attention to unsigned questions. Every question, and by the way, we are more than glad to answer all questions to the best of our ability, receives a personal answer and only those which we feel will be of general interest to all subscribers are printed in American Agriculturist.

Recently, an unsigned letter came, asking what feed to use for wet mash for hens. This is of general interest and so we are answering it in our columns.

Where wet mash is fed it is almost always a usual dry mash mixed up with water to a crumbly consistency. Either the dry mash which is home-mixed, or any commercial egg mash can be used in this way. It is not advisable to mix it up with skim milk unless you definitely want to increase the protein content of the ration you are giving. That is, skim milk is high in protein and

added to the laying mash is likely to give the hens too much protein.

Seen at the Madison Sq. Show

(Continued from Page 12)

noon program was put on, including moving pictures of the poultry industry, and talks by a number of well known authorities. Among those who spoke were: Dr. J. G. Lipman of the New Jersey State Agricultural College; Dr. O. B. Kent, formerly with the New York State College of Agriculture and now with the Quaker Oats Company; N. H. Arndt of Kerr Chickeries, Frenchtown, New Jersey; W. H. Allen of the Acetol Products Company; A. R. Lee of the U. S. Department of Agriculture and J. M. Ludwig of Tioga Mills, as well as many others.

Boys' and girls' exhibits and contests occupied an important place at the show. This year Jacob Hartigh, a member of the 4-H boys' and girls' club of Millington, N. J., won the New York World trophy offered to the boy or young poultry raiser winning the most prizes. Hartigh, who is seventeen years old, won the cup with twenty-seven points. Mary T. Bailey, Wallingford, Conn., won the prize for the best pullet; Pauline Seaman, Farmingdale, N. J. for the best male bird; and Carl Weissman, Upper Montclair, N. J. for the best Rhode Island Reds.

One of the oldest exhibitors was Charles McClave who admits having won prizes with his hens at the Philadelphia Centennial Exposition in 1876. Mr. McClave is 81 years old.

With the Fruit Growers at Rochester

(Continued from Page 3)

farmers have been hard pressed to find food and have been taken care of by the Red Cross. When we get this picture in our minds I think we can all agree that we have much to be thankful for."

Other points mentioned by Mr. Hall were the importance of developing a better marketing program, the need for backing up the program of the Federal Farm Board, and the importance of increasing the use of shipping point inspection when marketing fruit. Mr. Hall called the attention of all those present to the place which the New York State Horticultural Society holds in the fruit industry of New York State. He expressed satisfaction because of the results secured by Governor Roosevelt's Advisory Commission and commented favorably on the appointment of Henry Morgenthau, Jr., as Conservation Commissioner and of Dr. Carl Ladd as Deputy Commissioner.

Two other speakers at the meeting were John Connor of Mt. Morris, who spoke at the banquet and told of his trip through Europe last summer, and Dr. G. F. Warren of Cornell, who reviewed economic conditions.

A tribute was paid to Dr. U. P. Hedrick, when by a unanimous rising vote, the meeting went on record as favoring "Hedrick Hall" as the name for the new horticultural building at Geneva.

With the A. A. RADIO MAN

In what way is a light socket type of aerial connector a "lightning arrester"?

Didn't know that it was—except possibly that it might be claimed to do away with the need for an aerial, in that way avoiding possible danger from lightning.

Will the telephone system make a good aerial, instead of the lighting system?

A possible connection can be made by standing the 'phone on a metal pan or plate, connected to the aerial post of the set. No actual connection with a wire should be attempted.

The Service Bureau

A Department Devoted to the Interests, Welfare
and Protection of A. A. Readers

Settles for Stolen Trees

Just before Christmas some men came, cut a number of Christmas trees without our permission, and drove away with them. We know who the men are. Is there anything you can do to help us? I am a widow.

WE referred this to Stephen McGrath, Captain of Troop D at Oneida. In a few days the report came back from Captain McGrath stating that Corporal F. H. Lyman and Trooper F. H. Donovan had interviewed our subscriber, then located the man she accused and he admitted having taken the trees. He promised that he would get in touch with our subscriber and pay her for them.

This should serve as a lesson to the thief who should feel himself lucky that our subscriber did not issue a warrant for his arrest. Our thanks go to Captain McGrath, Corporal Lyman, and Trooper Donovan.

A "Peculiar" Will

PERHAPS some of our readers will remember a little item we printed a few weeks ago concerning a fake perpetrated in the name of Andrew Drake. This Andrew Drake was claimed to be a peculiar old gentleman who left a will stating that sealed packages, valued at \$5 to \$10 each were to be sent to each of 3000 common peo-

ple. These common people received letters asking them to send 25c for postage to pay for having the packages sent to them. In our write-up we mentioned that Mr. John Mucha was connected with this deal. In fairness to Mr. Mucha we are printing a letter just received by him. It seems that Mr. Mucha was the unfortunate victim of a clever scheme. We admire his efforts to straighten out this mess.

Several weeks ago you published a write up in your Service Bureau concerning me and now I am writing to explain all.

It was stated that I was conducting a fake mail order scheme. Well, I want to say that I was far from being wholly to blame. I was approached by a stranger posing as James S. Salley, executor of a Mr. Drake of a nearby town. After some talk, I accepted this person's offer and gave him a down payment of a few dollars to assure him I would do as asked, to print and mail to the thousand addresses he gave me. The names were supposed to be heirs of this peculiar Mr. Drake. This Salley instructed me to ask anyone of the named town where Mr. Drake lived and there I would find the executor. So if he did not deliver the gifts, I was to mail out in one month. I was to call for them.

I was curious and investigated and to my utter astonishment I discovered I was tricked. There was no Drake or Salley in the town. I was left to face such a critical position I never again hope to face, but as soon as I could I paid back every cent I was asked for. I received very few quarters; I'm glad of that.

Please insert this in your Service Bureau as soon as possible and I thank you for the same. I will gladly reply to any questions.

Yours very truly,
(Signed) JOHN MUCHA.

About Inspecting C.O.D. Packages

I ordered some goods from a mail order house which they were to send C. O. D. On arrival the post master allowed me to look them over and as they were not satisfactory, I returned them. Now I understand that they are attempting to make trouble for the post master, saying that he did not have the right to let me examine these goods. Is this correct?

WE referred this matter to the Post Office Department to make sure that our information was authentic. We are informed that those who buy stuff on a C.O.D. basis do not have the legal right to examine the goods until after the C. O. D. charges have been paid. In other words, the proper procedure is to sign a receipt, pay the charges, examine the goods, and then if they are not satisfactory, take up the matter with the company from which you bought them.

What Boy Needs a Home?

IN the spring of 1926 we published on the Service Bureau page an item stating that W. H. Halstead of Orange County, would furnish a home for some boy who needed one. Mr. Halstead writes us that a young chap took advantage of the offer and has been with him for four years.

Now they wish to repeat their offer; namely, that some boy who needs a home, preferably one who is through school, can have a home with them. They want a boy who is honest, good to stock, and willing to learn. If any reader knows of such a boy who needs a home, we suggest that they have him write to Mr. W. H. Halstead, RD 1, Rock Tavern, New York.

Ever since I subscribed to the A. A. I have always read over your Service Bureau—never dreaming I would come to ask for help. When I did need help you were the one I thought of first. I heartily thank you for the service you have rendered me.

Poultry Feed
Conference Board.*

A COMPLETE CHICK FOOD

Just give them G. L. F. Starting and Growing Mash and water. That's all the food they need. And watch those chicks grow. For G. L. F. Starting and Growing Mash is a complete feed. It carries in correct amounts all the energy-yielding and body-building materials the chick can use.

Quality of protein, of first importance, is provided by a variety of sources—plenty of dried milk, high protein meatscrap, and white fish meal (dried by a process which preserves its full protein value). Chicks need these proteins to grow rapidly and feather well. And the rapidly growing chick is most disease-resistant.

All the vitamins from A to G are present in this mash. Most important are A, D, and G. Several feeds, including yellow corn meal and cod-liver oil, supply Vitamin A. The cod-liver oil used is reinforced in Vitamin D and is much more potent than regular cod-liver oil. It is tested on chicks before and after mixing in the feed. These tests prove that the oil provides a liberal amount of Vitamin D

in excess of requirements for proper mineral assimilation and rapid growth. The large amount of dried milk insures enough Vitamin G.

Fancy yellow corn meal (the entire kernel), wheat bran, wheat flour middlings, and pulverized, heavy, low-fibre oats provide the sources of quickly available heat and energy

needed by the chick from the start.

The mineral content is based on actual determination of chick requirements. Besides the minerals in such ingredients as dried milk, meatscrap, and white fish meal, ground limestone and salt are added. Accurate mineral content is of the utmost importance when chicks are growing rapidly with G. L. F. Starting and Growing Mash.

Millions of chicks are reared each year on G. L. F. Starting and Growing Mash. It is fed in both battery and colony brooding. For broilers, it is unexcelled. Chicks like this feed because it is freshly mixed from ingredients of highest quality. The favorable price of this mash and the rapid growth it produces will bring your birds most economically to maturity.

PRICE

G. L. F. Starting and Growing Mash is delivered to G. L. F. Agent-Buyers in the Syracuse freight rate zone at approximately \$50.00 per ton. To this price must be added the Agent-Buyers' handling charges.

A Look Ahead

Facts and Figures to Guide the Poultryman

By GILBERT GUSLER

Standard Farm Paper Market Analyst

THE poultry business suffered along with all other industries in 1930. Producers, hatchery men, poultry feed and equipment manufacturers, dealers and storage operators all were hurt. Egg prices at the farm during the last months of 1930 were the lowest at the corresponding time in fifteen years. Chickens, also, have sold at lower prices than in many years. Feeds have been cheaper, softening the effect of the lower prices for eggs and poultry for those who purchase most of their feeds, but dividends from the flock have been sharply reduced.

What happened in 1930 is now history, but a brief summary of the year will give us the background for a look ahead.

The 1930-31 egg year opened with production on a "boom" scale. Farmers had received good prices for eggs and especially for poultry in 1928 and 1929 and the general tendency was toward expansion of flocks. Hatchery operations were extensive early in the season, reflecting the increased demand for baby chicks.

As egg and poultry prices declined during the spring, however, farmers apparently changed their minds about increasing their endeavors. Hatchings fell off and more pullets than usual were marketed as broilers or consumed on the farm. On July 1, the number of young chickens in farm flocks was about the same as a year earlier.

Egg production last spring, as measured by receipts at the four leading markets, ex-

ceeded that of 1929. From January 1 to May 31, receipts were about 8 per cent larger than in the same months of 1929. In spite of declining prices, consumption was

winter, however, combined perhaps with an increased number of early pullets, caused heavier receipts than a year before in spite of lower prices. Dealers moved more eggs into consumption than in the last four months of 1929, but consumers did not take enough to offset the increase in both storage stocks and fresh receipts.

The huge surplus of held eggs failed to disappear. All through the fall and early winter it continued to exert a depressing effect on the market. On January 1, 1931, the surplus of shell eggs over a year previous amounted to 1,187,000 cases and that of frozen eggs was the equivalent of 560,000 cases more. Receipts continued liberal and the storage movement disappointing in the first half of January, 1931.

The poultry market labored under a large stock in storage at the start of 1930. Holdings totalled 141 million pounds, or 31 million pounds more than on the same date a year earlier. On March 1, the surplus over a year previous had mounted to 44 million pounds. During the first half of the year, about 13 per cent more dressed poultry arrived at the four large markets than in the corresponding period of 1929. In order to move the large supplies of fresh and frozen poultry, both wholesale and retail prices were forced down.

Consumers of poultry in the cities responded more favorably to lower prices
(Continued on Page 20)

A Program for Poultrymen

PRESENT egg prices are discouraging for poultrymen and the facts responsible for the situation, as presented by Mr. Gusler, are not encouraging for the immediate future. In such a situation the best course to follow is to face the facts, study them, and then decide what to do. It would seem that this is no time to expand your poultry enterprise, yet we are inclined to believe that neither is it a time, if you are breaking even, to get out of the business.

To the poultryman who has been making money in the past, we would suggest:

1. Buy the usual number of baby chicks, but if anything, buy even higher quality than you have in the past.
2. Reduce costs to the minimum, not by buying a cheaper ration, or by feeding less of it, but by culling out unprofitable hens and by reducing your labor costs to the lowest possible point.
3. In order to get the best price the market will allow, study the markets, grade your eggs carefully, and consider the possibility of selling at retail. Do not be fooled by the wholesale receiver who promises you more than the market will warrant.
4. Lay out a constructive plan for the future by which you can develop the efficiency of your poultry business and be able to cash in when prices improve.

low so that more eggs than usual were forced into storage. On August 1, 1930, 2.2 million cases more shell eggs were reported in storage than a year previous. In addition, stocks of frozen eggs were 25 million pounds more than a year before, equivalent to 710,000 cases of shell eggs.

Production during the summer and early fall fell below the corresponding period in 1929. Open weather in late fall and early

THE GENERAL PURPOSE TRACTOR MOVES INTO THE POTATO FIELD

Right: 50 acres of potatoes on the farm of Eugene Rich, Charlestown, Maine, planted with a John Deere Hoover Planter and cultivated with the John Deere Two-Row Tractor Cultivator and Hoe.

Below Left: An early cultivation with the John Deere Two-Row Tractor Cultivator.

Below right: Digging 8 to 10 acres a day with the John Deere and John Deere-Hoover Two-Row Digger. Farm of Geo. J. Brown, Presque Isle, Me.

Growers Achieving Excellent Results—Raise Better Crops at New Low Costs

THE John Deere General Purpose Wide-Tread Tractor has become strongly established in the potato field. Each new season sees more and more potato growers taking advantage of this modern way to handle their potato crop, growing more acres, with less help, and at lower costs than have ever before been possible.

What the John Deere Will Do

The John Deere General Purpose Wide-Tread Tractor is ideally fitted for all farm work within its power. It cultivates two rows at

a time at the rate of 20 to 30 acres a day.

It will pull a two-bottom plow, two-row planter with fertilizer attachment, two-row tractor-drive digger, and six-row tractor-power sprayer. Equipped with the John Deere Power-Driven Mower, it makes an efficient, fast-working mowing outfit.

Power Lift Does the Hard Work

This tractor has the famous John Deere power lift which operates with a touch of the foot whether tractor is in motion or standing still. There are no levers to operate. Stops are unnecessary at the row ends.

1931 Improvements

Several refinements in the 1931 John Deere make this tractor and its equipment of even greater value than before. These refinements include an improved air cleaner (air is now double-cleaned), double filtration of fuel, special combination oil filter, and pressure indicator, combination muffler and spark arrester, new crank case breather and ventilator, new radiator guard with adjustable radiator curtain and an improved governor.

Go in and inspect this tractor at your John Deere dealer's store. It is the only way you can appreciate its real value. Arrange with your dealer for a demonstration on your farm. If you will write to John Deere, Moline, Illinois, a booklet giving full information on the tractor and its equipment will be sent to you without obligation. Ask for booklet MR-61.

JOHN DEERE GENERAL PURPOSE [WIDE-TREAD] TRACTOR

for Potatoes and Other Narrow Row Crops

Some Points to Consider When You Buy Seed

SCIENTISTS have accumulated a vast store of knowledge about farming but there are still a few things that they do not know. For example, they cannot tell by looking at a seed whether it will sprout and grow or whether it lacks that indefinable quality which will cause it to develop into a new plant. For that matter, neither can they tell by looking at a seed what is contained in the way of heredity which may result in a bumper crop of a high quality or in a low crop of poor quality.

Seed buying time is about here; in fact, some of you may have already contracted for your season's supply. If you have not, there are a number of precautions you can take, which will safeguard your investment and insure the buying of products which are worth the money. Good seed usually costs more than poor, but here is one place where it will pay not to economize. A little additional cost on a bushel of seed may result in several bushels more at harvest time, and, in fact, may actually spell the difference between loss and profit.

Seed Laws Help

Because it is so difficult to be sure of seed quality, most states have enacted laws requiring that seeds be labeled with certain information. These laws do not require that the seed meet any particular standard but merely that it shall be properly labeled. Therefore, it is not sufficient for the buyer to see that there is a tag attached. The information on the tag must be read and studied before you can tell what you are buying.

There is another law which gives valuable information about seeds. We refer to the Federal Seed Staining Law which provides for the dyeing of imported alfalfa and clover seed. Imported alfalfa seed, other than that coming from Canada, and which is not known to be adapted for use in this country, is colored with 1% green. Imported alfalfa seed known to be unadapted to this country is colored 10% red. Alfalfa seed from Canada is colored 1% violet, which in this case is a mark of quality. The same color scheme is used on red clover seed.

There is, of course, some alfalfa and clover seed produced in this country which is not adapted to climatic conditions in the northern part of United States. If you buy alfalfa seed produced in the United States, it is important to buy from a firm which will guarantee that it was grown in a state where the climate is at least as severe as it is here.

What Variety?

There are an almost endless number of varieties of all farm crops on the market. Frequently some new variety will be introduced and all sorts of wild claims will be made about it. Many times this is not a new variety but merely an old one that has been made the object of an organized publicity campaign. Before you buy any of these crops that are going to revolutionize agriculture, we suggest that you write to American Agriculturist or to your State College or that you ask your Farm Bureau Agent, as to its merits.

Probably you and your neighbors are growing about the right variety already. If you try something new, we suggest that you start out on a small scale until you have demonstrated that the new variety is better.

With many farm crops, particularly the small grains, a lot of home grown seed is used. Where this is done we remind you that the fanning mill is still an important machine. Its constant use will remove most of the weed seeds and foreign materials as well as light kernels that are not likely to grow into profitable plants.

There is still one precaution that should be taken. Seed treatment is too big a subject to discuss in length, but, where scab or rhizoctonia of potatoes is serious, seed treatment with corrosive sublimate is a good insurance.

The G. L. F. Marketing Plan

A New Service for Better Handling of Farm Produce

I WISH to say emphatically that we do not expect the G. L. F. Marketing Plan to revolutionize the produce business in this territory. It will be a 5 to 10 year program starting with careful conservative experiments. Each forward development will have to rise on a foundation that is economically sound and cooperative in principle and fact.

The experiences of the many local and statewide cooperative marketing enterprises that have failed provide for us a laboratory of errors despite the fact that each was the result of earnest effort on the part of farmers who believed in co-operation and were willing to sacrifice for the benefit of industry as a whole. These Cooperative failures point time after time to high fixed assets and overhead with a seasonable crop or low volume. We would not be fit guardians of the G. L. F. capital if we did not heed those warnings and build on a sound principle. As I mentioned before, each unit must be prepared to live on 5 per cent of the volume of incoming supplies so that a crop failure cannot wreck the service unit.

Milk, the leading product of the farms of this territory, is already being marketed by a capable cooperative organization, The League. It is not necessary to concern ourselves with this problem.

Eggs produced by G. L. F. patrons now present a problem very similar to the milk situation a few years ago, and incidentally our six months experiment in handling eggs has taught us a basic principle which must be adhered to throughout the whole program. The G.

By J. C. CRISSEY

Vice-President, Cooperative Farm Service Management, Inc.

L. F. will not buy produce of farmers nor will they sell it for them, for several reasons: (1) We would not have the capital. (2) We do not have men trained to it. (3) We do not have the market outlets. (4) We could not standardize quality. (5) We would jeopardize our volume on incoming supplies by creating enmity. (6) We would

be jeopardizing capital which belongs to other farmers. (7) The development would not be cooperative.

For Fruits and Vegetables there is a wide field and much more risk than in handling cull cattle, wheat or hay and straw.

The Marketing Policy of the G. L. F. is as follows: Farm Service Agencies will not buy or sell any produce. They will pack and grade for the patrons or for the buyers on a unit packing charge basis. The grade and pack will be jealously guarded. There will be errors in packing for we must train all our men. When ready for market disposal will be made by the patron or buyer. The agencies will sell nothing. They will take no risk, neither will they speculate with the farmers produce. They carry no inventory or accounts receivable and will not need to increase their fixed assets appreciably. The service unit can exist whether they pack produce or not. If they do pack produce they will do so at a very low figure and any profit made on it will be a part of the Service units surplus and thus reduce the handling margins on incoming supplies.

The G. L. F. will bend every effort to improve the present outlets for produce, will counsel with the shippers, and do everything possible to build a cooperative outlet that means a greater return to the farmers.

Each Service Agency will perform the following functions:

1. Assist in improving the quality of produce to be marketed. At present New York State products do not enjoy a

(Continued on Page 8)

If the G. L. F. Marketing Plan or any other plan succeeds in improving egg prices, poultrymen need to learn that shipping eggs from stolen nests under the old barn is not likely to increase the consumer's desire to buy more eggs.

New England Tries to Solve Its Milk Problem

How The Suggested Central Marketing Plan Would Work

By HARRY L. PIPER

ECONOMIC conditions in the dairy industry in New England have again brought into the forefront of public attention a central marketing agency to handle all the milk in the principal markets and to stabilize prices. After months of preliminary work a definite proposal has now been placed before the milk marketing organizations of New England. If it is accepted by most of these dairy marketing agencies it will be in operation within a month or two. At the present writing its fate is hanging in the balance.

The name of the proposed organization is the New England Dairies, Inc. It is an organization whose members are the existing organizations. Unless nearly all of them sign the contract and become members the project will be dropped. It is the general opinion of the leaders that, while one or two of the co-operative milk marketing organizations might stay out without jeopardizing the whole plan, unless the membership handles a very large percentage of the available market milk in New England the proposed organization will fail to fulfill its purpose.

Organizations Compete With Each Other

The need for such a central marketing agency lies in the multiplicity of existing organizations. The New England Milk Producers' Association, a bargaining organization not owning any facilities for handling milk, controls about 70 per cent of the commercial milk of New England. About 3 per cent of this commercial milk is not organized. The remaining 27 per cent is handled by about 15 cooperative creameries located in Vermont. Some of these cooperative creameries own facilities for handling milk at the city as well as owning country plants. Most of these cooperative creameries were set up as butter making plants,

later getting into the cream market and finally into the fluid milk market.

The New England Milk Producers' Association operates on a surplus plan. Dealers to whom the association sells milk make a strict accounting of their sales and purchases and pay a composite price made up of the price for fluid milk, arrived at by negotiation between the sales committee of the association and the Boston dealers, and the price for surplus milk fluctuating with the butter price. The cooperative creameries sell to smaller dealers and to the wholesale trade. For some years their practice has been to offer milk at a half cent under the NEMPA price. Their justification for such action is in their claim that they get more out of surplus milk than the association gets. While the half cent difference has at times been a bone of contention in the market it has not often brought on serious difficulties.

Low Butter Market Brings Trouble

When prices of butter were relatively high the incentive to cut prices on fluid milk sales, in order to get more of the surplus disposed of in the milk class, was not great. With the lower butter prices the difference between Class 1 milk and Class 2 milk was so marked that many of the cooperatives began offering milk at considerably below the association prices in order to increase their sales of fluid milk and thus build up their price to their patrons.

Under these conditions a situation arose in which all these farmer controlled organizations, selling 97 per cent of all the milk, were engaged in a highly competitive warfare to see which one could reduce its surplus to the lowest point and thus be enabled to pay the highest price to its

patrons. In this warfare the NEMPA suffered as it was the price getter, not the price cutter. Some three carloads of milk which was formerly sold by dealers buying from the association was lost to the cooperative creameries because the creameries offered to sell at a lower price than the dealers could offer and still pay the association price. The loss of this milk automatically increased the surplus carried by these dealers and reduced the price to association members. These conditions became intolerable to all parties early last spring and after a sharp difference of opinion among the cooperative groups as to the necessity of a price change in May the commissioners of agriculture appointed a Milk Board to hear in an impartial way the differences of opinion and suggest a remedy.

Recommendations Made

The recommendations of this milk board included a producer organization and a dealer organization with a milk administrator to settle minor disputes between them. The New England Dairies, Inc. is the producer organization set up as the result of these recommendations. It has been carefully worked out by representatives of the various cooperative groups, including the NEMPA, the cooperative creameries and the State Department of Agriculture and the Extension service of Vermont. In developing the plan the Federal Farm Board was called in for advice and Tom Stitts of the Board assisted greatly in setting up the organization. It has the entire approval of the Farm Board as it is now worked out.

The general plan of the Central Marketing organization is that each existing producer controlled group should become a member. Each of

Thought for the Week

SOMEONE on the radio the other evening told of a visit to a home for the aged where there was an old country doctor ninety-six years of age. The visitor stepped up to the old man, and, holding out his hand, said, "Doctor, how is my pulse?"

The doctor quickly located the pulse, and then, after a moment, with a twinkle in his eye and in a high quavering voice, said, "You'll be all right in the morning."

For three-quarters of a century this man traveled through the bitter cold and drifts of winter and the storms and mud of summer to stand over the bedside of stricken fellow-creatures, and so often had he tried to cheer them with his hopeful expression "You'll be all right in the morning," that it has become second nature to him.

Sometimes when the big or small annoyances and tragedies of life become almost more than we can bear, it may help a little to pick up our stumbling feet, throw back the shoulders bowed with grief, wipe the tears from the eyes, and say, with the old doctor, "You'll be all right in the morning."

What a Country

DURING the Christmas holidays, President and Mrs. Hoover gave their son, Allen, who was home on his vacation, a White House party. The honor guest was Miss Fannie Homans, of Boston, niece of the Secretary of the Navy, Charles Francis Adams, and great-great-granddaughter of President John Adams.

She danced the first dance with Allen Hoover in the same East Room where her great-great-grandmother, Abigail, used to hang out the family wash. She also had the unique experience of having the first slice of cake from a plate used in the White House by President and Mrs. Adams.

Thus does America carry on its traditions.

The Master Farmer Banquet

JUST a note to express the hope again that you will be able to take a winter vacation and attend Farm and Home Week at the New York State College of Agriculture, beginning Monday, February 9th.

Among the many fine events on the program for the week is the American Agriculturist-Mas-

ter Farmer Banquet which will be held at Willard Straight Hall at 6:30 P. M., on Thursday, February 12th. Governor Roosevelt will make the awards to the Master Farmers and to six young people who have won achievement awards. Tickets for the dinner will cost \$1.75 and may be had by writing in advance to American Agriculturist, 461 Fourth Avenue, New York City, or, if any are left, they may be purchased on the day of the banquet in Roberts Hall or in Willard Straight Hall.

This School Tax Money Should Be Saved

THE school law of New York State provides for the handling by supervisors of school moneys received from the State in the form of State aid for the local schools. Before the centralized schools were established, the supervisors' compensation for taking care of this money and paying it out did not amount to a very large sum, but with the increased State aid to the central districts and also to the one-room schools, the moneys from the State handled by the supervisors have very greatly increased to large sums.

These moneys are handled by supervisors on a fee basis, with the result that supervisors in some instances are paid hundreds of dollars for a little labor and for labor that is absolutely unnecessary, for it is not necessary that the money should pass through the supervisors' hands at all.

It is obvious that this situation should be corrected. Supervisors are, as a whole, rendering a real public service. It is also true that in general they are not overpaid for their services. Therefore, we believe that these men will be the first to approve a change which will result in the saving of public money.

New Compensation Law Unjust to Farmers

"I would like to have you advise me as to any new laws that affect the insuring of men hired by farmers to cut hard wood. A report has been circulated that any farmer who may hire one or two men to cut wood must have them insured. The result is that farmers are canceling orders for wood, and men who depend on wood-chopping in the winter are out of work and suffering."—H. E. D.

WE will answer the above letter in part by quoting from another letter on the same subject. We are in full sympathy with the points made in this letter. The present compensation insurance regulation is plainly unjust to farmers and should be corrected.

"On January 1st a new Workmen's Compensation regulation became effective, which promises to be disastrous to Upstate New York. This regulation provides a minimum premium of not less than \$231.00 for compensation policies that include insurance for sawmills but not for logging and lumbering, and a minimum premium of not less than \$375.00 for policies that include insurance for logging and lumbering. These minimum premiums are not subject to reduction on short term policies, or in case of cancellation by the insured. There was a prior regulation somewhat similar but with a lower minimum premium, which became effective October 1st, 1929.

"These regulations are made by the Compensation Inspection Rating Board, which consists of representatives of some 80 insurance companies doing a compensation business in New York, subject to the approval of the State Superintendent of Insurance. The fact that the regulations mentioned above are now in effect shows that the Superintendent of Insurance has approved the action of the so-called Compensation Inspection Rating Board. If our winter business in Upstate New York is not to be paralyzed, and if we are not to have the worst reign of unemployment that has ever been seen in this section, the State Superintendent of Insurance should reconsider his approval.

"President Hoover, through Colonel Woods, calls upon the 6,000,000 farmers of the nation to furnish work for the unemployed, who return to the country from the city. Outside of manufacturing centers, there is practically no work which can be given to such men by farmers or others, except the work thus penalized by the Compensation ruling. Neither the farmers nor the small sawmills will pay the minimum premium, and therefore our local labor will go hungry. Our chief winter industry shut down tight, northern New York will go into hibernation.

"Even if the city men, representing the Casualty Companies were not well enough informed to under-

stand how such a regulation as they have made would aggravate the unemployment situation, our State Superintendent of Insurance should have known. He is presumed to come into closer contact with the people. If for no other reason, he should have opposed regulations of this character on the ground that the burden was put on that part of the population least able to sustain it. It adds nothing to the burden of the few big jobbers and the large producers of lumber, but it is absolutely prohibitive for the farmer who employs labor and for the small mill owner. And it virtually puts them out of business.

"The officers of the State Insurance Fund at Albany have no suggestions to make as to a feasible way to keep men employed, who are dependent upon this class of work. As a result, the small sawmills are closed down, and little if any logs, pulp and cordwood are being cut. State Insurance Fund officers do not like the regulation and had nothing to do with its making, but they are obliged to enforce it according to the letter of the law, made, presumably, by the delegated authority of the Legislature. It is a question whether the Legislature has not exceeded its constitutional power in delegating the rate-making authority, which has the power in law, to an association of private individuals, who are thus enabled to make rates for their own profit, or at any rate on a basis that will insure them against financial loss. Apparently the new provision requiring the rule of the State Superintendent of Insurance is more or less prefatory.

"What argument can be advanced in favor of minimum rates, in view of their cruelty to the small man? He is already penalized by higher premiums as compared with the big operator and it is un-American to assassinate him through prohibitive minimums.

"It is to be hoped that the State Superintendent of Insurance will reconsider his approval of such arbitrary and uncalled-for minimum rates, as otherwise there will be little, if any, opportunity for employment in the rural sections of the State."

—JOHN B. BURNHAM.

Two Good Marketing Jobs

NOT in a long time have we published more interesting or more valuable market articles than the two in this issue, one by Mr. Piper on the New England milk situation and the efforts that are being made to solve the New England dairyman's market problem, and the other by Mr. Crissey on the new plan of the G. L. F. in this State to help farmers sell their produce.

While the plan is not fully accepted as yet, it would look as if the New England farmers were about to accomplish what New York dairymen fail to do—that is, unite all of the dairy marketing organizations in a working, practical federation, eliminating the foolish and expensive competition in the sale of milk that results in a loss to everybody concerned.

It may also be said that no greater problem exists in New York State than to find better marketing outlets for eastern-grown products, and it looks to us as if the G. L. F. was laying the fundamentals of practical policies for solving this problem.

Eastman's Chestnuts

HERE is a handful of worm-eaten Chestnuts, some of which gave me a snicker and some a snort. Maybe they will you.

A deaf old lady went to live near one of the naval ports. Shortly afterward a salute of ten four-inch guns was fired. The old lady, who lived alone, got out of her chair, smoothed down her dress, patted her hair, and said sweetly, "Come in."

* * *

Traffic Cop: "Let me see your license."

Tourist: "Marriage, car, driver's, campfire, fishing, or hunting? Open the license trunk, Maria." (More sense than nonsense in this. We are licensed to death.)

* * *

Mrs. Tellit: "Cousin Dorothy, you know, always wanted to have a little baby daughter so she could name her 'June.'"

Mrs. Askit: "Yes. Did she do it?"

Mrs. Tellit: "No. The man she married was named 'Bugg.'"

A New Land Program

EDITOR'S NOTE: The following address was delivered by Governor Roosevelt at the annual old-time supper of the New York State Agricultural Society, held on January 21st at Albany.

It is a well-known fact that practically all of the farmers' marketing troubles are caused by the surplus. If it were possible to take the land out of cultivation in every State, that can no longer be farmed at a profit, it would solve the surplus problem. This is only one of the many advantages which might result from a land program such as suggested by the Governor, in the most interesting address which follows:

TONIGHT I am going to talk to you about what the State has done for the farmers during the past two years. I am only going to say that the splendid program of actual accomplishments has been put through only as a forerunner of a much bigger and more vital policy of the State. Indeed, all of the study and work of the Agricultural Advisory Commission has emphasized the need of tying the various steps already taken into a bigger and more comprehensive whole.

The time has come when, in my judgment, the State can lay the cornerstone of a land policy—something that has been done by no other state in the Union; something which is needed by modern civilization and by the social and economic advances made by the present generation.

The big question is, what are we going to do with the land area of the State? No one has ever asked this question before; no one has ever answered the question:

How Our Land Is Used

First of all, what is the land area? About 30,000,000 acres. Of this, about 3,000,000 acres are used for cities, villages, residential and industrial purposes. That leaves 27,000,000. About 5,000,000 acres are today in mountains, forests, swamps and other lands that have never been cultivated. That leaves about 22,000,000 acres which were once in farms. Of this about 4,000,000 acres have been abandoned or are no longer used for farm purposes. This leaves about 18,000,000 acres now in farms.

The obvious first question in regard to this farm land is how is it being used for farming, and the first step has been taken to answer that question. Last year the Legislature passed, on the recommendation of the Agricultural Advisory Commission and myself, an appropriation for a survey of our agricultural resources, the amount of the appropriation being \$20,000, though I asked for \$96,000.

However, with this \$20,000 the College of Agriculture at Cornell University has started several important projects in a study and evaluation of the land resources of the State. As a part of this study, a survey has been made of one whole county, Tompkins County. Very simple and clear maps have been prepared covering every 10 acre square in Tompkins County and showing the following:

- The type of soil.
- The climate, that is the length of growing season between killing frosts and the amount of annual rainfall.
- The present use of the land, that is, whether it is forest land and swamp land or improved land, whether in pasture, in hay, or in annual crops and if so, in what crops.
- Who lives on the land, or owns it and how the owner uses the land, that is, to make his livelihood out of it, or to occupy it only as a home while working away from the farm in the city or elsewhere.
- An analysis of the people who live on the land; whether they are old people who have always been there, or new people who have recently come; whether they are Americans or foreigners, whether the young people are staying on the land or leaving it; whether the cultivation of the farm

By FRANKLIN D. ROOSEVELT

Governor of New York State

is supporting the farmer in accordance with an American standard of living.

- A measure of the contribution that each farm makes to the food supply of the nation.

Much Poor Land in Farms

The outstanding net result of this survey proves that a very high percentage of the land now in cultivation has no right to remain as farm land. Several generations of farm experience indicate that farmers cannot make a satisfactory living from this land. This percentage runs as high as 22 per cent. of the farm land in some of the townships in Tompkins County.

Using all of these data and bringing to bear upon the problem what we know about trends in population, demand for farm products, and the use of larger, modern machinery, there begins to evolve a real plan for the proper development of the land, in other words, a land policy for the State of New York.

This study of Tompkins County includes a classification of the land in the county into several groups with first-class land that should always remain in farms at one end of the scale, and land that clearly should be reforested at the other end of the scale.

A road system to serve the best interests of these areas is projected on a scientific basis. The plan indicates the roads which should be main thoroughfares and improved accordingly; those which may be a part of the secondary hard road system, narrower and cheaper but out of the mud; roads that should be kept open only as fire breaks and trails to enable people to reach the reforested areas.

Plan for Power Lines

The plan also includes a location for electric power lines such as will serve all people of an area and not leave some worth-while farms in pockets which can never be economically reached by electricity. You will see that this plan contemplates two things—the development of the best soil areas to the highest possible degree with the objective of ultimately providing farm to

market roads and electrical power to practically all the farms that should be maintained as economical farm units and as rural homes. The plan also contemplates removing from agriculture and putting to their proper use those soil areas which through this scientific survey and through the experiences of generations of farmers have been shown to be unsuited for farming.

Hand in hand with this survey there should go a reforestation program on a scale that has never before been attempted by any state or nation. These abandoned farm areas are today a blight upon our agriculture and a great state liability. Year by year they become poorer and poorer through erosion, the depletions of nature and uneconomic use. If put to their proper use, the growing of trees and the furnishing of recreational opportunities, they will again become a great state resource of wonderful value to our future New York. I assume that the Hewitt amendment providing for the greater state program in reforestation will again be passed by the Legislature this winter. I hope that the people of the State next fall will ratify this proposed constitutional amendment which

will make it possible for a great reforestation program to develop.

A scientific land policy will save the State money in that it will remove the necessity for the upkeep of thousands of miles of road. It will prevent the wrong location of electric power lines. It will help to develop a great agricultural industry in the regions best adapted for farming. The work that has been begun in Tompkins County should be extended to all the other counties in the State.

We have proven to our satisfaction that there are large areas in the State of New York where people are attempting to maintain farms without any economic or social justification for maintaining them. I use the word social as well as economic for the very good reason that the continuance of the maintenance of these farms proves a drag on the social development of our rural life, for the very good reason that the families that maintain and operate these farms cannot make a success of them and must necessarily fail to obtain the social advantages and live up to the social standards which we ought to give to all our population.

This, I call, the beginning of a real land policy for the State of New York. As leaders of agriculture and of farm thought in the State, I report it to you and commend it to you for your study.

Higher Taxes for Commercial Vehicles?

By J. M. HURLEY

EDITOR'S NOTE: A short time ago we published an editorial urging the passage of a bill introduced by Assemblyman Charles P. Miller to decrease the registration fee on farm-owned trucks, and time and again, we have gone further than this and urged that the license year should be shortened for both trucks and automobiles owned by farmers who cannot use these vehicles during the winter time because of bad roads.

We are in constant receipt of a large number of letters from farmers who keenly feel the injustice of having to pay taxes from which they receive no benefit. We certainly hope that the Legislature this year will pass a three-quarter of a year license law as a measure of plain justice to people who can only use their automobiles or

trucks for three-quarters of a year or less.

Among the large number of letters we have received on this subject is the following one by Mr. Hurley, which is so much to the point and so right in its conclusions that we are passing it on to our readers. Certain it is that the great, heavy trucks wear out the roads and therefore they should do their part toward paying for them. Here is Mr. Hurley's letter:

COMMENTING on the discussion of Assemblyman Miller's proposal to decrease the registration fees on farmer-owned trucks used exclusively in the transportation of the owner's produce, I wish to assure you that I find myself in full agreement with the principle. In fact, most other states in their motor vehicle taxing policy favor privately operated vehicles over vehicles operated for hire.

However, since the present revenues derived from all motor vehicle taxes in New York State do not provide more than half the money spent each year on our highways, it seems to me that any proposal to reduce the taxes on any class of motor vehicle should be coupled with a plan to increase the taxes on heavy motor vehicles operated for hire. In 1929 according to Commissioner Brandt's annual report (pages 73 and 75) New York State spent \$52,108,164.29 on new road construction and for reconstruction and maintenance besides approximately \$50,000,000 which was expended for the maintenance of town highways and county roads. In the same report he states (page 71 & 72) we are permitted to close weak roads to loads exceeding 4 tons in weight. Many hundred and probably some thousands of miles of our roads are thus closed each spring. This closure is responsible for saving in the aggregate over a number of years many millions of dollars. In spite of it, however, some vehicles use them and it only takes a few such vehicles on a weak road in the spring to cause thousands of dollars of damage. This was illustrated only a few years ago when a few lumber trucks destroyed in a few days roads which cost about \$500,000 to rebuild. The roads had formerly been in excellent condition and it was thought they were good for many more years of service.—We are always faced with the fact that we have thousands of miles of old road not designed to carry the loads permitted by statute. When these roads are badly broken their value as a founda-

(Continued on Page 14)

The Song of the Lazy Farmer

MY NEIGHBOR says we all should seek to learn some things at Farmers' Week, he says. Each year he learns some facts that make him modify his acts, the things that science learns, by gum, he puts in practice there to him. He says experiment stations can make each of us a better man, by teaching us efficient ways of growing grains and curing hays. The time we spend there isn't lost, they teach us to reduce the cost of all the products that we grow, if we produce them cheaper so that our expenses ain't so rank we may put money in the bank. At any rate, it's well worth while to keep up with the latest style of farmin', for the more we know about the ways to plant and sow, the more we save our arms and backs and get the cash to pay our tax.

I tell my neighbor that, gee whiz, the trouble with his ideas is, I know lots more now than I do, if I should work the whole year

through I couldn't do the things I knew that should be done, all these ideas for growin' sorghum and cowpeas and testin' cows and feedin' swine are worth the price, they're mighty fine, but one man's life ain't long enough to put in practice all that stuff, and one man's farm is far too small to even start to use it all. More information I don't need, but time to test my cows and seed, feed balanced rations to each cow and do the things that I know now. We're full of facts up to the brim, now what we need's some pep and vim, and time and room so's we can go and put in practice what we know!

A million million living creatures of the sea gave their lives

to make THIS YEAR'S Crop Success For you

ALL the world was water. Then came stupendous upheavals of the ocean floor. A continent was formed, strewn with the carcasses of millions of fishes, reptiles, and shell creatures. Plant growth beyond description. This is Nature at work creating those inexplicable, limitless deposits of Chilean Nitrate of Soda.

The mighty forces of Nature all combined to make Chilean Nitrate the superior nitrogen fertilizer. It is the natural nitrate, the good old "Soda" upon which the whole South relies for paying crops of cotton, corn, fruit, truck. Due to its natural origin, it contains rare elements—iodine, boron, magnesium, etc.

Science has learned that these rare elements, once considered unimportant in plant growth, actually are of tremendous value. They are plant foods in themselves. Combining with its nitrogen, they make Chilean Nitrate a super-

At the right, William F. Meyers of Crawfordsville, Ind., Grand Corn Champion in the 1929 National Corn Show, and, at the left, Homer W. Dice, of the same town, winner of second place, are both consistent users of Chilean Nitrate.

nitrate... Nitrogen PLUS. This explains the never-failing superiority of Chilean Nitrate in official tests and in the experience records of practical farmers. It increases yield and quality so effectively that it pays back its small cost... then pays a good profit too. It is often the difference between big success and profitless crop.

See Your Fertilizer Dealer

Go to your dealer to buy Chilean Nitrate. He wants to sell you what you want... so say Chilean Nitrate. That word "Chilean" is your protection and his. It is the promise of Nitrogen PLUS, the more important thing to remember when you order your fertilizer.

New 100-lb. Bag!

New 100-lb. Bag: better condition of contents and bag; easier to handle; the bag without a backache.

Lowest Price!

Chilean now costs less than at any time in the past 25 years. Place Your Order Now.

A.A.'s Western New York Farm and Home Talk

The Water Supply Problem

By M. C. BURRITT,

HAVING experienced both, I have never been one to extol the advantages of country over city living. But I must confess that one of them is not, as a rule, an abundant water supply. We have four good sized cisterns and

M. C. Burritt

two good wells on this farm but we have been compelled to haul water both for house use and for the stock this fall and early winter. Staying in city hotels much of the time, as I am compelled to do, where there is no limit to the water available, the necessity for conserving water when I am home always impresses the deficiency of country water supply upon me.

Certain farms are, of course, fortunate in being located on streams, or in having springs, or in a few cases in being adjacent to city water supply mains. But on the great majority of farms, at least in this section of the country, providing an ample water supply is both a problem and a source of great expense. There are a few towns where the population is sufficient to provide a town water system for at least a portion of the town upon a tax basis. Yet with most of us it is an individual problem. To fruit growers requiring thousands of gallons of water for spraying the problem is even more important. We have to choose between deep driven wells and long pipe lines to the creek. Just here choice is sometimes modified, too, by deep driven wells going through strata containing salt or sulphur. Either method is expensive enough, but under modern conditions one or the other is essential for an abundant supply of water which we must have at all times.

Pruning Is Late

Small progress has been made with pruning in this vicinity to date. A few growers have a good deal done but generally I would say that less than usual has been done. While we have had a mild winter so far and some fine open weather, the ground has been quite steadily covered with snow and the weather cold or blustery at times. Many old apple trees have been cut for wood, however. The process of transferring old high trees and odd varieties to the woodpile is going on rapidly. Within a mile of this farm four of these old orchards embracing nearly 15 acres have practically disappeared in the last few years.

Another State Horticultural Society meeting has come and gone, making its usual fine contribution to the industry and especially in this area. Only those

who participate in this great meeting and exposition fully appreciate its value. It is most satisfying to everyone, including exhibitors, members and visitors to the hall. Seldom does one hear any serious criticism of any part of this meeting and show. One reason for this is no doubt the fact that the officers, especially the secretary, are always seeking and are unusually responsive to any suggestions made for improvements. This is a genuine farmers' affair of which they are justly proud and a very useful institution.

Two or three features are noteworthy in this year's meeting. The commercial apple exhibits were the best ever, with a much larger percentage passing inspection than usual. This improvement in the pack this year is most gratifying. Another outstanding feature was the emphasis on boys' exhibits and speaking contests. The Society is surely doing its part in the practical training of future fruit growers. As usual, the program included things of outstanding interest to growers, such as spraying—a very good moving picture on insect control was shown by the College—pollination results during the last session, taxation, and cooperative marketing progress.—Hilton, N. Y. January 25, 1931.

Growing Apple Trees in Sod

FOR the past few years there has been something of a trend away from cultivated orchards and toward sod orchards combined with applications of some form of readily available nitrogen. At the same time, many have felt that it was necessary to cultivate the young growing orchard in order to get best results.

Recently the Ohio Experiment Station conducted a number of experiments to determine the results of leaving young orchards in sod. On the Mahoning County Farm, young trees set out in sod which have never been plowed or cultivated, have grown to bearing age with exceptionally good results. In fact, the Station reports that they grew faster and came into bearing earlier than similar trees in a cultivated orchard.

Two years after the trees were set out an application of a readily available nitrogen carrier was made at the rate of 1/4 pound per tree. Each year the application was increased from 1/4 to 1/2 pound until 2 3/4 pounds per tree was applied seven years after the orchard was set out. This nitrogen carrier is put under the outer branches of the tree as soon as growth starts in the spring.

The Station emphasizes that the results of this experiment should not be interpreted to mean that young trees can be set out in sod and allowed to shift for themselves. It is important that nitrogen be added and that weeds should be mowed at least twice a year.

"No smoke! I'll bet four dollars the cook has left!"—LIFE.

WHAT HAVE YOU TO HAUL?

Put it up to the Ford Truck

IN THE business of farming, Ford trucks have found an important place. Daily, throughout the year, and in every locality, these trucks are helping to lighten many hauling-tasks. For short runs, with light loads, or heavy-laden on long hauls, they bring speed, power, and endurance to the work. And their economy becomes more evident with each mile they travel and every day they serve.

The simple design of the Ford 11½-ton truck, and the economies effected by Ford manufacturing methods, keep the first cost of this truck low. The special steels and other fine materials of which it is built, the use of more than twenty ball and roller bearings at important points in the chassis,

and the great precision with which its mechanical parts are made, all give strength, reliability, and long life to the Ford truck.

As a result, this truck can be kept in continued service with a minimum of repairs. It is economical both to operate and maintain, so it costs but little to own a Ford truck, and to use it for all your hauling.

The Ford truck can be equipped with the standard stake, grain-sides, or cattle-rack bodies, and with either open or closed cabs. There is a choice of high or low rear-axle gear-ratios, which will adapt the truck to your particular needs. Dual rear wheels are available at small additional cost. Go to your Ford dealer and examine these trucks the next time you are in town.

FEATURES of the Ford Truck

For every crop, for every soil ... there's a field-tested Royster formula that will grow good yields for you.

THERE IS A Royster

HE IS A GOOD

DEALER NEAR YOU—

MAN TO KNOW

Averages 396 Bushels of Potatoes an Acre for Five Years

FOR each of the last five years T. C. Perley, Grafton County, New Hampshire, has raised an average of 29 acres of potatoes yielding 296 bushels an acre, or more than twice the average of the state. A clover crop is plowed under in the spring and then harrowed until the dirt rolls up in front of the disk-harrow. The potatoes are put in with a planter in 33-inch rows and 11 inches apart and fertilizer at the rate of 1,200 pounds an acre is applied at the same time. A double strength mixture with formula of 8-16-16 is used. Cultivation is started as soon as the plants begin to make their appearance and a two-horse hoe is used to hill up the rows. Weekly spraying is the rule and sometimes a double spraying is required. It is felt that this practice saved the crop two years ago. A six row traction sprayer has been found adequate to do the work, the vines being still green at digging time every year since 1925. Mr. Perley believes that a week to 10 days of growth after September 1 adds 50 to 75 bushels an acre in yield. This year the growth of vines was so large that they had to be pulled before digging, although an attempt had been made to kill them by spraying with copper sulphate. A gasoline engine powered digger is used to harvest this annual bumper crop.

Early Nurse Crops Best

Why is it that in some seasons better results are secured with clover by using peas or wheat as a nurse crop instead of oats?

It seems that better results are due to the fact that the wheat or peas are taken off the ground a little earlier and as a result clover gets all the benefit of the moisture and plant food a week or two earlier.

Sometimes this difference is very marked and, on the average, peas or wheat are a better nurse crop than oats. Of course, where oats are used you are likely to get better success with the seeding if the oats are cut for hay instead of for grain.

Fertilizer for Cabbage

What fertilizer is commonly recommended for growing early cabbage?

THE Connecticut State College of Agriculture reports that most of the best market gardeners in Connecticut have found that liberal application of fertilizer pays. A common practice is to apply from a ton to 2,500 pounds of a 5-8-7 fertilizer broadcast and harrowed in just before setting the plant. About a week later, from 250 to 300 pounds per acre of a readily available nitrogen carrier is spread around the plants. This college reports that the use of manure with early cabbage seems to delay the heading by from 10 days to 2 weeks.

The G. L. F. Marketing Plan

(Continued from Page 3)

particularly good reputation on the receiving markets. Milk is the only New York state product that has maintained sufficiently high enough quality to top the market over milk shipped in from greater distances. The high place which New York milk holds is largely due to the efforts of the League in the early days to get the dairymen to produce better milk. This was a long educational program and the same thing must be done with many lines of produce. Varieties must be standardized. The adaptability of certain soils to crops must be further studied. Potato growers must grow fewer varieties and stop growing them on marginal land or soils infested with disease that affect the appearance of the tubers. In all of this educational work the G. L. F. would like to co-

operate with the College, Experiment Station and Extension Service. Our own store managers will have to know more about what constitutes quality in eggs, fruits and vegetables.

2. *To so grade, pack and label the produce that it will command special recognition on the receiving markets.*

This means training of a number of men to know how to grade and pack produce so that it is second to none when it reaches our market. We know we will have men who will not meet the requirements and we will have occasional loadings that are not up to the standards. I believe, however, with central control and the shifting of personnel we can eliminate a great deal of this.

3. *Eventually to secure for the farmer a greater return on his produce.*

If we cannot accomplish this we cannot justify getting into this phase of local farm service. I believe we can achieve this objective over a period of five to ten years but it must be a slow sound program.

Just how the G. L. F. will accomplish these things is not known. We do know that this service will not be set up in any community unless the local producers are willing to cooperate and demand it. It will undoubtedly mean a G. L. F. Cooperative Marketing unit set up in the community which will be so organized as to ship anything from eggs to fruit using the G. L. F. Farm Service Agency as the facility through which the packing will be done for a service fee. This same marketing unit must be the contact with the wholesale buyer or the retail market.

The G. L. F. will do everything possible to assist in the development of these units.

G. L. F. Marketing Experiences So Far

1. *Eggs*—At Ithaca we have had seven months experience which has taught us that we cannot buy and grade, pack and sell farmers eggs and return them more money unless the producer will give us his output consistently. The plan must be changed to a cooperative marketing service on a service basis.

2. *Cull Cattle*—So far our experience indicates that this service can be operated easily and to the great benefit of the dairymen, particularly under present conditions.

3. *Grain—Hay—Straw*—These commodities depend a great deal on conditions but a development of service to service exchange will handle a large quantity.

4. *Cabbage and Potatoes*—Cabbage loading has been very successful so far and with the building of further outlets of the better kind it should improve. Potato shipping has been curtailed by low prices but there is a big field in the retailing of New York State potatoes in upstate cities. We are experimenting with this phase also.

5. *Fruit*—Our experience so far at two or three points opens up great possibilities providing we can find men who will grade and pack fruit to meet the receivers requirements and not according to the growers demands.

Vegetable growers will be interested in "Vegetable Growing" by James Edward Knott of Cornell University. This book is published by Lea & Febiger of Philadelphia, Pa. and sells for \$3.25. This book takes up questions such as securing good seed, using cold frames and hot beds, transplanting, upkeep of fertility and cultivation, and following this gives a brief summary of important cultural methods for each of the important vegetable crops. Vegetable growers will find in it many useful facts in a concise form.

"The Roadside Market" is the name of a new bulletin written by Nancy K. Masterman and Helen B. Crouch and published by the New York State College of Home Economics. The bulletin presents in readable form facts which have been brought to light through a study of wayside stands as a means of adding to the farm income. The bulletin is free to residents of New York State and may be obtained by writing to the New York State College of Home Economics at Ithaca, N. Y.

Top-dressing grain tops off the harvest with extra Profits

Nitrogen means growth. Experiment stations say: "The value of top-dressing small grains with an application of readily available nitrogenous fertilizer is well understood" (South Carolina Experiment Station); "Wheat is very responsive to applications of available nitrogen" (Ohio State University Agricultural College Extension Service).

And results obtained by 30 farmers confirm these recommendations. Top-dressing with Arcadian Sulphate of Ammonia increased their average yield from 7 to 13 bushels of grain per acre—a 48% gain over fields not so treated.

Arcadian Sulphate of Ammonia is guaranteed 20.56% nitrogen—all quickly available. It is easily applied and comes packed in 100 lb. bags for convenience; 200 lb. bags for economy.

Order Arcadian Sulphate from your fertilizer dealer when you get your mixed goods.

With the A. A. Fruit Grower

Spray Machinery

THE producer who is growing any considerable amount of fruit is faced with the problem of just what to buy in the shape of spraying or dusting machinery. Even though he may have fairly adequate equipment, there is always a possibility that costs could be lowered by buying something newer and larger or that a change in materials or method of application might control insects and diseases better.

Of course, smaller machines are useless except for the home gardener. There are still on the market a number of hand spray pumps, including the atomizer type, the bucket pump, the wheel barrow sprayer and the knapsack sprayer. For the man with any considerable amount of fruit, the choice rests between a duster or sprayer of the traction or power type or the installation of a stationary spray system.

How Big An Outfit?

Before coming to any conclusion there are a number of points that should be considered. First, of course, is the question of capacity. A sprayer which will operate one spray gun will, cover about 250 trees in ten hours. A power sprayer which will carry two spray guns will cover about 500 trees in ten hours. In figuring the capacity which he will need, the grower will ordinarily consider that four spraying days a week is about the limit.

The question of water supply is also important. Some growers who do not have this handy water supply have concluded that under their conditions a duster is more satisfactory than a sprayer. A traction sprayer delivers pressure only when it is in motion and for this reason the power sprayer is to be preferred for orchard use.

A few of the larger orchardists have installed stationary spray outfits. These consist of a central power plant with a system of pipes laid out through the orchard and carrying outlet valves at intervals so that all trees may be sprayed by the use of a hose from seventy-five to one hundred feet in length. The original cost of such equipment is, of course, high, but the cost of application is low. It is stated that such a system increases the acreage which can be covered by a given crew anywhere from 25 to 60 per cent. It eliminates a waste of time in driving the spray tank to be refilled, it saves horses and tractors for other work and makes it possible to apply even though the ground may be too soft to allow the use of a portable sprayer. Time, of course, will tell just how common this type of outfit will become.

* * *

What are the advantages of spray guns over the old disc nozzle?—R. N., New York.

THE principal advantage is in the speed of application. The disc nozzle has a capacity ranging from $\frac{3}{4}$ to $2\frac{1}{2}$

gallons per minute where pressure of 250 pounds is used. At a pressure of 300 pounds the spray gun will apply from three to six gallons of spray material a minute.

One of the disadvantages of a spray gun is a tendency to expect too much of it, resulting in poor work and loss of good fruit. For good work with a spray gun it is essential to have high pressure.

Why Insects Attack Some Trees

Why is it that one tree sometimes is attacked by insects much more severely than other trees in the same orchard?

THERE are a number of possible reasons for this condition. In the first place, insects ordinarily attack the weaker tree or at least, their attacks are more noticeable on the weaker trees. Certain insects attack trees which are sheltered from cold winds while other trees may be more severely injured because they are closer to some source of infestation. One example of this in the case of grapes is that the several rows nearest the edge of the field may be severely injured by certain insects, particularly if there is a good size hedgerow along that side of the field.

Sweet Clover as a Cover Crop

Do you recommend sweet clover as a cover crop in orchards?

SOME growers have tried out sweet clover and it certainly is a very promising cover crop. Where you can get a good growth it will add nitrogen and organic matter to the soil in large quantities. Other growers have tried out alfalfa, the advantage being that alfalfa does not need to be seeded regularly. This, of course, means that you practically have a sod orchard where with sweet clover you could sow it every year and plow it under.

Controlling Brown Rot and Plum Curculio

We have two Lombard plum trees in the garden and they are troubled some with curculio and brown rot. What can we do to control these troubles?—C. A., New York

IT is considered more difficult to control curculio in the back yard than it is in a commercial orchard. Lombard plums are susceptible to brown rot and curculio is one agent which spreads this disease. Brown rot can be controlled, however, by using lime sulphur, lime sulphur dry mix or sulphur dust.

If your strawberry bed or small fruit patch is getting "seedy", this is a good time to plan renewals.

Our gardener can think twice as well with a rake as he can by hand.

**VEGETABLE
GROWER**

Celery Blight

CELERY blight can be controlled fairly easily by applying home-made Bordeaux mixture. The application should start in the seed bed before the plants are put out on the field, and in order to get best results spraying should be repeated every seven to ten days, depending on weather conditions. When weather is fair, once every ten days is probably sufficient, but where it is cloudy or rainy, it is best to spray once every week.

Where a sprayer is not available, good control can be secured by using a copper-lime dust containing a mixture of from 20 to 25 lbs. of finely ground copper sulphate and 75 to 80 lbs. of thoroughly hydrated lime. The best results will be secured by applying this along towards evening, so that the dew will have a chance to dissolve the copper on the leaves.

Burning Cucumber Beetles

ONE of the most frequent questions asked about vegetables is concerning the control of cucumber beetles. Probably the best method of control is to screen the plants until they get a good start. Where this does not seem advisable, the cucumber beetles can be controlled fairly well by spraying with a mixture of three pounds of calcium arsenate, three pounds of a commercial spreader and fifty gallons of water.

Some success has been reported by planting a few squash seeds in with the cucumbers. These plants were not sprayed and the beetles congregated on them in large numbers where they were killed by the use of a blow torch.

Dilutions for Home Gardener

WHEN a dilution label reads "1 to 1000" an easy way to get it accurately is to use a quarter teaspoonful to a quart of water. If a four percent solution is wanted, two and a half tablespoons are needed to one quart of water.

A quart contains 256 level teaspoonfuls or 64 tablespoons. A cup holds 16 tablespoonfuls.

Miss Griswold at the N. Y. State College has worked out these tables in full. You may get one free by asking for bulletin T-1, a method for mixing insecticides in small quantities. Send to the Mailing Room, Roberts Hall, Ithaca, New York.

Some Points to Consider When You Buy Seed

(Continued from Page 2)

Where oats smut is at all troublesome, treatment with formaldehyde, which costs little either in money or time, will prevent loss and lessen the dust at threshing time.

Briefly, the problem can be summarized as follows: Buy of a reliable dealer. Choose a variety that has been successful on your farm or on other farms in your neighborhood. If you experiment with a new variety, try it out on a small scale. Read the tag on the seed bag. (A copy of the "New York State Seed Law" may be secured by writing to the Geneva Experiment Station, Geneva, N. Y., or a copy of the "New Jersey Seed Law" by writing to the New Jersey State College of Agriculture, New Brunswick, N. J.) Use a fanning mill if you are using home grown seed and treat your seed wherever it seems that disease can be controlled in this manner.

"Low cutting of corn is one of the most economical and effective methods of controlling the European corn borer."

These Plows Give Crops a Better Chance

McCormick-Deering 4-bottom tractor plow pulled by McCormick-Deering 15-30 Tractor

THE whole scheme of crop production hinges on good plowing—and when you buy a plow let the reputation of the manufacturer be your guide. McCormick-Deering Plows have three generations of plow-building experience behind them. They are as good as money can buy. They are built for the work, balanced just right, are light draft, and easy running.

The McCormick-Deering dealer can give you just the plow you need for

your soil. There is a wide variety of McCormick-Deering Plows for all purposes and for all soils. The full line includes tractor and horse plows in the moldboard and disk types, from one bottom to four bottoms in moldboard plows, and two to six bottoms in disk plows. For the sake of your crop production it pays to have the best plows you can get.

See the McCormick-Deering dealer now. Write to us for literature on how to get the best results from plows.

There is a complete line of horse plows

"They're making
more money
with less feed"

*A good Balanced Ration
saves feed; increases profits*

DAIRY RATION	
With Clover Hay	
Ground Corn, Hominy or Barley	200 lbs.
Ground Oats	200 lbs.
Wheat Bran	100 lbs.
Linseed Meal	100 lbs.

Right now is the ideal time to adopt modern feeding methods. Your short feed supply will last longer. And it will put more milk in the pail while it lasts.

Use protein-rich Linseed Meal to balance home-grown grains. Keep records. Feed according to production. Get rid of the losers.

That's the way successful dairy-men are making money. The same plan will work on your farm.

The ration given above is an example of the right kind of mixture. (See Linseed Meal Chart of Balanced Rations for other mixtures.) If you use ready-mixed feeds, replace the wheat bran and Linseed Meal in the above ration with 250 lbs. of good 24% feed. Be sure it contains Linseed Meal—look

on the label. Your dealer can supply you with "pea size" Linseed Meal if it better suits your needs.

Linseed Meal is the old reliable protein supplement. Farmers have used it for years. It keeps your cows in condition for heavy milk production. Enables your cows to produce more milk per pound of feed.

How to Feed Right

The Linseed Meal Book "Feeding for Profit" gives you the latest facts on modern feeding methods. And the Linseed Meal Chart of Balanced Rations gives you the proper mixtures for all farm animals.

Both the Feeding Book and Ration Chart will be sent to you free if you mail the coupon.

Raising Calves on Dry Grain

FOR the past year or two there has been quite an interest in developing rations to be fed dry to calves as a substitute for the old calf meals which were mixed with water and fed as a gruel. At Cornell, calves have been raised on a total of 325 pounds of whole milk fed during the first seven weeks of the calf's life. After that time the calves received only dry grain, hay, and water.

This dry grain mixture is known as a "Calf Starter" and is composed of the following ingredients: 16 per cent ground yellow corn, 16 per cent rolled oats, 16 per cent wheat bran, 8 per cent linseed meal, 44 per cent dry skim milk. This mixture was limited to 5 pounds daily per calf, and was fed only until the calves were 16 weeks of age. After the "Calf Starter" had been discontinued the calves received 4 pounds a day of a "Heifer Mixture" which was composed of: 30 per cent ground corn, 30 per cent ground oats, 30 per cent wheat bran and 10 per cent linseed meal.

At Cornell, fifteen calves fed this way gained an average of 1.7 pounds per day during the first six months of their lives, which is considered very satisfactory growth.

More Protein from Clover Hay Than Timothy

A COW has to have about 710 pounds of digestible protein to produce 7,000 pounds of 4 per cent milk. To do this she needs, in a year, 2 tons of hay, 5½ tons silage, and 1 ton of grain. If the hay is timothy it will contain about 150 pounds of protein or if it is clover or alfalfa it will furnish near 300 pounds.

Based on the value of 10c a pound on protein, this means that the clover or alfalfa hay is worth at least \$7.50 a ton more than timothy.

What About Your Separator?

Does it make any difference what kind of a separator we buy? We have six cows and are not able to ship fluid milk.

WE are glad that this question is raised, because there are still a lot of American Agriculturist subscribers who separate their milk, and it makes much difference what kind of a separator they have.

A poor separator, or a too cheap one, is a very costly machine. More than \$2000. worth of butter fat has been left in the skim milk by faulty separators or by careless operation during the first four months of the year among members of herd improvement associations in one section. Some associations have reported an average loss of \$21.00 per member. Profit and loss are too close a matter in the production of milk and butter fat to take such chances. Be sure that your separator is doing a good job, or get one that is.

In addition to worn-out separators, losses may be due to flushing with cold water instead of lukewarm water and to lack of proper care of the separator. It has been found that losses of fat may be three times greater in separators which have not been washed after each using.

Iodine in Milk

Why do we hear so much about iodine in milk and other foods at the present time? What is its value. Can the iodine content in milk be increased by feeding?

IT has been found that iodine is a preventative or control of the disease known as goiter. It has also been shown that people living inland remote from sea water are more likely to have this disease than those who live on the seacoast. Experiments have been conducted in

GET THIS NEW BOOKLET Before You Build or Remodel Any Farm Building

CONTAINS important information that will actually save you money and give you a better job when you build, remodel, ventilate or equip any dairy barn, hog house, poultry house or other farm buildings. Avoid costly building mistakes, get greater convenience, save time and expense in doing the barn work, by PLANNING before you build. This booklet will show you how.

THERE ARE ONLY 2 NATURAL MILKERS

Universal natural milker

The calf is the world's only perfect milker. The calf milks according to the laws of nature . . . low vacuum suction and a gentle upward massaging of the cow's teat.

And next to the calf comes the Universal Natural Milker. It sucks with low vacuum and gently massages upward . . . just like the calf. It milks with half the labor, in less than one-third the time required by hand, producing milk of the lowest possible bacteria count . . . which always brings top prices.

And HE JUMPED OVER THE Moon!

MORE than twenty-five years ago a dairyman fed his cows Dried Beet Pulp for the first time and was amazed at the results. Immediately milk flow increased—soon his cows were in perfect condition, bright-eyed, sleek-coated—and his profits jumped to a new high level.

Today dairymen get the same fine results. And with the present extremely low price it brings a new opportunity for increased dairy profits. IF HAY IS HIGH PRICED, REPLACE IT WITH DRIED MOLASSES BEET PULP. SIX POUNDS OF BEET PULP WILL DO THE WORK OF TEN POUNDS OF HAY AND DO IT BETTER! Feed it in place of corn, silage and other carbohydrates. It's bulky, cooling, palatable and laxative—it fits any ration and is good for all animals.

If your feed dealer doesn't have Dried Molasses Beet Pulp he will get it for you. Shipments made direct from factory nearest to buyer.

NEWTON'S Compound
Heaves, Coughs, Conditions, Worms, Most for cost. Two cans satisfactory for Heaves or money back \$1.25 per can. Dealers or by mail. The Newton Remedy Co. Box M. Toledo, Ohio

an attempt to increase the iodine content in milk by feeding seaweeds, or other forms of iodine, and this simply becomes an attempt to determine whether or not the body has a regulating mechanism for iodine. Indications are that the feeding of iodine can increase to some extent the amount found in the milk. However, this amount is very small. A large bulk of feed has to be wasted to get a small amount of iodine in the milk. It is therefore doubtful if iodine in milk is more effective than iodine fed direct.

Sale of Unpasteurized Milk Not Prohibited

DURING the week just past, we have received letters from many sections of New York State, asking whether there was any immediate prospect of a New York State law requiring that all milk sold at retail be pasteurized. The rather widespread rumor that such action might be taken has naturally been received with considerable concern by dairymen. For example, the Wyoming County Pomona Grange on December 17, adopted a resolution protesting against any statewide ordinance prohibiting the sale of raw milk.

In order to get absolutely authentic information on this, Henry Morgenthau, Jr., publisher of American Agriculturist personally called on Dr. Thomas Parran, Jr., State Commissioner of Health, and asked for a statement from him. The following statement from the State Health Department is authorized by Dr. Parran:

"That the Department has been advocating statewide compulsory pasteurization is a baseless rumor which has been 'going the rounds' for at least two years. The Department advocates pasteurization as the most effective measure for preventing the spread of communicable disease through milk. That there is need for the application of such a measure is indicated by the fact that since January 1, 1917 there have been 85 milk-borne outbreaks of sickness in the State, exclusive of New York City, 93 of which have been traced to unpasteurized milk. The Department, however, recognizes that under present conditions there are many sparsely settled sections in which a requirement that all milk be pasteurized would be impracticable of enforcement. A bill introduced in the Legislature two or three years ago which would have made pasteurization compulsory throughout the State did not have the Department's support."

What is "Guild of Gopatis"

THE Guild of Gopatis is an honorary association of all dairymen in the United States who belong to dairy improvement associations and whose herds averaged 300 pounds of butterfat or better in a year. Last year, 308 New York State dairymen won this distinction while this year at Farmers' Week, fifty-six additional New York dairymen will be initiated into the Guild. Heading the list is A. J. Williams of West Winfield, whose herd averaged 542 pounds of fat. Second is Albert Button of Steuben County, who is the only other New York State dairyman to have a herd average of better than 500 pounds. Twenty-seven New York State herds averaged better than 400 pounds.

A new 48-page booklet which will be found of much practical value to feeders and which carries the title of "More Profits from Home Grown Feeds" has just been published by the Papec Machine Company.

The booklet covers the general care and feeding of dairy cattle, beef cattle, horses, hogs, sheep and poultry and includes feeding formulas for each of these groups of live stock.

The advantages of ground feed and chopped hay are pointed out and the added nutritive value given to grain and roughages by such grinding and chopping are explained. The booklet also has useful silo filling and digestible nutrient tables. Any reader may have a copy of this new booklet by writing to the Papec Machine Company, Shortsville, N. Y.

Soaking, steaming, or cooking livestock feeds may slightly increase the digestibility, but usually not enough to pay for the expense and work involved.

Cut Costs the De Laval Way

AN AVERAGE size outfit consisting of a two-unit De Laval Magnetic Milker with Alpha Dairy Power Plant will cost only five cents per milking, based on a life of ten years with twice-a-day milking. (There are many De Laval Milkers which have been in use more than ten years, still doing good work.)

Add four cents for gasoline, oil and upkeep, or electricity, and you have a total cost of using a De Laval Milker of nine cents per milking.

According to an investigation among more than 1800 users, the De Laval Milker saves an average of one hour per milking (over hand milking). If these users were still milking by hand they would be paid only nine cents for that extra hour. In many cases the entire time of one or more men was saved.

No one can afford to milk cows by hand when you can get a De Laval Milker at such a small cost. Here is a sure way of cutting your cost of producing milk. A De Laval can be purchased on such liberal terms that you can use it while it pays for itself.

In addition you get better milking and cleaner milk. The De Laval Magnetic is the world's best milker. It milks better, faster and cleaner than any other method.

In addition the generator on the De Laval Magnetic Milker makes enough surplus current for lighting four electric lights, which light the average barn in a splendid manner. Users are delighted with this wonderful free light.

In addition the Alpha Dairy Power Plant is so designed that the heat from its cylinder is utilized to heat water. When you get through milking there is a supply of hot water right when and where you need it most for cleaning the milker and other utensils. This hot water doesn't cost you a cent, and enables you in just a few minutes to keep your milker in the cleanest condition.

In addition, run your De Laval Separator from the Alpha Dairy Power Plant. As soon as you have milked a few cows, start separating, and when you are through milking your separating is finished too. In this way you can save at least an additional half-hour.

No matter what your milking or separating requirements may be there is a De Laval Milker or Separator which will do your work better and at less cost than any other. See your De Laval dealer or write nearest office below.

Higher Taxes for Commercial Vehicles ?

(Continued from Page 5)

tion is destroyed.—If more funds were available for reconstruction hundreds of miles of these old roads could be rebuilt for hardly more than half the amount it will cost after their foundation is gone.

"The estimated revenue from that tax (motor fuel) and the license tax for the year 1930 is \$69,000,000 of which the State's share (75%) is nearly \$52,000,000.—It is hoped that the State will not fail to appropriate for the construction and reconstruction of State and County highways and bridges thereon at least all of the State's share of the funds derived from taxes imposed on the motorists. The system needs much more money than these taxes will furnish—".

Commissioner Brandt also calls attention to the more than 40,000 miles of the town road system on the maintenance of which millions of dollars of town funds and State aid money are spent every year without any permanent improvement. He suggests a ten year building program which would improve 25,000 miles of those town roads at an estimated cost of \$175,000,000. I have quoted thus at length from the annual report of the Superintendent of Public Works to show the State's need for increased revenue from motor vehicles for road building purposes. I am sure everyone will agree that so far as possible this revenue should be obtained from the users of the roads in proportion to the damage they do to them.

Now if you will refer to the following table I think you will agree that the 1930 taxes paid by commercial motor vehicles in New York are ridiculously low. Instead of being only 1/5 or 1/6 as high as the average fees in the United States, I believe there are further reasons why commercial motor vehicles should pay higher taxes in New York than most other states.

Average Taxes on 3 Ton Trucks As of January 1, 1930*

Public Utility regulatory bodies recognize the justice of higher telephone rates in centers of dense population because each subscriber can call more numbers without added tolls than is possible in small towns or rural com-

munities. By the same process of reasoning New York's greater mileage of improved highways would justify the highest motor taxes instead of the third lowest.

With the A. A. RADIO MAN

ABC Radio Guide

THOSE of our readers interested in keeping in step with the latest developments in radio and radio equipment will find much helpful information in the new radio text book "A B C Radio Guide" by Hathaway and published at \$1.50 by the American Technical Society, Chicago, Ill.

This book of nearly 150 pages and 65 illustrations is devoted exclusively to the new all electric radio sets, screen grid tubes, and electro-dynamic speakers. It is written in a clear and non-technical style and is intended for high schools, trade schools, radio repair men, and for radio fans who like to know how the different parts of a set work and to have some idea of how to locate trouble when it develops.

Radio Questions

How can I learn the code, so as to understand code messages sent by ships and amateur stations. I have a short wave set and would like to know what the amateur stations are sending.

THE American Radio Relay League has information on this subject. Write them at Hartford, Conn. and explain as above. You can buy a mechanical code teacher, phonograph records, or build a simple set for long wave reception, where you can practice on slow signals. A good way is to join an amateur radio club, as they usually have code classes.

* * *

What will be the cheapest way of changing my set to run from an electric light socket? Will I need to use different tubes?

The most economical way would be to use an "A" eliminator. However, as you are using a storage battery at present, why not get a trickle charger with automatic switch. The set will then be practically trouble-free, and the battery will be maintained in a charged condition all the time. If you wish to do away with the battery, an "A" eliminator will be the next most economical change to make. The same type of tubes are used.

* * *

Why isn't it necessary to disconnect the "B" battery of my set at the same time that I shut off the "A" battery? My "B" batteries do not last long.

As soon as the filaments of your tubes become cold, no current can be drawn from the "B" batteries. Perhaps you are not using a large enough size of "B" battery to get economical results.

A Workshop Saves Time

By JACK BAKER

TOM ANDERSON, because of his well-equipped workshop, with tools, forge, and vise and drill press, never has to take time off to repair his machinery when he is needed in the field for he makes repairs on his broken machinery on rainy days. He is very handy with tools, too, and is always "tinkering" on some machinery in need of repair or making some handy tool to better equip his workshop.

His workshop is not large or elaborate, nor does it represent any great outlay of money, but is one of the very commonest and handiest arrangements.

Tom Anderson at work in his shop. Note that the post drill is run by an electric motor.

One end of his shop is partitioned off, leaving a wide door on both sides of his shop and a driveway through the center. Several double sash windows provide sufficient working light. In one end of his shop he keeps all machinery that is in need of repair and in the other end a small concrete floor serves as a secure base where mechanical power is used for running the drill press, grindstone and lathe. The concrete floor, he says, is easier to keep clean and also lessens danger from fire, as his shop contains a forge.

Anderson has made many handy tools, mostly in spare time and on rainy days, some of these tools include many blacksmithing tools that can be made by any handy workman, and a small anvil he made from a piece of railroad iron. Old files, broken automobile springs, and pieces of scrap steel or iron were made into pincers, hooks and punches. All assorted wrenches, drills, screw-drivers, bolts, etc., are kept in drawers and on visible racks within handy reach.

No Home Test for Oil or Gasoline

A READER asks for a practical method of testing gasoline and kerosene so as to be sure he is getting good quality. I do not know of any way in which the average farmer can make such tests and get any results at all. Such tests require rather expensive instruments and very careful weighing and other operations. The average farmer would be completely lost if he undertook such work.

Nor do I believe that it will pay the average farmer to go to the trouble and expense of making these tests or having them made for him. The gasoline and kerosene now days is more uniform than it used to be, in spite of your opinion to the contrary, as refining companies are coming more and more to blend their raw crude oil with the idea of making a more uniform grade of fuel and lubricating oil, especially lubricating oil and—by trying several brands until you find one which works satisfactorily in your tractor and gasoline or kerosene engine, I believe if you will then stick to this

brand, you will get more uniform fuel than if you try to buy from everybody and test the fuel as it is bought.—I. W. D.

Watch Your Battery Terminals

CARE should be taken that the battery terminals do not become corroded with acid, which not only interferes with the proper current from battery into cable, but also destroys the cables. Have the cables removed and the terminals and cable ends thoroughly cleaned, and then after they are put back, smear them heavily with cup grease or vaseline. Ordinary stiff trowel roofing cement pressed under and over the terminals and cable ends is also an excellent material not only in keeping them clean but in preventing the battery acid from working out. A graphite grease is also an excellent material.—I. W. D.

About Types of Pumps

"I wish to pump water from a driven well 14 to 18 feet from the surface to the water and elevate it to height of 20 feet to tank. I would like to know which would be most efficient, a centrifugal or a rotary pump?"—W. M., L. I.

FROM your description an ordinary plunger type of pump would seem to be the type you should use. The centrifugal pump is very satisfactory where large amounts of water are to be raised short distances, as for lifting water out of a stream for irrigation purposes. Such a pump does not have very strong suction and preferably should be put under the surface of the water, otherwise is likely to require priming frequently. This would probably not be possible with your driven well. The rotary pump has a more positive suction than the centrifugal and can be used to lift water up to about the height you would have, but it also would require priming frequently. Still if properly installed it would probably work all right under your conditions, although it would not have enough lift if the water level got much below the 18-foot mark.

Under the usual conditions where you do not need a heavy supply of water, a plunger type pump with the cylinder put down under the water would be most satisfactory.—I. W. D.

Paint Will Not Stop Walls From Frosting

A READER asks how to paint the inside of his barn walls to prevent frosting in cold weather. It would be only a waste of time and money to do this because the only way you can prevent frost on the inside of your stable walls is to insulate the wall and then provide at least partial ventilation. Thorough insulation is the important thing.

If your barn is of the frame construction type, probably as cheap and satisfactory a method of insulation as you can get is to put heavy water proof paper and matched lumber on the inside of the studding and then fill in between with dry sawdust, mill shavings or some similar material. Occasionally there will be a little trouble with this filling becoming moist and it might be advisable to fix the lower board on the inside so that it can be removed and the mill shavings taken out and dried; but ordinarily this will not be necessary. If you can use commercial sheet insulation it will be even better insulation and in such cases the filling may not be necessary.—I. W. D.

OUT YOU GO, MR. WATER-THIN, YOU CAN'T RIDE ANY TRACTOR THAT QUAKER STATE LUBRICATES

MR. WATER-THIN never helped turn a furrow in his life. He's the laziest loafer that ever wasted good money. For Mr. Water-thin is the quart of useless, thin oil that ordinary refining leaves in every gallon of motor oil—a quart so useless as a motor lubricant that Quaker State engineers have dubbed it "water-thin"!

Ordinary refining *can't* remove "water-thin." But Quaker State refining gets it out—all of it. Gets it out by a special process that is one of the great achievements of modern refining. And right there you have the reason for the *extra quart* in every gallon of Quaker State. For when "water-thin" is removed it is replaced with rich, full-bodied lubricant. You get four full quarts of lubricant to the gallon instead of three quarts and a quart of waste. So you really get an *extra quart*. You get *far better lubrication* for tractors, trucks and passenger cars.

The process that removes "water-thin" is an exclusive development of

Quaker State engineers. It is found only in the four modern Quaker State refineries. It required years of refining experience and skill to work it out. It required an enormous investment in refining equipment to put it into operation. But because of it Quaker State motor oil is so good that it has become the world's largest selling Pennsylvania oil.

And remember this. Quaker State is made entirely from 100% pure Pennsylvania Grade Crude Oil,—a motor oil so free from impurities that it doesn't require acid treatment in refining. That's important! For acids tend to destroy some of the oil's oiliness.

Standardize on Quaker State. Quaker State makes great oils that are specialized for every make and type of tractor, truck and passenger car. Start now! It won't take you long to discover that Quaker State lowers maintenance costs, and fights heat and friction like no other oil made. For there's a full extra quart of lubrication in every gallon!

THERE'S AN EXTRA QUART OF LUBRICATION IN EVERY GALLON

Reviewing the Latest Eastern Markets

Milk Prices February Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream	1.66	1.50
2A Fluid Cream		
2B Cond. Milk		
Soft Cheese	1.91	
3 Evan. Cond. Milk Powder		
Hard Cheese	1.55	1.50
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class I League price for February 1929 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Holds Steady

CREAMERY SALTED	Jan. 30, 1931	Jan. 23, 1931	Jan. 31, 1930
Higher than extra	29 1/2-30	29 1/2-30	36 1/2-37
Extra (92 ac.)	29 -	29 -	36 -
84-91 score	25 -28 1/2	25 1/2-28 3/4	29 1/2-35 3/4
Lower Grades	24 -24 1/2	24 -25	27 -29

The butter market has held quite steady since our last report. Demand on the whole has been fairly good and fresh butter has cleared quite satisfactorily. At the present level it appears that the market is carrying just about all that it can possibly bear. On Monday, January 26, the market opened firm with prices well supported, under a good call for supplies. In spite of the free arrivals stock was well cleared and a confident tone prevailed. Late in the afternoon trading slowed up and on Tuesday the early market was just a little bit less firm. By the time Wednesday's market opened the tone of the market lost some of its firmness and with less buying support in evidence, the market was doing good to be considered steady. The spotty condition continued on Thursday afternoon but on Friday morning there seemed to be a little more firmness to the market. There was plenty of fine butter for everybody, and the demand appeared sufficient to keep stocks pretty well cleared.

The future market is causing some apprehension. The Chicago future market has declined and the outlook is regarded with more or less uncertainty by a great many operators, who look upon the statistical situation as unfavorable. The wide spread that formerly existed between current storage figures and those of a year ago has diminished from over five million to about three and one-half million. Furthermore, the weekly out-of-storage movement is just a shade better than half of what it was for the corresponding period a year ago.

Cheese Market Steady

STATE FLATS	Jan. 30, 1931	Jan. 23, 1931	Jan. 31, 1930
Fresh Fancy	18 -19	18-19	17 1/2-18
Fresh Average			
Held Fancy	22 1/2-22 1/2		24 -26
Held Average			23 -

The cheese market, particularly on cured cheese, has been fairly satisfactory during the past week. There has been more interest shown in eured cheese and some extra choice marks have been realizing a slight premium above top quotations. Most of the business is in small lots.

The fresh State flats show no change whatsoever. They are still draggy, meeting very little demand.

Statistically the cheese market continues unchanged. The holdings in the ten cities run about 2,300,000 pounds under what they were a year ago, with the out-of-storage movement still keeping a shade heavier than a year ago.

Pewees			
NEARBY BROWNS			
Hennery			
Gathered	21 -23 1/2	22 -25	40-41

During the week ending January 31 the egg market suffered another break that carried prices down as low as 23 1/2c to 25 1/2c for closely selected extras and average extras as low as 22 1/2c to 23c. Little did most of us expect that we would ever again see the time when the fanciest eggs

could be bought for 25c per dozen. Many of the high cost Jerseys have been placed in temporary storage hoping for a price recovery that will net more money. It may be that the unusual weather conditions that closely approximated spring-time had something to do with the situation. It may have had some effect, but we cannot blame the weather for everything. Toward the end of the week, the market began to show some recovery. Retail prices are gradually coming down and it is said that the consumption of eggs is showing an increase. As the market comes to a close gains approximate one-half cent over the low level.

On January 23, the ten cities making daily reports had approximately 473,000 cases on hand in excess of the holdings a year ago. The Price Current reports that from January 16 A. M. to January 23 A. M. cold storage holdings in the ten cities, were reduced 129,000 cases whereas during the same period a year ago holdings were reduced 82,000 cases. If that margin of increase can be maintained for the next two months it is going to help the market and the situation in general in a very marked degree. It is up to the retail trade to play its part.

Live Fowls Lower; Chickens Higher

	Jan. 30, 1931	Jan. 24, 1930	Jan. 31, 1930
FOWLS			
Colored	-21	22-23	30-32
Leghorn	18-20	18-22	25-28
CHICKENS			
Colored	22-27	21-26	27-28
Leghorn	20-21	19-20	24-25
BROILERS			
Colored	30-38	37-40	25-37
Leghorn	32-35	35-37	30-31
OLD ROOSTERS	-15	-12	-20
CAPONS	33-37	32-35	35-40
TURKEYS	30-40	35-40	32-40
DUCKS, Nearby	25-28	24-28	18-26
GESE	18-20	18-20	23-25

Live fowls are lower than they were last week, but as the market comes to a close it looks as though the price is going to recover all lost ground. Heavy colored fowls suffered the worse. As the market winds up Leghorn fowls are favoring the men who are selling, and buyers are beginning to pay the asking price. Chickens are higher than they were a week ago. Staggy stuff, of course, is not wanted, but where anything can show quality they are snapped up in a jiffy. Pullets have been in demand at all times. Rock pullets bring from 26c to 30c; Reds 23c to 26c and Leghorns 21c to 23c. Pullets that show no inclination to lay can be turned off at better prices than fowls. Broilers are holding up very well, although they are just a shade under what they were a week ago. Limited fresh receipts may shove the price a little higher. Hen turkeys still bring 35c to 40c with old toms at 30c.

Live fowls are lower than they were last week, but as the market comes to a close it looks as though the price is going to recover all lost ground. Heavy colored fowls suffered the worse. As the market winds up Leghorn fowls are favoring the men who are selling, and buyers are beginning to pay the asking price. Chickens are higher than they were a week ago. Hen turkeys still bring 35c to 40c with old toms at 30c.

Meats and Livestock

CATTLE—Steers steady. Load Good \$9.50, few mediums \$8.50. Cows slow, steady to weak; common to medium \$4.00-5.25; low cutter and cutters \$2.00-3.50.

VEALERS—Slow, steady to weak. Good to choice \$10.50-13.75; mediums \$8.00-10.00; cull and common \$5.00-7.50.

HOGS—Weak; 160-220 lbs. \$8.50-8.75.

LAMBS—Load New York fed western lambs around 25c or more higher at \$10.25.

COUNTRY DRESSED CALVES—Receipts light to moderate during the week. Demand slow all through. Market closed steady and one cent up on tops but not cleaning up. Fresh receipts per pound: Choice, 15-16c, fair to good, 12-14c; small to medium 9-12c.

HOTHOUSE LAMBS—Receipts light to moderate all the week. Demand slow all through and for fancy only, undergrades hard sellers. Market closed steady. Good to fancy each, \$7.00-11.00; imitations, each \$3.00-6.00.

RABBITS—Receipts light, moderate during the week. Demand slow and carry-overs daily. Market closed weak at 12-18c per lb.

Fruits and Vegetables

It is expected that the cold weather that characterized the last two days of January would help the apple market. Basket stock of Baldwins, Greenings, Northern Spy still bring from 75c to \$1.75 per basket, some real poor stuff even lower. Prices on barreled apples generally range from \$2 to \$5 per barrel with the exception of McIntosh, Northern Spy and York Imperial which sell from \$6 to \$6.50. McIntosh in baskets are selling up to \$2.

The onion market continues dull and weak. Western New York yellows have got to be good to bring \$1 per hundred. Orange County yellows are in the same class while reds from Orange County generally bring from \$1 to \$1.15 per hundred. Orange County regular whites bring from 50c to 65c per 50 pound bag while boiler whites bring 75c to \$1 per 50 pound bag.

The potato market is showing a little easiness. Maines generally bring \$2.75 to \$3 per 150 pound sack. Long Islands in the same sized package bring 75c more. Bulk goods per 180 pounds from Maine generally bring from \$3.35 to \$3.50 while Long Islands bring \$3.65 to \$4.

State cabbage in bulk is very slow and weak. Prices range from \$18 to \$20 per ton.

State carrots are slow and easy, ranging from 50c to 75c per ton depending on condition.

43% C. S. Meal	34.00	34.00	43.00
34% O. P. Linseed Meal	34.50	35.50	52.50

The above quotations taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Hay Closes Firmer

The hay market during the early part of the last week in January was irregular. Moderate receipts in Manhattan and liberal receipts in Brooklyn caused an easy tone. By the middle of the week incoming supplies began to slow up and this continued to the end. At the same time demand improved and the market wound up steady. Timothy grading No. 1 in large bales is scarce, prices ranging from \$23 to \$28 depending on grade. Timothy carrying light mixtures of clover or grass ranges from \$20 to \$26. Sample hay is \$19 to \$20. Oat and wheat straw is bringing \$12 per ton with rye at \$14. The straw market is slow.

More Cows Than Last Year

THE United States live stock report released January 26 shows an increase in dairy cattle in New York state on January 1 as compared with January 1st last year. The numbers were 1,424,000 as compared with 1,383,000 a year ago, an increase of 3 per cent. The pendulum has already begun to swing the other way as shown by the figures on heifers one to three years old. On January 1st New York state had 245,000 as compared to 253,000 a year ago. The entire United States shows an acreage of 2.4 per cent in the number of cows compared with last year's figures and also a slight increase in the number of heifers between one and two years old. The average value of these animals in New York state a year ago was estimated at \$120.00. This year on January 1st the value per head was estimated at \$86.00. If we accept these figures it means a shrinkage in value of dairy cows in New York state of almost forty-three and a half million dollars.

Any of our readers who are contemplating house building should find a new U. S. bulletin valuable. This bulletin is entitled, "Light Frame House Construction," and was prepared by the Federal Board for Vocational Education and the National Committee on Wood Utilization of the Department of Commerce.

This may be obtained at small cost from the Superintendent of Documents, Government Printing Office, Washington, D. C.

Farm News from New York

Farm Organizations Hold Big Albany Meeting---County Notes

ALBANY had a full week—that of the 20th of January. The old State Agricultural Society started it off with a full day's program. C. H. Baldwin as president, and Hon. Henry Morgenthau, Jr. presiding, started the meeting. Hon. Peter G. Ten Eyck spoke enthusiastically of the Port of Albany and the benefits it will be to farmers and consumers. Now, we need a big grain elevator in Albany, he said. C. R. White, president of the State Farm Bureau Federation, explained something of the State Tax situation. He did not recommend specific tax changes, but it is a fair guess that he would favor a sensible income tax and other changes that would place the costs where they can be most readily carried. Farms are too heavily taxed.

H. E. Babcock advocates less cost in marketing and fewer agencies for it. Too much machinery adds to the costs. Dr. G. F. Warren emphasized this point also and stated that the present system of city markets was set up under very different conditions from the present. It would be well, he thinks, for the state to try out in one place an improved market and see how well it works out before starting others.

Milk Buyers Bonded

Senator Leigh Kirkland presided at the afternoon session. Commissioner Pyrke gave a brief review of some agricultural legislation. The law requiring milk buyers to give bonds for payments has now stood the test of the courts, something that would have been impossible a dozen years ago. As the Dairymen's League is not considered a producer those dealers who buy from it cannot be required to give bonds.

Plans for closer relation of the various agricultural societies were considered. Committees are working on plans for the centennial of this old association in 1932. There are also plans for enlarging the museum building at the state fair grounds.

Governor Roosevelt spoke at the banquet. His talk was reported in last week's A.A.

Breeders and Dairymen Meet

The State Breeders and the Dairymen held their annual meetings following the State Agricultural Society. These were the best attended that have been known for some time. President Halliday had the assistance of Dr. Breed and others of Geneva. A discussion of milk sugar and its value had scholarly attention from Professor Sherman of Cornell. There are possibilities for further increase of the supply and its value is not yet fully realized by the public. Its ease of assimilation and its ability to correct some digestive troubles render it useful.

Cheese making in New York is not a lost art if we give credit to remarks of H. B. Sweetland of Cuba, New York, an old cheese maker, but now interested in distribution. The American people do not use enough of it and need an educational program.

Distributors Have Problems, Too

Milk distributors have their problems and E. D. Lichtenberg, executive secretary of the State Distributors Association listed some of them. The public does not realize the vast amount of capital required nor the losses sustained. Among these is the loss of bottles. There are laws to protect but not always observed and penalties are not always enforced or enforceable.

Much interest centered on regulations for a better and more uniform milk and cream supply over the state. New York city is regarded as having the best milk and the capital district as not in an enviable position. At the same time the state health authorities do not at present advocate compulsory pasteurization as a state issue. They freely say that they desire it and almost intimate that it is likely to come in time.

Oleo Holds the Front Page

The regulation of the manufacture and sale of oleo is ever present and none the less so at the present time. It has been only recently that palm oil could be used in the manufacture of this substance but chemists have now made it possible. It colors oleo yellow and a ruling has been

obtained by the manufactures that such oleo need not pay the ten cent tax. Several methods of meeting the situation are being discussed and no doubt in time something will be worked out that will prevent considerable fraud from being practiced. At the same time, delays that are likely will do the dairy industry great injury and the consuming public much harm.

Western and Canadian cream came under discussion. The cream situation is not solved but we may look for some increased demands for a higher grade of cream it would seem from comments made. These matters come slowly, however.

The Guernsey breeders held their annual meeting following the dairymen and among other things discussed the sale of Guernsey milk on its color and butter fat basis. Four and a half per cent of fat or more is suggested by the Association and a rich color indicative of the breed is to be insisted upon. High test Guernsey milk, they say, is much superior to any built up milk having the same fat content.—H. H. LYON.

December Dairy Improvement Records

DURING the month of December New York State Dairymen who belong to sixty-two dairymen's associations secured records on 29,431 dairy cows. At first thought it would seem that a considerable proportion of dairy cows in New York State belong to these associations, but when we find that the January 1st Federal live stock report credits New York state with 1,424,000 cows it will be seen that records are being kept only on a comparatively small number.

The high individual for butterfat for the month is owned by G. S. Cowles & Son of Chautauqua County. One of their registered Holsteins produced 107.6 pounds butterfat during the month. Second place for butterfat went to a cow owned by Mr. I. J. Calkins of Steuben County, with a record of 101.7 pounds. Third place went to an animal owned by Valley Farm of Ulster County, with a production of 99.4 pounds, and fourth place to a Holstein owned by Mr. W. E. Bruyn of Ulster County, with a production of 93.4 pounds.

High Herds for Butterfat

County	Owner	Average Production Per Cow in Milk (lbs)	Fat (lbs)

Hearing on Compensation Insurance Ruling

ON page four you will find an editorial entitled "The New Compensation Law unjust to farmers." Readers who are affected by this ruling will be interested to know that a hearing on the ruling was held January 27, at the office of the Compensation Inspection Rating Board in New York City. A request was made that the new minimum premium which became effective January 1st on logging and lumbering—\$375.00, and sawmills—\$231.00, be revoked, on the grounds that these rates were prohibitive for farmers and the owners of small sawmills. Objection was also made to the provision in the regulation which prohibits cancellation of policies or prorating them. Arguments were presented to show that the rates were prohibitive and that farmers would not be able to pay them. It was shown that farmers had discontinued cutting pulp wood, cord wood and logs since the new rates went into effect.

Private insurance companies handling this business feel they cannot afford to

handle it on any terms considered reasonable by the farmer and small business man. Two suggestions were made to solve the situation, either to set up a state insurance fund to handle this kind of business on reasonable terms or to change the law so that farmers would be permitted to hire a few men for this kind of work without paying compensation. Either of these methods would probably require some new legislation.

The Waterville Tractor School

THE Waterville tractor school was sponsored by the Department of Vocational Agriculture and was held in the week of January 5 to 9. It was advertised by different articles in the local paper and also the two Utica papers, the Press and the Observer. Another way was by cards and circular letters sent out by the teacher of agriculture in Waterville High School. The boys in the department told their parents and neighbors about this. Another way was by taking names of young men and farmers in the community and sending them cards. It was also announced at the Parent-Teacher's Association meeting.

The tractor school was held in the shop of Waterville Central School and there were two instructors from the College at Cornell. Their names were Robert Britt and William Barrett. Mr. Britt runs a large farm in Canandaigua and uses all kinds of tractors. Mr. Barrett runs the large farm at Cornell and he has charge of all the outside crops.

There was no charge for attending this school and I believe most of the farmers will agree that they derived a great benefit from it. In one case there was a man who attended and brought his tractor to have work done on it that would have cost him over \$100 had he taken it to a garage, while in this case all he had to pay was the small sum of the cost of the few parts. There were twenty-four per-

sons attending besides sixteen boys in agriculture who came for two periods each day and twelve boys in shopwork who came for one period each day.

The visitors were: County Farm Bureau Manager, George Bush; Mr. Orrin Terry and T. H. Townsend, editors of the local paper; W. S. Bissell, an International Harvester dealer; and four other local farmers. All together there were eight tractors, three Fordsons, four McCormick Deering 10-20 and one Farmall.

The work that was done in the line of repairing was reseating, facing, and grinding valves, reboring cylinders, repairing driving gears, tightening bearings, adjusting carburetors, timing the engines, checking over clutch, tightening lugs and repairing wheels, and adjusting ignition. This school was of great economic importance to farmers who attended.—LLOYD P. SMITH, Cassville High School Department of Agriculture.

Oleo Ruling Causes Protests

THERE is much excitement among dairymen because oleomargarine manufacturers have been able, through the use of palm oil, to produce yellow oleomargarine without the addition of artificial coloring. It is generally believed that the continued sale of this will result in unfair competition. The present law puts a small tax on uncolored oleo.

Recently, Representative Brigham of Vermont, introduced a bill in the House of Representatives which, if passed, will place a tax of ten cents on every pound of oleomargarine except when it is free from all coloring matter. A companion bill was introduced in the Senate by Senator J. D. Townsend of Delaware. Hearings on the bill have been set for January 2 and 3.

Needless to say, the Brigham bill has the support of dairymen. It will do no harm and may do great good, if you will let your senator and congressman know how you feel about this proposed law.

New York County Notes

STEUBEN COUNTY—Snow is from two to five feet deep on the hill roads. No potatoes moving—prices are from 70 to 75 cents. Potatoes on improved roads are mostly sold. Farmers would like to have all taxes paid direct to the county treasurer or clerk.—D. C. F.

CATTARAUGUS COUNTY—Five county dairymen have been honored by receiving diplomas from the National Dairy Association, for their herds whose average production for the past year has been above 300 pounds of butter fat. The men receiving the awards are J. M. Burdick, Cattaraugus; L. H. Slocum, Little Valley; Leon Wright, Farmersville; C. B. Phillips, Ellicottville; E. B. Clark, Great Valley. All Dairymen's League locals held annual election of officers and listened to a radio broadcast program featuring Governor Franklin D. Roosevelt and President Sexauer of the organization.

Stockholders of the Grange League Federation Exchange met in the City of Olean, February 2nd and chose directors for the coming year. Fine winter weather for all kinds of winter farm work. The ice-harvest is over in most localities. Most of the ice packed was from ten to twelve inches thick. Eggs are cheap, selling for 25c, or even less. Many poultrymen are considering selling off their flocks. Milk prices are falling every month.—M.M.S.

FRANKLIN COUNTY—Another heavy snow storm occurred this week. Thanks to the many motorized snow removal outfits in the county the roads are being kept open in most sections for cars. A few towns still lack modern snow plows but they are getting fewer right along. Saranac Lake reports a snowfall of about forty inches in the past two weeks and constant work has been required to keep roads open there.

Conditions seem better, just now. A big building program, including a new library in Malone is planned and will use much labor. Prices on what we buy are at a new low level. A grain dealer here, who is also a farmer, said recently that grain prices are lower and milk prices higher accordingly than those of eight to ten

years ago and other necessities were, mostly lower priced too. He had been looking over his old records and statements. There is still considerable unemployment but any cases of want are cared for by town or county. A number of old age pensions have been approved for the county lately.

Car shipments of Franklin County potatoes to the central markets are rapidly increasing and it is stated that local buyers hope to establish a steady market by rail shipments. One Malone buyer stated that he had shipped eight carloads during the past month.

Creamery butter now 29c by the tub, print butter 30c, strictly fresh eggs 24c, pea beans \$2.50, fall made cheese 21c, dressed pork 16c-18c, western dressed beef 11c-18c, native dressed beef 8c-10c, veal 16c-18c, live fowl 18c-22c, dressed fowl 28c-32c, potatoes 55c-60c, baled hay \$16-\$19, baled straw \$12-\$13, oats 47c.

An increasing interest is being shown in the Grange and the Dairymen's League, both the business and the social sides. The 4-H Clubs organized last summer have continued their meetings this winter and the boys and girls are getting a great deal of valuable experience in parliamentary usage, conducting meetings and business affairs, as well as the social side of the club meetings.—Mrs. W.R.

GENESEE COUNTY—Snow plows have been busily at work cleaning out the cross roads which were nearly closed to traffic by drifting snow. A warm sun January 26th melted a great deal of the snow and now the cross roads are dangerously icy. The main roads have been kept so clean that they are practically free from ice. Five agronomy and farm management meetings under the auspices of the Farm Bureau were held in Genesee County last week. The principal speakers were Dr. L. Vaughn, Farm Management Department of the State College, who spoke on "The Relative Profitableness of Crops Grown in Genesee County"; and Professor E. L. Worthen of the Agronomy Department whose topic was "What Crops to Grow and How to Grow Them." The meetings were well attended.—Mrs. R.E.G.

How Can I Judge My Ration?

By L. E. WEAVER,
A. A. Poultry Editor

BACK in the days when I first went out as a poultry extension man, almost every County Agent drove a Ford. Many are the times we have been rushing madly across the county to or from a meeting or demonstration

L. E. Weaver

when suddenly "Lizzie" has become balky. I can't recall, however, that we ever had to be towed in. Eventually we always got her started again. There was a regular system of locating the trouble. If the tires and gas were O. K. we looked at the spark plugs and usually had to go no further. But if they were clean and uncracked we went after the coils. And once in a great while it finally turned out to be the timer that was at fault.

I find that many poultry keepers go at their poultry problems in much the same way. However, they are so sure when they fail to get eggs that the fault is in the feed that they never get any farther in their search. They just keep tinkering away at the ration when it is just as likely to be the hens themselves or the house that is at fault. Perhaps the hens have become wormy, or perhaps they are just not the kind that lays eggs in cold weather. Now if that man could have some way of knowing beyond any reasonable doubt that the ration is O. K. he could go on to look for the trouble elsewhere and save himself a great deal of time and cash perhaps. And that is not a difficult thing to do.

Home Mixing Usually Does Not Pay

If one is mixing his own mash and grain he need only know that the formula and the method are recommended by the Experiment Station. If he is feeding a commercial mixture he can judge by the results others are getting. But a better way is to judge by the analysis on the tag or on the bag.

Now let us discuss these sources of evidence, starting with the Experiment Station. The men who work out the formulas have no feed to sell. They are paid to find out the actual facts. The formulas that are put out represent what has been found to be as low in cost as is possible and still be everything that a good ration should be. The recommendations are not made public until they have been tested over and over in the feed pens and their value has been proven.

Unless one has a very large flock and so can buy in quantity and at times when the market is low he will usually find that home mixing does not save him enough to pay for the extra time and trouble. In that case he has two choices. He may buy a commercial feed, or he may have his local feed-dealer mix the ration for him according to the Experiment Station formula. It goes without saying, one must have confidence in the honesty of the dealer, and know that he will use only first class feeds and will not substitute other things for the ones he may be out of at the time.

Commercial Feeds Reliable

As for the many commercial feeds on the market there can be little if any question as to their quality. Where there is such keen competition a feed just has to be good or it will soon be out of the market. Results are what count in the long run. The longer a feed has been on the market the bet-

(Continued on Opposite Page)

Any Farm Woman can have this extra cash!

Right at hand is your opportunity to make more money. You can greatly increase the profits from your chickens by feeding Pearl Grit. It makes hens lay. Often it causes a flock to produce two or three times as many eggs as before.

Pearl Grit is made from the purest, whitest limestone broken into glistening, pearly pebbles. They act as grinding material to help digest food. And the pieces dissolve readily to supply the lime required for health and egg formation.

Right now is the time when hens greatly need Pearl Grit. The season urges them to lay. The best and most valuable hens may break down if they don't have enough lime, for the shell material will be absorbed from a hen's bones if lacking in her diet. You can prevent this, and get many extra eggs, by supplying Pearl Grit.

Take the First Step Today!

Pearl Grit is handled by hatcherymen and feed dealers. If you don't know where to get it locally, send us a dollar for a liberal supply to start you off. But don't delay. Start right now to obtain that extra egg money.

Also be sure to drop us a letter or postal for our book, "The Poultry Raiser's Pay Envelope." It's interesting and valuable. It can easily be worth many dollars to you. We gladly send it for the asking. Write today sure.

(Continued from Opposite Page)

ter is the evidence that it is reliable.

Feed mixtures differ a great deal from each other. Not so much in actual analysis as in the particular kinds of ingredients that go into the mixture, and sometimes in the fineness of grinding. Hens notice these differences and it is a mistake as a rule to change about from one kind to another.

Here are the analyses of two commonly fed commercial rations as given on the tags.

FEED NO. 1

Crude Protein.....	20%
Crude Fat.....	5%
Crude Fiber.....	7%
Nitrogen Free Extract.....	46%
Carbohydrates.....	53%
Contains buttermilk, wheat middlings, meat scrap, corn feed meal, wheat bran, O. P. oil meal, alfalfa meal, soybean meal, gluten feed, steamed bone meal 1% and Calcium Carbonate 1/2%.	

FEED NO. 2

Protein.....	16%
Fat.....	3 1/2%
Fiber.....	50%
N.F.E. Carbohydrates.....	6%
Mineral Matter.....	8%
Contains meat scrap, dried buttermilk, cod liver oil, wheat bran, wheat middlings, ground oats, yellow corn meal, alfalfa leaf meal, O. P. oil meal, corn gluten feed, 1 1/2% bone meal, 1/2% salt, 1% chemically pure Calcium Carbonate.	

Before we begin to examine these feed mixtures let us see if we can determine what a good ration should contain. And in Cornell Bulletin 157 we find this: "As a result of the study of several successful rations for egg production, it seems probable that the standard requirements for laying hens, stated on a percentage of the total food consumed, fall within the range below:

Fiber 3.5 to 5 per cent.
Digestible Protein 12 to 15 per cent, of which from 4 to 5% should be animal protein.
Total Digestible Nutrients 70 to 75 per cent.

It is desirable that the mash contain five or more ingredients, one being a source of animal food.

Judging a Ration

Now with that as a standard how do these feeds measure up? First we notice that the fiber is too high. Fiber is the part of the feed that is hard to digest. A little is needed to give bulk to the mash, but more than 5% seems to be that much too much. Next we see fat listed. The standard says nothing about fat. However it is included under the term "Total digestible nutrients". Fat does not seem to be of any particular importance to the laying hen. A small amount will do no harm but a larger quantity might. And now this matter of Protein. There are two reasons for the rather wide range we see here in the percentages. One is a matter of terms. "Crude Protein" includes all the protein in the feed. But not all of it is actually in a form that the hen can use. So in order to have 12 to 15 percent "digestible" protein as the standard calls for we certainly would want 16% of "crude" protein. Where it merely says Protein on the tag we can take it for granted

(Continued on Page 20)

PROUD OWNER: Yeah! I just had my brakes adjusted!—LIFE.

We shut out the SUN and RAISED 'EM IN THE DARK!

THIS is hard to believe—but true. S. C. W. Leghorn chicks raised on the new Larro Chick Starter in the total absence of sunlight showed an average weight of .85 lbs. at the end of six weeks.

This is .24 lbs. heavier than the standard for that breed raised under normal sunlight, as reported by five State Experiment Stations. That's some record—beating by 1/4 pound the results you are told to expect of birds raised under normal sunlight—and doing it in total absence of sunlight.

Another test at Larro Research Farm with R. I. Reds raised under normal sunlight conditions showed that the new Larro Chick Starter and Larro Growing Mash produced **.44 lbs. more weight** at 24 weeks than the old Larro Starter and Growing Mash.

Think of it, these new Larro Feeds beat the best in the field by .44 lbs. per bird. These bigger framed, better pullets would easily be worth 50¢ more as layers or breeders, but on the basis of weight only (at 30¢ per lb.) they showed **an extra profit of \$27.79 per ton of feed.**

HERE IS WHY

Larro brings you new rations in which all known nutritive requirements are so fitted or dove-tailed together that they function as one harmonious whole. Regardless of seasonal or weather conditions and **without the aid of supplements** at any time, Larro Chick Starter and Larro Growing Mash, fed the simple Larro way, produce the **greatest possible profit over feed cost.**

Ask your Larro Dealer about the complete new line of Larro Poultry Feeds.

BABY CHICKS

HILLPOT

A Liberal Replacement Allowance on All Chicks that Die the First Two Weeks

FREE CHICK BOOK

Hillpot Chicks are backed by 19 years of intensive breeding and an exclusive system of incubation that assures full normal development within the shell. They hatch with the necessary reserve of vitality to pass safely through the hazardous rearing period and attain full maturity quickly. These qualities and their heavy production of fine large eggs make Hillpot Quality Chicks exceptionally profitable to both the commercial poultryman and the small flock owner.

(Continued from Page 19)

that it means crude, not digestible. Of course the manufacturer wants to have it sound just as high as possible.

But why is one of these feeds so much higher than the other in protein? 20% against 16%. The answer is that the No. 2 feed is an all-mash mixture. In No. 1 the protein must be higher to offset the very low protein content of the grain mixture. No. 2 is to be fed just as it is and with no other feed, so the birds will be getting a straight 16% protein, or around 12 to 13% digestible protein. Fairly close to our standard. Along with No. 1 there will be fed an equal amount or more of grain. That will be low in protein. The percent of digestible protein in the entire ration will therefore be none too great.

Fiber and Nitrogen free extract (N. F. E.) together make up the carbohydrates. This is indicated in the No. 2 analysis. The total carbohydrates being 56%. In No. 1 the same thing is told in two ways, perhaps to make it look bigger. Crude fiber 7% and N. F. E. 46% add up to 53%. Perfectly correct.

Aside from the salt and possibly the bone meal there is no advantage in having minerals in the mash. You can get calcium carbonate cheaper in other commercial forms. Both of the feeds have a very good variety.

A Look Ahead

(Continued on Page 1)

than did the consumers of eggs and more poultry has been moved into consumption in the principal markets in 1930 than in 1929. In addition, farm consumption of poultry this year is believed to have been unusually large due to low prices and the tendency of farmers to depend on their own products as much as possible. At any rate, receipts in the last half of 1930 were lighter than in 1929, in spite of the reported increase in spring hatchings.

For 1930 as a whole, receipts of dressed poultry at the four leading markets were about three per cent, or 11 million pounds, less than in 1929. Live poultry receipts at New York City increased about four per cent. With large consumption at the lower price level, and with dealers buying for storage very conservatively because of the losses in the past season, less poultry was placed in storage up to January 1, 1931, than in any of the past six years. On that date, stocks in the entire country totalled only 104,690,000 pounds compared with 140,723,000 on January 1, 1930, and a five-year average on January 1 of 124,779,000 pounds.

The farm price of eggs, as reported monthly by the United States Department of Agriculture, averaged 25.1 cents a dozen in 1930 against 32.1 cents in 1929 which was the highest year since 1925. Chickens averaged 18.5 cents a pound at the farm in 1930 against 22.4 cents in 1929, which was the highest year since 1920. Feed prices also averaged considerably lower. The farm price of one bushel of wheat, one of corn and one of oats combined totalled \$1.97 in 1930 against \$2.35 in 1929, and was the lowest since pre-war days. Prices of feed grains are relatively cheaper than eggs and poultry.

What Is Ahead

Prospects for 1931 for the country as a whole do not promise much improvement in egg prices during the first half of the year. Egg production may not be much changed from the first half of 1930. Usually, low prices for eggs work a natural cure in a short time by influencing many producers to reduce operations and some even to abandon their flocks. This year, however, feed

Genuine Tom Barron Leghorns

Big, fat, fluffy chicks from five-pound breeders, will make you the most profit in large 26 ounce pure white eggs. Pullets laying in five months. prices are low and poultrymen may not find any favorable alternative.

The count of laying hens in the average farm flock on December 1, 1930, indicated an increase of about four tenths of one per cent over December 1, 1929. The early hatchings last spring resulted in a larger proportion than usual of young pullets starting to lay in September. But by early winter the total egg laying capacity of the country's farm flocks was but little in excess of a year ago. Similar information covering commercial flocks containing 400 birds or more is not available.

The effect of the unfavorable 1930 storage egg deal will carry over into the new season. Dealers who stored eggs last season lost heavily and they will not be good customers next spring. In addition, the demand for fine fresh eggs from commercial hatcheries may be less than in 1930 so that more of the fresh production will be available for consumption. The failure of consumer demand for eggs to expand substantially during the last few months when prices have been extremely low is discouraging.

Prospects for poultry meat prices offer more hope for improvement. The carryover of poultry from the 1930 crop will be less than usual so that the market will not have to face another season of such severe pressure from frozen poultry as it did last year. Moreover, low prices have stimulated consumption of poultry.

Both egg and poultry markets in the second half of 1931 are likely to be much more favorable than in the last half of 1930 or the first half of the new year. That conclusion assumes that general business conditions will improve by that time, that production will be somewhat lighter through forcing out some of the inefficient producers, and that dealers will put fewer eggs in storage next spring than in the spring of 1930.

Since egg prices are none too favorable now and the outlook is much better for next fall and winter, it has been suggested that it would be well to reduce flocks and use the feed and effort for the production of early pullets. It seems to be the shrewd thing to do, although not suitable for universal application.

I am a dairy farmer in Brooklyn Township, Susquehanna, County, Pa. Last spring I sent and bought 100 partridge rock baby chicks and raised 95 of them. I have 58 pullets. In the month of December, 1930, they laid 56½ dozen of eggs. Who can beat it? They are a very pretty hen, weight about six pounds, and are very tame.—J. W. Squier.

A flock of Leghorn pullets laying fifty per cent must eat from twenty-four to twenty-five pounds of grain and mash daily. A decline of two pounds of feed from that amount is enough to cause a falling off in egg laying.

THE WHY OF KERR CHICK SUPERIORITY

LAYING inheritance, lusty vigor—these are the outstanding qualities of Kerr's baby chicks.

A rich inheritance from heavy-laying ancestry—a lusty vigor based upon a strong constitution transmitted from heavy producing stock. Baby chicks must have these qualities to make profitable layers.

The inherited prepotency for high egg yields of Kerr chicks has been proved beyond question in the great egg competitions and is now a fixed quality. Unusual care is exercised to guard against parasitic infection and diseases. Kerr chicks are available from B. W. D. tested stock. Send for the new Kerr illustrated Chick Book and prices. Sent free upon request.

WHEN FOOD SOURS . . .

Sweeten the Stomach instantly

About two hours after eating many people suffer from sour stomachs. They call it indigestion. It means that the stomach nerves have been over stimulated. There is excess acid. The way to correct it is with an alkali, which neutralizes many times its volume in acid.

The right way is Phillips' Milk of Magnesia—just a tasteless liquid; pleasant, efficient and harmless. But it kills excess acids. It has remained the standard with physicians for more

than 50 years, and is standard today. It is the quick method. Results come almost instantly. It is the approved method. You will never use another when you know.

Be sure to get genuine Phillips' Milk of Magnesia prescribed by physicians for over fifty years in correcting excess acids. 25c and 50c bottles—any drugstore. The genuine is always a liquid—never made in tablet form. Look for the name Phillips' on wrapper and bottle.

Notes for Home Milliners

Spring Hats Are Already Seen Here and There

DON'T let the icy winter winds and gray winter sky deceive you. It's none too early to begin planning your spring wardrobe, and, most important, that feminine vanity that has become a necessity—the Easter bonnet.

If one were sure it would be read, we should like to make up this whole article of just the word "color", repeating it over and over until the lesson was learned. Never in our lifetime has color been so important nor so strangely and charmingly used. The strong, vivid colors that we shall see and the rich dark ones enlivened with pastels will make a fresh, gay spring.

To be very up to date, choose your spring hat of two colors, or even three.

would find a halo of tiny flat flowers springlike and lovely.

We have not mentioned straws because it still makes us shiver to think of them. However, the large picture hat of straw for country and seashore wear is larger and more picturesque than ever this year, with shallow crown and, need we add, forehead exposed.—**CONSTANCE VON SALZEN.**

NOTE:—If you have any problems about making over, matching costumes, and so forth, write Miss von Salzen c/o American Agriculturist, 461 Fourth Avenue, New York City, who will be glad to help you. Be sure to write her all details so that she can give the best possible advice.

READY-MADE BABY KIMONA NO. B5510 comes in either pink or blue, soft flannel, finished with white binding. "Puppies" are tinted patches of white bunny cloth to be applied on. All necessary materials included in package. Price, \$1.00. Order from Embroidery Department, American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y.

The newest combinations are brown and pale blue, brown and pearl gray, maroon and pale green, light navy and corn-yellow, black and turquoise blue, and brown and white. Other combinations that are always good are dark blue and red, black and pink, black and Nile green, and all the brown and beige shades brightened with orange and yellow.

The newest silhouette is the halo, so called because it frames the face and makes anyone look angelic and pretty. Better still, the home milliner will find it remarkably easy to achieve. The first step is to be sure your felt crown fits your head snugly and is very shallow. All of the forehead should be exposed and no hair must show. Then fluff just a bit of it out at the sides to lie softly on the cheeks.

The halo itself is usually made up of two or three colors contrasting with the crown. One designer uses dark blue felt for the crown and makes a halo of thick strands of red, yellow, and white faille, braided, encircling the hat about two inches above the crownline in front and meeting the crownline at the sides and back.

Another designer rolls grosgrain ribbon over a padding of muslin (which one does not see, of course) and makes a coronet of light green, deeper green, and orange for a black hat.

For the older woman, this same expert makes a small upturned brim of buckram shaped a little higher at the side front than at the sides, and covers it with brown crepe de chine, cut on the bias and finely pleated, on a pearl gray crown. Worn with a light gray coat with dark brown fur collar, one would have an unusual and attractive costume.

Early spring hats will be of felt, satin, faille, moire, and grosgrain ribbon. Sport berets or turbans usually are made of the same material as the costume, i. e., any of the woolsens.

The only feathers we have seen are small breasts, small quills, or a bit of tip feather.

To go back to the halo, for a moment, any woman, miss, or child,

Tested Recipes

Meat Salad

6 lbs. very tender meat of any kind desired. Put through food chopper, not too fine. 1½ lbs. nut meats broken or cut not too small, 2 bunches celery, cut up into dice, (that is, the tender portions) and 1 quart of choice home made mayonnaise stirred all through it. This was served at an afternoon gathering or party.—**A. B. G.**

Peanut Cabbage Salad

Shred cabbage very fine. Have peanuts ground fine through food chopper. Place in dish a layer of cabbage, then a layer of peanuts, and so on until you have the quantity desired. Season to one's taste and stir plenty of home-made mayonnaise all through it thoroughly. Serve with the ground peanuts on top.—**A. B. G.**

Old Hosiery Easily Cut

Rugs are being hooked, knit and crocheted from silk hose. To facilitate cutting these, use sharp, small shears. Open up the top of the hose, cut off the foot above the heel, pull the heel end on over the neck of a quart bottle, pull clear up over the bottom of the bottle, half an inch, begin cutting. Pull up all the while as you cut to keep half an inch to work on; the bottle rolls around and is handy to turn as you work.—**MRS. J.**

To prevent flatiron marks from showing when ironing silk, place a piece of white paper between the material and the iron, moving it along over the entire pressing surface.

Feather Circle Quilting Pattern

EVERY quilt requires a quilting pattern and probably the feather circle is the most popular design that is used. These perforated patterns are made on tough durable paper and may be used over and over again. All you have

to do is to wipe over the design with a piece of cotton dipped in stamping paste and the design will be transferred to your material ready to quilt.

The feather circle may be had in 3, 6, 8, 10, or 14 inch diameter. Order by No. M253 and specify the size wanted.

Stamping wax, either black or yellow, comes in a box with enough to stamp many times as No. 206.

M253 Perforated Pattern Feather Circle, any size 25 cents; M206 Box of Stamping Wax 25 cents.

Order from Embroidery Dept., American Agriculturist, 10 N. Cherry St., Poughkeepsie, New York.

Aunt Janet's Corner

Will Your Experience Help This Reader?

I have thought some time of writing to our household page, but I felt I had an awkward problem to present; one that might call forth smiles from persons who do not seem to have such worries. I may sound silly, but this is nearly tragic to me and I do hope I may get some suggestions from readers.

I have come under the list of homemakers for over five years. Before I entered this profession, I had work that gave no training in household arts. I was always a farm girl and now am a farmer's wife. I have two girls aged three and five. While a girl I had big ideas of keeping house—how I would clean, cook, sew, garden, raise chickens, etc., etc. Now, law me! I seem to hurry all day and am minutes behind with some things and days behind with others. Really, I know I do not have so much to do to keep me so busy. I just need a boss, a schedule, a twenty-six hour day or something.

I will try to list a few of the necessary things I do every day:—Get up in time to get house warmed and breakfast by seven o'clock. Then it takes about one-half hour to tend poultry, carry coal, water and wood. By that time the girls need a little help with dressing, their breakfast is fixed and I am ready to wash dishes and cream separator.

I churn on Tuesday, Thursday, and Saturday. I usually bake bread on Tuesday. I use a gasoline washer in summer and the board in winter.

We are living in four heated rooms this winter and have a large room and whole upstairs and third floor left to be swept and dusted. I have a good hand, (motor driven) sweeper.

My husband is wonderful to provide

any cleaning helps, or such, that I need, but never helps me any with labor. I am anxious to get at the summer sewing, but days are pretty full without.

Can some reader offer a plan of work so that it could be followed day by day and allow time, somewhere, for the extra things that come up?

—A READER OF THE HOME PAGE.

NO doubt there are Corner readers who have worked out a scheme that would help this struggling friend. She really has put before us one of the greatest problems in any business, namely, that of the wise use of time. It shows she is *thinking* about her job and where a woman sincerely and earnestly tries to analyze her work to see

For Mature Figures

2955

Dress Pattern No. 2955 is particularly suitable for mature figures because of its wrapped front movement. Crepe silk in dark colors with light contrasting trimming band would be very desirable. Patterned and plain crepe wools are also very smart for general day occasions for this pattern which cuts in sizes 36, 38, 40, 42, 44 and 46 bust measure. Size 36 requires 4½ yards of 39-inch material with ½ yard of 27-inch contrasting. Price, 15c.

where it can be improved, there is hope for improvement.

When the source of trouble has been located, a cure can usually be effected. So, just to encourage our readers in giving the subject serious consideration, we shall pay \$3.00 for the best letter not over 300 words in length, \$2.00 for the next best, and \$1.00 for all others we can find room to print. Before March 8th address your letters to Aunt Janet, c/o American Agriculturist, 461 Fourth Ave., New York City.

To re-stiffen glazed chintz shades, use a coat of white shellac. Do not brush over the shellac twice, for if you do it will gum. It is safest never to use a hot iron on this fabric.

Amazing

what perfection Calumet's Double-Action brings to baking

HOT, tender muffins—that men rave about and gobble up. Golden brown cakes—with an unusual delicacy, a smoothness of texture that makes you proud to cut them.

That's the kind of perfection Calumet's Double-Action brings. Extraordinary perfection! Such sure, easy baking success that women everywhere are talking about Calumet—praising it to the skies—asking their friends to try it. No wonder Calumet is *the largest-selling baking powder in the world to-day*.

How does Calumet's wonderful Double-Action work? Like this: in the mixing bowl, the *first* action begins. It starts the leavening properly. Then, in the oven, the *second* action starts. It carries on the leavening. Up!... up!... it keeps raising the batter and holds it high and light. Your cake bakes beautifully, even though you may not be able to regulate your oven temperature with utmost accuracy.

SEE CALUMET'S DOUBLE-ACTION

Make this test—See for yourself how Calumet Baking Powder acts *twice* to make your baking better. Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's *first* action—the action that Calumet specially provides to take place in the mixing bowl.

After the mixture has entirely stopped rising, stand the glass in a pan of *hot* water on the stove. In a moment, a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's *second* action—the action that Calumet holds in reserve to take place in the heat of your oven. Make this test to-day. See Calumet's *Double-Action* which protects your baking from failure.

© 1931. G. F. CORP.

Pure! Economical! All baking powders are required by law to be made of pure, wholesome ingredients. But not all are alike in their action nor in the amount that should be used. And not all will give you equally fine results in your baking. Calumet is scientifically made of exactly the right ingredients, in exactly the right proportions to produce *perfect* leavening action—Double-Action.

Enjoy new baking triumphs—try Calumet. Remember to use only *one* level teaspoon to each cup of sifted flour. This is the usual Calumet proportion and should be followed for best results—a splendid economy!... Mail coupon for the wonderful new Calumet Baking Book.

Calumet is a product of General Foods Corporation

Fill in completely.—print name and address

Girl's Jumper dress Pattern No. 2965 is as delightful as it is practical. Made of light weight woolen jersey or of cotton broadcloth it will serve for almost any purpose. Coral pink for the dress and white for the blouse would be most becoming. The pattern cuts in sizes 6, 8, 10 and 12 years. Size 8 requires 1½ yards of 39-inch material with 1½ yards of 35-inch contrasting for blouse and 1½ yards of binding. Price 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps. (Don't send coin). Add 12c for one of the new Spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

2965

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David's latest escapade is the release of a crow that Perry Larson had captured by endless patience and staked out in the cornfield to keep other crows away.

David is lonely but a new friend cures this trouble. Blind Joe Glaspell, who plays the violin, arouses David's sympathy and he loans Joe his father's violin. Soon David makes another acquaintance, Miss Holbrook. He names her "The Lady of the Roses."

David meets "Jack and Jill" when they rescue him from a rough and tumble scrap with a gang of boys who are tormenting Jill's kitten.

David goes home with Jack and Jill. It appears that Jack and the Lady of the Roses are not on friendly terms.

His lady seems very unhappy and David tried to convince her that she will be happier if she will only *think* something pleasant is going to happen.

Why, Lady of the Roses, he's even seen this—all this here. I told him about it, you know, right away after I'd found you that first day; the big trees and the long shadows across the grass, and the roses, and the shining water, and the lovely marble people peeping through the green leaves; and the sundial, and you so beautiful sitting here in the middle of it all. Then I played it for him; and he said he could see it all just as plain! And *that* was with his inside eyes! And so, if Joe, shut up there in his dark little room, can make his *think* bring him all that, I should think that *you*, here in this beautiful, beautiful place, could make your *think* bring you anything you wanted it to."

But Miss Holbrook sighed again and shook her head.

"Not that, David, not that," she murmured. "It would take more than thinking to bring—that." Then, with a quick change of manner, she cried: "Come, come, suppose we don't worry any more about *my* hours. Let's think of yours. Tell me, what have you been doing since I saw you last? Perhaps you have been again to—to see Mr. Jack, for instance."

"I have; but I saw Jill mostly, till the last." David hesitated, then he blurted it out: "Lady of the Roses, do you know about the gate and the footbridge?"

Miss Holbrook looked up quickly.

"Know—what, David?"

"Know about them—that they're there?"

"Why—yes, of course; at least, I suppose you mean the footbridge that crosses the little stream at the foot of the hill over there."

"That's the one." Again David hesitated, and again he blurted out the burden of his thoughts. "Ladys of the Roses, did you ever—cross that bridge?"

Miss Holbrook stirred uneasily.

"Not—recently."

"But you don't *mind* folks crossing it?"

"Certainly not—if they wish to."

"There! I knew 't wasn't your blame," triumphed David.

"My blame!"

"Yes; that Mr. Jack wouldn't let Jill come across, you know. He called her back when she'd got halfway over once."

Miss Holbrook's face changed color.

"But I do object," she cried sharply. "To their crossing it when they *don't* want to! Don't forget that, please."

"But Jill did want to."

"How about her brother—did he want her to?"

"N—no."

"Very well, then. I didn't, either."

David frowned. Never had he seen his beloved Lady of the Roses look like this before. He was reminded of what Jill had said about Jack: "His face was all stern and white, and his lips snapped tight shut after every word." So, too, looked Miss Holbrook's face; so, too, had her lips snapped tight shut after her last words. David could not understand it. He said nothing more, however; but, as was usually the case when he was perplexed, he picked up his violin and began to play. And as he played, there gradually came to Miss Holbrook's eyes a softer light, and to her lips lines less tightly drawn. Neither the footbridge nor Mr. Jack, however, was mentioned again that afternoon.

CHAPTER XVII

"THE PRINCESS AND THE PAUPER"

It was in the early twilight that Mr. Jack told the story. He, Jill, and David were on the veranda, as usual watching the towers of Sunnycrest turn from gold to silver as the sun dropped behind the hills. It was Jill who had asked for the story.

"About fairies and princesses, you know," she had ordered.

"But how will David like that?" Mr. Jack had demurred. "Maybe he doesn't care for fairies and princesses."

"I read one once about a prince—it was 'The Prince and the Pauper,' and I liked that," averred David stoutly.

Mr. Jack smiled; then his brows drew together in a frown. His eyes were moodily fixed on the towers.

"Hm-m; well," he said, "I might, I suppose, tell you a story about a *Princess* and—a *Pauper*. I—know one well enough."

"Good!—then tell it," cried both Jill and David. And Mr. Jack began his story.

"She was not always a Princess, and he was not always a Pauper,—and that's where the story came in, I suppose," sighed the man. "She was just a girl, once, and he was a boy; and they played together and—liked each other. He lived in a little house on a hill."

"Like this?" demanded Jill.

"Eh? 'Oh—er—yes, *something* like this," returned Mr. Jack, with an odd half-smile. "And she lived in another bit of a house in a town far away from the boy."

"Then how could they play together?" questioned David.

"They couldn't, *always*. It was only summers when she came to visit in the boy's town. She was very near him then, for the old aunt whom she visited lived in a big stone house with towers, on another hill, in plain sight from the boy's home."

"Towers like those—where the Lady of the Roses lives?" asked David.

"Eh? What? Oh—er—yes," murmured Mr. Jack. "We'll say the towers were something like those over there."

He paused, then went on musingly: "The girl used to signal sometimes, from one of the tower windows. One wave of the handkerchief meant, 'I'm coming over'; two waves, with a little pause between, 'meant,' 'You are to come over here.' So the boy used to wait always, after that first wave to see if another followed; so that he might know whether he were to be host or guest that day. The waves always came at eight o'clock in the morning, and very eagerly the boy used to watch for them all through the summer when the girl was there."

"Did they always come, every morning?" asked Jill.

"No; sometimes the girl had other things to do. Her aunt would want her to go somewhere with her, or other

cousins were expected whom the girl must entertain; and she knew the boy did not like other guests to be there when he was, so she never asked him to come over at such times. On such occasions she did sometimes run up to the tower at eight o'clock and wave three times, and that meant, 'Dead Day.' So the boy, after all, never drew a real breath of relief until he made sure that no dreaded third wave was to follow the one or the two."

"Seems to me," observed David, "that all this was sort of one-sided. Didn't the boy say anything?"

"Oh, yes," smiled Mr. Jack. "But the boy did not have any tower to wave from, you must remember. He had only the little piazza on his tiny bit of a house. But he rigged up a pole, and he asked his mother to make him two little flags, a red and a blue one. The red meant 'All right'; and the blue meant 'Got to work'; and these he used to run up on his pole in answer to her waving 'I'm coming over,' or 'You are to come over here.' So, you see, occasionally it was the boy who had to bring the 'Dead Day,' as there were times when he had to work. And by the way, perhaps you would be interested to know that after a while he thought up a third flag to answer her three waves. He found an old black silk handkerchief of his father's, and he made that into a flag. He told the girl it meant 'I'm heart-broken,' and he said it was a sign of the deepest mourning. The girl laughed and tipped her head saucily to one side, and said, 'Pooh! as if you really cared!' But the boy stoutly maintained his position, and it was that, perhaps, which made her play the little joke one day."

"The boy was fourteen that summer, and the girl thirteen. They had begun their signals years before, but they had not had the black one so long. On this day that I tell you of, the girl waved three waves, which meant, 'Dead Day,' you remember, and watched until the boy had hoisted his black flag which said, 'I'm heart-broken,' in response. Then, as fast as her mischievous little feet could carry her, she raced down one hill and across to the other. Very stealthily she advanced till she found the boy bent over a puzzle on the back stoop, and—and he was whistling merrily."

"How she teased him then! How she taunted him with 'Heart-broken, indeed—and whistling like that!' In vain he blushed and stammered, and protested that his whistling was only to keep up his spirits. The girl only laughed and tossed her yellow curls; then she hunted till she found some little jingling bells, and these she tied to the black badge of mourning and pulled it high up on the flagpole. The next instant she was off with a run and a skip, and a saucy wave of her hand; and the boy was left all alone with an hour's work ahead of him to untie the knots from his desecrated badge of mourning."

"And yet they were wonderfully good friends—this boy and girl. From the very first, when they were seven and eight, they had said that they would marry each other when they grew up, and always they spoke of it as the expected thing, and laid many happy plans for the time when it should come. To be sure, as they grew older, it was not mentioned quite so often, perhaps; but the boy at least thought—if he thought of it all—that that was only because it was already so well understood."

"What did the girl think?" It was Jill who asked the question.

"Eh? The girl? Oh," answered Mr. Jack, a little bitterly, "I'm afraid I don't know exactly what the girl did think, but—it wasn't that, anyhow—that is, judging from what followed."

"What did follow?"

"Well, to begin with, the old aunt died. The girl was sixteen then. It was in the winter that this happened, and the girl was far away at school. She came to the funeral, however, but the boy did not see her, save in the distance; and then he hardly knew her, so strange did she look in her black dress and hat. She was there only two days, and though he gazed wistfully up at the gray tower, he knew well enough that of course she could not wave to him at such a time as that. Yet he had hoped—almost believed that she would wave two waves that last day, and let him go over to see her."

"But she didn't wave, and he didn't go over. She went away. And then the town learned a wonderful thing. The old lady, her aunt, who had been considered just fairly rich, turned out to be the possessor of almost fabulous wealth, owing to her great holdings of stock in a Western gold mine which had suddenly struck it rich. And to the girl she willed it all. It was then, of course, that the girl became the Princess, but the boy did not realize that—just then. To him she was still 'the girl.'"

"For three years he did not see her. She was at school, or traveling abroad, he heard. He, too, had been away to school, and was, indeed, just ready to enter college. Then, that summer, he heard that she was coming to the old home, and his heart sang within him. Remember, to him she was still the girl. He knew, of course, that she was not the *little* girl who had promised to marry him. But he was sure she was the merry comrade, the true-hearted young girl who used to smile frankly into his eyes, and whom he was now to win for his wife. You see he had forgotten—quite forgotten about the Princess and the money. Such a foolish, foolish boy as he was!"

"So he got out his flags gleefully, and one day, when his mother wasn't in the kitchen, he ironed out the wrinkles and smoothed them all ready to be raised on the pole. He would be ready when the girl waved—for of course she would wave; he would show her that he had not forgotten. He could see just how the sparkle would come to her eyes, and just how the little fine lines of mischief would crinkle around her nose when he was ready to give that first wave. He could imagine that she would like to find him napping; that she would like to take him by surprise, and make him scurry around for his flags to answer her."

"But he would show her! As if she, a girl, were to beat him at their old game! He wondered which it would be: 'I'm coming over,' or, 'You are to come over here.' Whichever it was, he would answer, of course, with the red 'All right.' Still, it *would* be a joke to run up the blue 'Got to work,' and then slip across to see her, just as she, so long ago, had played the joke on him! Oh the whole, however, he thought the red flag would be better. And it was that one which he laid uppermost ready to his hand, when he arranged them."

"At last she came. He heard of it at once. It was already past four o'clock, but he could not forbear, even then, to look toward the tower. It would be like her, after all, to wave then, that very night, just so as to catch him napping, he thought. She did not wave, however. The boy was sure of that, for he watched the tower till dark."

"In the morning, long before eight o'clock, the boy was ready. He debated for some time whether to stand out of doors on the piazza, or to hide behind the screened window, where he could still watch the tower. He decid-

Just David

(Continued from Page 24)

to let her see him when she looked toward the house; then his triumph would be all the more complete when he dashed out to run up his answer.

"Eight o'clock came and passed. The boy waited until nine, but there was no sign of life from the tower. The boy was angry then, at himself. He called himself, indeed, a fool, to hide as he did. Of course she wouldn't wave when he was nowhere in sight—when he had apparently forgotten! And here was a whole precious day wasted!

"The next morning, long before eight, the boy stood in plain sight on the piazza. As before he waited until nine; and as before there was no sign of life at the tower window. The next morning he was there again, and the next, and the next. It took just five days, indeed, to convince the boy—as he was convinced at last—that the girl did not intend to wave at all."

"But how unkind of her!" exclaimed David.

"She couldn't have been nice one bit!" decided Jill.

"You forget," said Mr. Jack. "She was the Princess."

"Huh!" grunted Jill and David in unison.

"The boy remembered it then," went on Mr. Jack, after a pause,— "about the money, and that she was a Princess. And of course he knew—when he thought of it—that he could not expect that a Princess would wave like a girl—just a girl. Besides, very likely she did not care particularly about seeing him. Princesses did forget, he fancied,—they had so much, so very much to fill their lives. It was this thought that kept him from going to see her—this, and the recollection that, after all, if she really *had* wanted to see him, she could have waved.

"There came a day, however, when another youth, who did not dare to go alone, persuaded him, and together they paid her a call. The boy understood, then, many things. He found the Princess; there was no sign of the girl. The Princess was tall and dignified, with a cold little hand and a smooth, sweet voice. There was no frank smile in her eyes, neither were there any mischievous crinkles about her nose and lips.

AN IDEA A DAY KEEPS THE SHERIFF AWAY

IF ONE single idea from your day's reading sticks in your mind, and becomes helpful to you, that day's reading has not been in vain.

There is a wealth of material in this publication. The reading columns are replete with teachings and helpful suggestions. You are entertained and instructed, otherwise you would not be a subscriber. But do you not find in the advertising columns suggestions and ways of doing things that are also of profit to you?

You cannot appropriate to your own beneficial use everything you read. But somewhere, every day, both in the reading columns and the advertising columns are matters so personal and helpful to you that you cannot afford to pass them by unnoticed.

You should make it a habit to read the advertisements as consistently and carefully as you read any other part of your paper. Make it a habit. Read with an inquiring and receptive mind. It will pay you well.

The man who consistently reads all parts of his paper keeps in the van of today's grand march of progress. He becomes a wise buyer. He knows what new things are suited to his needs, and what they are worth. He is not easily imposed upon, and he never makes purchases at random.

New England Tries to Solve Its Milk Problem

(Continued from Page 3)

the Vermont cooperatives which join will have one representative and one director. The NEMPA will have as many representatives and as many directors as the cooperative creameries combined. It seems probable at the start that there will be about 10 representatives of creameries which would also give the NEMPA 10 voting representatives. This insures an equal balance of power and authority between the two main groups.

Provision is made in the contract for an immediate pooling of the milk which comes from up-country stations. This will provide for an immediate adjustment of prices so that all milk producers shipping into Boston will get the same price, irrespective of the surplus which their dealer or cooperative has been carrying. This pooling of price will do away with the chief cause of the present disastrous competition in the market. It is the plan of the Central Marketing Agency to follow this pooling of the Boston milk supply with a pooling of the milk going into lesser markets on a basis which will be fair and equitable to producers near to and far away from these markets. It is impractical at the present time to include these lesser markets in a general pool as the producers which supply them have evened up their production to meet the demands of the market while the producers in Northern New England still have a wide variation between summer and winter production.

Has Support of Dairymen

In developing the central marketing agency plan the wishes of all of the various groups have been consulted. Commissioner E. H. Jones of Vermont, Dr. H. P. Young of the University of Vermont and W. P. Davis of the NEMPA have visited most of the boards of directors of these creameries and have talked the matter over with them. In many cases certain changes to meet special problems were suggested. These have been embodied in the final draft of the bylaws and contract which are now in the hands of the cooperatives for actual signature.

The Central Marketing Agency plan has been in the minds of some of the leaders for a long time past. It has now come to the front. Apparently the dairymen believe that something of this kind should be done in order to stabilize milk prices and prevent any such situation as exists at present in Boston. Commissioner Jones has stated frankly that if such an overhead organization had been in effect six months ago there would have been no need of the Boston price going below eight cents. It is now at seven with a prospect of going to six cents, because of the highly competitive conditions which exist. There is considerable milk now being offered for sale in Boston at six cents and some is reported at even lower figures. The low point to which the milk price has gone is the direct result of competition of organized groups of dairymen, handling 97

per cent of the milk. The leaders believe that the central marketing agency will prevent any such disasters in the future.

A Personal Experience in Forestry

A GOOD wood lot thriftily managed, is a valuable asset to any farm. In the East most of our farms contain some land which is low and wet, irregularly shaped or poor. Certainly, it is worth considering to plant trees on a few acres. In the end the poorest of such land should result more profitably than to continue to crop it or use it for pasture. Even a remote corner of the farm often is to be considered.

Besides the seedlings and transplants, mostly evergreens, from two to four years old, furnished by New York State, at nominal cost, private nurseries also supply good stock of hardwoods and other varieties at reasonable prices. We find twelve hundred trees set six feet apart both ways will plant an acre. The ground need not be plowed. The planting is easy. Simply take a spade or sharp tool, cut the sod, press it back so as to make a crack or opening, put the root of the small tree in the opening and press the sod back by stepping on it.

Many prefer spring to fall planting. Involved in this is the matter of heaving by frosts, condition of the surface of the ground and time available for the work. After the trees are set, usually little care is required. But, the planting should be fenced to prevent stock from eating off the growth. New York and other states have preferential laws respecting taxation of forest plantings.

We planted our first forest trees twelve years ago on undesirable land in a corner of the farm, increasing the same since. The first trees planted are today a thick growth of various kinds of evergreens and disiduous (hard and soft wood) trees, mostly native. Many are now about six inches through the butt and at least forty feet tall. Already we have begun to thin out for Christmas trees and other purposes. Forest plantings should continue to increase in interest and value as a practical part of any well rounded farm unit. Moreover, there is connected a certain satisfaction not easily definable, but, nevertheless, real.—Frank N. Decker.

The farmers' almanac was made famous by Benjamin Franklin. At the present time, the number of farm almanacs published along these lines are very few.

One has just come to our desk, namely, Armour's farmers' almanac, which we believe will be of great interest to our readers. Any who are interested will be able to secure one of these from any local dealer handling Armour's fertilizers, or write Armour Fertilizer Works, Chicago, Ill.

"H'm, Doctor, seems to be a major operation."—LIFE.

Too Much Nerve

I am a subscriber and wish to mention what sportsmen some hunters are. My farm is properly posted as far as I know. The last of December three hunters parked their car in road in front of my residence. A pheasant flew across the road in front of them and went over into my apple orchard. They took their dog, went over, and shot at pheasant twice, but missed getting him. I went and told them the property was posted and ordered them out. They said first they did not see the signs, then they told me I was not properly posted and that my signs did not amount to anything.

They lost their dog. I paid \$1.20 for advertising him and kept the dog three days. One of the hunters sent his wife after the dog and I asked her \$4.50. She thought

months old. However, when the pedigree came it showed that the rabbit was only 2 months old.

I finally got a shipment of rabbits ready and sent for shipping tags, and instead of shipping tags I got a blank to fill out which was so strict that no man living could ship rabbits to them.

You can print this if you wish. I merely want to say that it has cost me about \$300 to date and I cannot get rid of the rabbits even though I offered to give them away."

"Pioneering"

QUITE a number of our subscribers have asked for information about the Pioneer Oil and Gas Company. We have been informed that this company had a salesman who attempted to induce 120 men in a locality to buy 100 gallons of motor oil, each at \$1.00 a gallon, after which they agree to set up a distributing station. In other words, it is necessary for each prospect to put up the \$100 first, in order to get the station.

We do not know just what inducement the salesman put up, but it is, of course, possible to buy several

Gets Pay for Eggs

WE have received our payment for the case of eggs and are very pleased about it. We feel greatly indebted to the Service Bureau and appreciate your helping us very much. We surely would never have received the check without your aid.

You are doing a great service to the farmers in many ways. We read of it in different places. We will not be slow in broadcasting your good work, you may well believe.

The AMERICAN AGRICULTURIST will always have a place in our home.

this was a ridiculous amount to pay and said if she went to law about it she would not have to pay only for the advertising because the dog was running around with a rope on and she said I had him tied up. So I let her have him for \$3.00.

WE have absolutely no sympathy for trespassers who ignore property rights, but we believe that the farmer will lose nothing and gain much by allowing the courteous sportsman to hunt on his premises. There is altogether too much of a tendency, however, for hunters to feel that farmers have no rights at all. Our subscriber could have made these trespassers plenty of trouble. Hunting on posted land is a violation of the Conservation Law, punishable by fine. In several cases recently where local officers have failed to secure a conviction the New York State Conservation Department, at our suggestion, has turned over evidence to the Attorney General's office who have secured a conviction.

Incidentally, we are greatly interested in the letterhead from our subscriber's letter. It shows a fine old farmstead which has been in the family since 1849 during which time it has belonged to grandfather, son, and grandson.

A Personal Experience With Rabbits

WE have consistently advised against accepting any livestock with the hope of selling back offspring to the person from whom they were bought. The following personal experience has been sent by one of our subscribers and will help to emphasize our warning.

"To make a long story short, I ordered a trio of rabbits at \$35.00 which were supposed to come express prepaid. Well, after ordering them, I got rather weak in the knees about them so I wrote your Service Bureau to find out about them.

When the rabbits came there were \$4.70 express charges on them. In place of paying the express they had put in a rabbit about 2 months old which died the same night I got them. I wrote to them about it and told them about the charges and to make it right, they sent me another rabbit collect, 93c, claiming it to be 4

brands of good motor oil for this price without putting up any \$100 in advance. Any of our readers who are approached with this proposition, might be interested in first writing to the Syracuse Better Business Bureau of Syracuse, New York, who have some information about this company.

Another Advance Fee

What can you tell us about the Mutual Outdoor Advertising Concern, Illinois? They want me to act as their local distributor but before I do this they want me to pay \$10. down, \$10. in thirty days, and \$5. in 60 days. Would you advise me to do this?

JUST as this letter was received we learned from the National Better Business Bureau that the Post Office Department had just issued a fraud order against the Mutual Outdoor Advertising Concern. As we understand the proposition this concern advertised in employment wanted columns. Those who answered the ad were told that their distributors of advertising matter in all parts of the country make from \$1500 to \$4000 a year.

The hitch in the proceedings were that the Mutual Outdoor Advertising Concern asked prospects for \$10. called a registry fee. The contract, we understand, did not guarantee any particular amount of work; in fact, about all that was definitely promised was that the one who sent the \$10. would get his name and address listed in a "distributors' directory." According to evidence presented by the Post Office Department, persons registering with this

Nabs Chicken Thieves

Having had a little experience with chicken thieves on the night of December 29, thought I would like to write you about it. The thieves entered the henhouse by pounding the hasp off the door. They also tore the woven wire fence down so as not to come in contact with a barbed wire fence. On counting I found thirty-two missing. I immediately got in touch with the Sheriff at Owego and ask-

Help When Help Was Needed

I RECEIVED the North American Accident Insurance Company's draft for \$50.00 which you sent me and I assure you it gives me great pleasure to acknowledge same.

It certainly was a great help and almost unexpected. To be frank I was very uncertain as to whether I would receive it or not.

It hardly seems possible to secure so much protection for so small a price. It was the first and I sincerely hope the last time I shall need assistance along that line. I will surely keep this insurance up. Thanking you for the courtesy shown me, I am

Yours truly
Arthur E. Cone,
R. F. D. No. 2 Box 15
East Hampton, Conn.

Have You a Friend in This List ?

ARE you personally protected should another car hit you and injure you, or should you be injured by a travel accident? The Editorial Staff of American Agriculturist believes in insurance. We believe in life insurance, fire insurance, liability insurance on the car you drive, and last but not least, in personal accident insurance. We are proud of the low cost travel accident insurance policy we have made available to our readers. The North American Accident Insurance Company, is a thoroughly reliable company, and is licensed to do business by the New York State Insurance Department. The one dollar policy of course, is limited but, we maintain, gives full value and more too, for what it costs.

If you live in Oneida County you will know some of those listed below who have collected indemnities on policies held with the North American Accident Insurance Company.

ed him to notify the police at Endicott and Johnson City to watch the markets, as it was market day at those places.

Around eleven o'clock on December 30, I received a call from the police at Endicott saying he was holding two men with six bags of Plymouth Rock chickens. I drove to Endicott. Upon seeing the hens I recognized them as I had a little trouble with the leg bands cutting in their legs and some hadn't yet all healed up. Upon being questioned by the State Troopers the men finally confessed taking them.

Four hens were dead as a result of being kept in the bags so long. These two men are now in jail awaiting the action of the Grand Jury. This makes three times I have lost hens. Is there any reward leading to the conviction of chicken thieves. I had read such in your paper some time ago.

IF figures could be collected showing the total loss to poultrymen from chicken stealing the figures would be staggering. We particularly commend to our readers, the action of this subscriber in reporting the theft immediately and in asking market men to watch to see if these birds were offered for sale.

Too often, in our opinion, poultrymen assume that there is no chance of catching the thieves and neglect to report the loss. Prompt action enables the authorities to catch at least a certain number of the thieves, centers public attention on the seriousness of the situation, and where convictions are secured, warns the thieves that chicken stealing is not a safe occupation.

So far as the rewards are concerned, American Agriculturist did pay quite a number of awards for information leading to the arrest and conviction of chicken thieves, but the offer of this reward was discontinued some time ago, and definite announcement of this was made in the columns of American Agriculturist.

Unordered Merchandise

THE unordered merchandise nuisance cannot flourish unless a considerable number who receive goods pay for them. If you receive a fountain pen, a neck tie, stick pin, or a pair of socks, which you did not order, write the sender a letter reading something like this:

"Goods received. I do not want them, and will be glad to return them to your duly authorized representative on payment to me of \$1. for storage of same."

If everyone would follow this plan, the unordered goods nuisance would soon die out.

REDUCE COSTS INCREASE PROFITS with RED STEER

Look for
this tag

LET'S see how they figure it—these thousands of farmers who hold production costs down to a minimum by using Red Steer.

They know that this year, as every year, their profits will depend largely upon their cost of production per acre. And that every dollar they can cut from these costs will automatically increase their profits.

The first step is to get larger yields per acre, thereby reducing the cost per bushel, or whatever the unit of production. This applies to pastures also, where yield and feeding quality are very important.

To do this, you must use good fertilizer. A fertilizer that gives you full dollar for dollar value in *productive* plant food. A fertilizer made only of the *best materials*, uniform in quality and analysis throughout the bag, and backed up by the name of a manufacturer you can depend upon.

Swift's Red Steer is that fertilizer! You will recognize it by the Certificate of Quality attached to every bag.

In addition to the usual "guaranteed analysis" tag, this certificate gives positive

assurance of highest quality—"Best Materials, Double Mixed and Triple Tested." And that means better yields of premium grade products for you.

To cut production costs, increase profits, make it a point to look for the Certificate of Quality when you buy fertilizer.

Here's another way to cut costs! When you talk with your Authorized Swift Agent about Red Steer, ask him about high analysis, especially 8-24-8 or 8-16-14. You can save 10% to 15% or more on the cost of your plant food by using Swift's Red Steer high analysis.

SHRINES OF AMERICA

To Abraham Lincoln

FROM humble log cabin to first mansion of the land; from obscure barefoot boy to one of the world's noblest statesmen and humanitarians. The greatness of Lincoln is no farther beyond the power of words than was the humbleness and pure simplicity of his soul. Shrines to his memory are legion. The statue in Lincoln Park, Chicago, (left) is one of the best. The Lincoln Memorial in Washington (below) is one of the beauty spots of the world.

Farm Equipment Week, February 16-21 See Page 3

(Below) 12 BBL. MORE PER ACRE: Moore Brothers (at right and left), Freehold, Monmouth Co., N. J., standing in their ten-acre potato field, which averaged 300 bu. to the acre last season, 20 per cent better than the local average. In a test of "AA QUALITY" Fertilizer against another make, Mr. William Moore reports, "Your fertilizer beat the other by more than 12 bbls. to the acre—same seed, spraying, cultivating, etc." (Sept. 29, 1930)

(Right) 13 TONS MORE PER ACRE: Mr. Ernest O. Havens, Ogdensburg, St. Lawrence Co., N. Y., and his son Oris, examining some of the fine ears from his 1930 corn crop. Mr. Havens found that "AA QUALITY" Fertilizer gave him 20 tons of silage to the acre, instead of 7, which was all he got from the unfertilized field. This increased yield cut his production cost at least one-half.

13 Tons More Per Acre

(Left) 60% ABOVE AVERAGE YIELD: Onions grown by Smith-Canastota, Inc., Canastota, Madison Co., N. Y., averaged 800 bu. to the acre—60 per cent more than the local average. Mr. Claude R. Coulter, Farm Manager, shown in the photograph, says: "The high yield in this year of severe drought speaks well for 'AA QUALITY' Fertilizer." (Oct. 4, 1930.)

EVERY dollar saved on the cost of growing ensilage or other roughage is a dollar of extra profit for the farmer. Here are facts from Mr. Ernest O. Havens, of Ogdensburg, N. Y., which show how these extra dollars are made. Mr. Havens writes:

"The difference between success and failure has been demonstrated to me this year in raising my corn. The farmer's big problem is to keep down the cost of crop-production and overcome unfavorable weather conditions. I grew some of my crop with and some without fertilizer. Where I used 'AA QUALITY' Fertilizer the roots reached greater depth in the soil and the corn was better able to withstand the exceptionally dry weather. The stalks kept green until maturity and the yield was 20 tons to the acre of well-matured and heavy-eared ensilage. On the unfertilized field the leaves commenced to dry up early and the crop yielded only 7 tons per acre—without ears, too. This test convinces me that 'AA QUALITY' Fertilizer will lower the cost of production by at least one-half." Ernest Havens, September 18, 1930.

\$266 Per Acre Extra on Potatoes

Increased yields obtained by using enough of the right kind of fertilizer mean increased profits for the farmer. See how "AA QUALITY" Fertilizer boosts income, even under extreme weather conditions. Mr. Charles S. Myers, of Stahlstown, Westmoreland Co., Pa., writes:

"This year, in spite of the driest weather we have ever had, we had a mighty good potato crop—265 bushels per acre—of good quality potatoes. In growing this crop, I used good seed potatoes, applied 'AA QUALITY' Fertilizer liberally, sprayed often to keep away blight, and kept the ground cultivated well to retain moisture. The average yield in this section ran around 75 bushels per acre, so I am well satisfied, and will continue to depend upon 'AA QUALITY' goods for larger yields and profits." Charles S. Myers, November 12, 1930.

Mr. Myers sold his potatoes for \$1.40 a bushel, so the 190 bushels by which his crop exceeded the local average meant \$266 extra income.

Increased Yield . . . Larger Profits

Increased yields obtained by using AGRICO and the other "AA QUALITY" Fertilizers mean reduced costs per bushel and bigger profits per acre. AGRICO is made of specially selected materials which supply not only the usual plant-food elements but extra elements which mean extra yields and bigger profits.

There is a brand of AGRICO for each crop. See the nearest "AA QUALITY" Fertilizer dealer and place your order now. Know what it costs to grow your crops. Ask your dealer for a copy of the new simplified Crop-Cost Blank. Use it and see for yourself how AGRICO reduces costs and increases net profits.

2½ TIMES THE AVERAGE YIELD: Mr. Charles S. Myers, Stahlstown, Westmoreland Co., Pa., averaged 265 bu. potatoes per acre. This was over 2½ times the average yield in his section. In the picture are Mrs. Amanda Blackburn, Mr. Myers' mother-in-law, and Mr. Charles F. Ulery, "AA QUALITY" Fertilizer Dealer. (Nov. 12, 1930.)

Jared Van Wagenen at Home

An Intimate Glimpse at the Writer of "Fireside Reflections"

EDITOR'S NOTE—The story on this page was given by County Agent Ray Pollard, as a radio talk over Station WGY. Jared Van Wagenen holds such a place in the hearts of our readers that everyone will enjoy this personal, intimate story about the home life of this farmer whose family has tilled hillside farms for over a hundred years.

LIFE and the radio are somewhat alike. If the batteries are dead, nothing comes forth. If the connections are poor, or static present, life is likely to be hum-drum and the radio drum-hum. But when the radio is properly tuned in, the sounds of music and of the voice are reproduced most faithfully. And so with life—the person who listens to the note of Nature's tuning-fork will find existence both pleasing and harmonious.

If I were to name some men today who are tuned to the music of life, I would include Jared Van Wagenen. He finds the joy of today, remembers the pleasures of yesterday and anticipates the delights of tomorrow.

A Farmer by Choice

Thousands of folks of New York State and more hundreds outside know Mr. Van Wagenen because they have heard him speak or have read what he has written. The chances are that you are one of these. But only a comparatively few of these thousands have had the privilege of knowing him at home. But this has been my opportunity for almost fifteen years. For that time my house has been within two miles of his house. My path has led me frequently to his door. So, today, I want to picture him at home.

He is a farmer by choice and inheritance. He dwells in what he is pleased to call an ancient and eminently respectable hamlet—the same

By RAY POLLARD

Schoharie County Farm Bureau Manager

being, by name, Lawyersville, situated in the good county of Schoharie. This is a very small village—I think 30 families comprise it. Yet here we find the country grocery store, the postoffice in connection therewith, the district school, a rural church with a resident pastor, and, perhaps most distinctive, a community house. In the midst of this group of farms and homes and buildings is a little park with band-stand and tennis court and grassy lawn and maple trees. Looking on the park and down the road that leads to the valley and Cobleskill is Jared Van Wagenen's home. The house stands on a slight elevation, is painted white, is of two stories, is generous in size and a bit rambling. A stone wall flanks the lawn on two sides and a purple beach tree stands sentinel near the corner. I seem to remember that there is a door on each side of the house and I know from experience that the latch-string of each is always out. As one enters by the driveway he will see on either side a stone pier. On one is carved the words "Agriculture the greatest science," and on the other "Agriculture the oldest occupation."

Established in 1800

Perhaps no country place in Schoharie County is better known than Hillside Farm. It was established in the year 1800 by Jared Goodyear, a Connecticut emigrant who, after trying the vicinity of Ithaca, returned to this limestone country that has succored him and his descendants for 130 years. This first farm consisted of 100 acres. Mr. Goodyear was an innkeeper as well as a farmer and his tavern served the travellers of the Loonenburgh turnpike.

One of Jared Goodyear's ten children, Emily, married a neighboring boy, Rynear Van Wag-

enen, and to them passed the farm ever since possessed by one of that name. The activities of the farm were quite different in the early part of the last century. The farmer then was often his own carpenter and his own mason. With the growing of hay and grain he combined lumbering and trading. Wheat was the principal cash crop and this was hauled to Albany 45 miles distant. About 1850, the farm management included the production of fat cattle which were driven to Albany or Canajohare to market. Twenty years later the sheep industry became important and as many as 250 Cotswolds were kept. Then in the year 1877 a milk route was started to cover the little village of Cobleskill and since that time dairy cattle have had special attention from Hillside Farm operators.

In time the farm, with additions to the original 100 acres, came to Jared Van Wagenen Senior, and then a few years ago to the Jared we know best. And so we have here what I am pleased to call a "century-old" farm; one that for more than 100 years has known no change of owners, no movings, no auctions. During that time the land has grown in productivity, and barns once thought ample no longer hold the grain and fodder. A new and improved order of things has come because diligent husbandmen have made the farm productive—or as Jared would say "The soil has been tickled and has laughed forth its increase."

And this is the background of the picture of Jared Van Wagenen the farmer.

Inspiration from the Hills

Now we have usually been led to believe that a farmer should stick by his bench, so to speak, guiding the plow, following the harrow, cutting

(Continued on Page 17)

Some New Wrinkles in Farm Machinery

Dealers Will Exhibit Them During Farm Equipment Week

By E. T. LEAVITT

IN 1788, Thomas Jefferson conceived the design for the modern moldboard plow and although his experimental models succeeded very well it remained for the next generation to make use of his ideas. It also took more than thirty years to develop such elemental tools as the sulky and gang plows, the first practical model of sulky plow being brought out in 1864.

Progress takes place at a speedier rate today and instead of changes taking place from decade to decade, distinct improvements are noted from year to year in nearly every line of tools in the farm equipment industry. New models are being designed, not only to save expense and dispense with drudgery and labor, but also to enable the farmer to do a better quality of work, and through increasing his capacity, help to place his returns on a par with that of men in other industries.

Since the tractor first pointed the way toward placing at the disposal of the farmer relatively large units of power, a great deal of attention has been given by engineers to refinement of design which would give more power with less weight and to greater usefulness

through adaptation to new jobs. The experienced tractor operator recognizes these modifications, which include accessibility of parts for lubrication and adjustment, additional protection of magnetos and ignition accessories, fuel filters, air cleaners and increasing capacity of cooling system which the casual observer does not usually see. Unless fully informed, one is not apt to appreciate the increased use of anti-friction bearings, special heat treated metals and the precision of manufacture which permits the tractor to be broken in on jobs that require their utmost capacity for long hours at a stretch.

During the past year some new models of tractors have been brought out, most of these showing changes only in modification of design. Several makes will be seen during Farm Equipment Week, February 16-21, with new features such as adjustable wheel widths, increase in number of cylinders, power lift for attachments and change in drive. Another feature which is being built into tractors and their equip-

A full close-up view of the rotolactor on the Walker-Gordon Farm, Plainsboro, New Jersey. This is one of the newest developments in the machine milking of cows.

One of the new developments in disease and insect control on fruit trees, is a machine which uses a blast of air to break up a liquid spray into a fine mist.

ment is that of more simple attachment and detachment of tools. Cultivating units and special weeders are now designed and adapted for both general purpose and track type tractors.

Tillage tools, generally, are being made of heavier construction, coincident with the tendency toward using tractors of greater power, to save costs in seedbed preparation. A trend toward adding another plow-bottom is noticed and an effort has been made to combine operations, either with a hook-up of tools, or with one implement which does two or more jobs at once in preparing the soil to receive the seed.

Other developments in the combine field include machines with narrow cut, operating

Thought for the Week

WITH malice toward none; with charity for all; with firmness in the right, as God gives us to see the right, let us strive on to finish the work we are in; to bind up the nation's wounds, to care for him who shall have borne the battle, and for his widow and his orphan—to do all which may achieve and cherish a just and lasting peace among ourselves and with all nations.—LINCOLN.

Why Should Farmers Stand All the Loss?

"Why should the farmers take all of the cut in the price of milk with the dealers absorbing none of the reduction? I know of a dealer who cut his retail price of milk from sixteen to fifteen cents per quart and notified his producers a few days later that since milk had been lowered to the consumer, a cut of one cent was necessary to the farmer."

THIS question from a dairyman was reported by Amos Kirby, our New Jersey Editor, in our New Jersey edition on February 7th. The dairyman voices a just complaint of practically all milk producers. Why should the farmer always have to hold the bag? We believe it is a fair question.

It is true that many milk dealers fail and that the profits of the big companies are the result of doing a large business in handling a heavy volume rather than because the profit is very great on a single quart. Nevertheless, the great milk companies have been making real dividends for years. Few farmers have. The dealers are in a better position, therefore, to share these reductions than the farmers are to stand the whole burden.

We hear talk of better cooperation between milk dealers and farmers than there was years ago. We think there is. Now is the time, however, to prove it. We hope it is not going to be necessary to reduce milk prices further, but if it does become necessary we suggest to dealers that they do their part, and to farmers that they stand on their rights.

More Cows—Fewer Calves

FIGURES just released by the New York State Department of Agriculture and Markets show that on January 1, New York State dairymen owned about 3 per cent more dairy cows and heifers over two years old than they did a year ago. Dairymen throughout the entire country increased the number of dairy cows 2.4 per cent over figures on January 1, 1930. We are hearing a lot about milk surpluses caused in part by this

increase in the number of cows, but more particularly by decreased demand due to lack of buying power. Now is the time to sell poor producers to the butcher.

There is a ray of sunshine in the situation. The same report shows that New York State dairymen are raising 14 per cent fewer calves than they did in the spring of 1930. The average producing life of a cow is about five years so there may soon be fewer cows.

New York State on January 1, had 363,000 horses, as compared with 374,000 a year ago. There are 195,000 hogs, as compared with 233,000 a year ago, and 433,000 sheep, as compared with 461,000 last year.

The most startling thing about these figures is not the changes in numbers, but the decrease in value. Based on the estimated market value, New York State cattle, horses, mules, sheep, and swine were worth \$187,584,000 on January 1, as compared to \$249,908,000 on January 1, 1930, a decrease of 25 per cent in one year. Fortunately this is largely a paper loss because most of the animals will not be sold, at least not now.

Many economists are predicting that we are now at the bottom of the cycle and that things from now on are bound to improve.—H. L. C.

Only a Few Untested Herds Left in Western New York

IT is interesting and gratifying to know that since April, 1921, when the Township Area Method of testing cattle for tuberculosis was started, all but a few of the cows have been tuberculin tested one or more times in the nineteen counties in the western part of New York State. Here is an area covering nearly 13,000 square miles of territory. In it there are 64,182 herds of dairy cattle representing 581,423 cattle. Of this great number, there now remain untested only 461 herds, to make this great area absolutely clean from T. B.

Of these 461 dairymen in western New York who have not yet tested, there are probably very few who are actually opposed to the testing work. As a matter of fact, opposition on the part of all dairymen has largely died out in New York State as the advantages of the test have become known and as they have realized that the state pays very well for condemned cattle. These few men simply have not had time to get around to have the testing done. They have put it off just like the rest of us put off things from day to day that need to be done.

However, we make the suggestion that these dairymen will be rendering a great service to their community and to the whole dairy industry by making the test in this great area in western New York absolutely 100 per cent. A little co-operation on their part will now be greatly appreciated by their fellow dairymen. Moreover, these cattle owners may have their herds tuberculin tested quite promptly by getting in touch with the state, federal or county veterinarian in their county, or with their county agricultural agent. Why not think this matter over and help to make western New York completely free from bovine tuberculosis?

Threaten Increase in Commission Rates

REPORTS from the convention of commission merchants, recently held in Philadelphia, indicate that buyers of fruit and vegetables may increase commission charges from 10 per cent to 15 per cent. In view of lower prices, which mean that they must handle a larger volume for the same return, and because they fear that the new Federal Agricultural Commodities Act is going to require them to keep better books, it was generally claimed that they cannot make ends meet on a commission of 10 per cent.

There is doubtless something to be said for the commission man, but what about the man who grows the stuff? He gets about half as much for it, yet he is likely to be faced with a 50 per cent increase in his commission fee. A dealer may

get more revenue by raising his rates, but how is the producer going to increase his income?

The discussion at the convention also indicated that there will be much less than the usual amount of grower-financing; that is, loans made by commission men to producers mainly for the purpose of insuring that the producer will market through the man who loans him the money. Frequently in the past, growers have been financially unable to repay these loans and commission men have lost heavily. Dealers now indicate that fruit and vegetable growers will have to depend on their local banks or some other source for their financing.—H. L. C.

What Nonsense!

IT is good to see some signs of common sense beginning to percolate into the departments at Washington in the matter of appropriations for reclamation projects. The Bureau of Reclamation this year asked for an extra appropriation of five million dollars to carry on new projects in the West. This extra appropriation was refused and the Bureau was told that it must do the best it can with its regular appropriations. Possibly the protests that have come from thousands of farmers and their organizations and farm papers are beginning to have some effect, but it is only a beginning for the work will continue, perhaps on a somewhat smaller scale.

What a nonsensical situation—all of the markets flooded with surplus products and millions being spent for so-called farm relief, with other millions used by another department of the Government to bring more land into production adding more to the surplus!

A Consumer's Experience in Buying Apples

COMING, as we do, from upstate New York, we prefer certain varieties of apples. We find, however, that the metropolitan grocer-man who knows varieties is very exceptional. The first question we are asked when we want apples is whether we want cooking or eating apples. If we wish cooking apples we have a choice between "green" or "red" apples. The possible exception to this is that McIntosh are quite often sold by name because of their great popularity.

The interesting point is that eating apples are usually Western boxed apples which sell for a nickel apiece and sometimes more. Each one is polished and wrapped in tissue paper and they certainly are attractive. Cooking apples are usually New York State apples either in bushel baskets or barrels. When they are graded properly, they look good, but it is very seldom that even the best of them attract the attention that the Western apples do.

The logical conclusion to the consumer who does not know any better, is that New York State apples are good only for cooking. The more or less standard price for cooking apples is three pounds for twenty-five cents.

We noticed the same situation among the unemployed who are selling apples on New York City streets. The apples they are selling are almost invariably Western boxed apples. We were pleased recently to see one man near the Pennsylvania Station who was selling apples, labeled "New York State McIntosh". This should help to convince the city consumer that New York State apples are good to eat.—H. L. C.

Eastman's Chestnut

IT happened that two men bearing the same name, one a clergyman the other a business man, lived in the same city. The clergyman died, and about the same time his neighbor went on a trip to southern California.

When the business man arrived there he sent his wife a telegram informing her of his safe journey; but unfortunately it was delivered to the widow of the late preacher. What was the distress of the good woman to read: "Arrived safely—but heat terrific!"

A.A. Readers Define Happiness

They Send Favorite Recipes for Achieving That Blessed State

First Prize Letter

I THINK my recipe for happiness might well be called "poor man's cake", for it calls for no ingredient that the poorest and most friendless dweller in the country cannot have.

Take equal parts of book lore and natural beauty, stir with the spoon of vigorous thought and bake in the oven of a busy life.

The easy way to explain my recipe is to illustrate from my own life. All about me, since I live in the country, is wonderful natural beauty, but I enjoy it just twice as much because I see it not only through my own eyes but through the eyes of the authors, whose books I have read, the painters whose pictures I have seen, the musicians whose music I have heard.

I find happy moments in very simple things, the sight of a mossy mound starred with fragrant arbutus, the velvety touch of a horse's friendly muzzle, the song of a gay little bob-o-link as he tilts on a trembling weed.

I find there is music, too, in very queer places. Did you ever catch the song of the cutter bar as the mowing machine works through the grass, or listen for the rhythm as the ensilage cutter hurls the corn into the silo?

Alfred Noyes, the poet, taught me to hear the song in the "clippety clomp-clippety clomp" of a galloping horse's feet. There is the music of a thousand orchestras in the wind and thunder of a summer storm, the beauty of a great painter's etching in the gray and white of the woods above new fallen snow.

As for the bodily thrills, one doesn't need much money for a gallop across the fields on horseback, a swim in the quiet river, or the blood warming pleasures of winter sports.

I know of no pleasanter way to pass a long evening than in reading, and the nice thing about it is that the pleasure carries on. One doesn't notice the drudgery of dish-washing if their ears are really listening still to the poetry of Shakespeare or their mind still chuckling with Dickens or Mark Twain.

Use eyes, ears and brain if you would be happy.—C. G. HULL.

EDITOR'S NOTE—Mr. Hull's letter failed to give his address. Will he please send it to us so we will be able to forward his prize check.

Happiness On a Farm

Second Prize Letter

I AM happy because I like my job. My job is farming. I have a thorough respect for it acquired from fifteen years of experience—not so long—but ample time in which to learn that it is a job that requires the best you've got. No longer is farming a job for the fellow who can do nothing else. The cows and even the pigs and chickens are on to the new rackets and demand their full quota of violet rays, vitamins, inoculations, sanitary regulations, and floor space. The fellow who makes good on a farm today must be on his toes. Brawn? Yes. A fine thing to have. Brains? The more the better. Training? Surely, it is a short cut across lots instead of the old rocky road of climbing fool's hill by yourself. Education and intelligence? Yes. It will give you the right slant on your problems and the courage and patience to solve them.

I believe in the future of my job. Whatever of the above qualities I possess I will have a chance to use every day of my life. Modern business with its competition has hit the farmer also. If you like a fight right to the blood here's your chance—throw back your head and go to it. You'll find other fellows in the field just as smart or smarter to match wits with.

Where is there a better chance to keep the family living along with you? I can pal around with Sonny when I'm teaching him to do his share of the chores. The three kids, the oldest of which is fifteen, are at home evenings

by choice. "Gee, I don't want to go to town", says Louis, the oldest on Saturday night. "There is more going on right here at home". It may be a corn popping fest, a candy pull or dancing to the radio with a gang of the neighbor's kids or learning a few new wrestling holds from Dad on the lawn and giving him a good hot tussle. They have danced the varnish off the floor

found it—out where the man whistles at his work and the woman sings over her dishpan—"Out on the Farm".

I've found it in the greatest career in the world, that of a farm wife and mother. I've found it in the miracle of tender growing things, in the rustle of the corn, the beauty of opening buds and the love in a baby's eyes.

Oh, yes, life has brought dissap-

work, a little fun, and lo!—your happiness is won.—MRS. CHESTER H. FOOTE, Fort Edward, N. Y.

Jim's Recipe for Happiness

M EBBE y' knowd Jim. No? If y' did y'd never fergit him. Not much fer looks but good clear through, 'n allus seein' good in others, too. Seems jest as if he allus knowd jest what ter say, 'n when ter say it,—'n when ter keep still. Rich 'n poor liked Jim, though he want what y' might've called a financial success. He'd give away his last shirt er cracker if some one else was needier 'n he. 'N he'd allus do it in that winnin' way o' his'n.

He was welcome everywhere. Amiable, symphathetic, trusty. Why, the children jest idolized Jim. Pockets full o' candy 'n trinkets; head full o' stories 'n songs. He could spin 'em the most exciting yarns 'n twas interestin', too, ter hear him tell about the habits o' animals 'n birds 'n flowers.

Acted jest as though Life was one big Game that had ter be played accordin' to certain rules o' conduct,—one's good qualities versus his bad ones, as y' might say. 'N if Jim had a creed, it must've been "Rememberin' others; fergittin' Jim". Jest delighted in playin' the good Samaritan 'n scatterin' good-will 'n cheer wherever he went.

It's hard to tell a stranger jest how happy Jim made us all feel with his kindly, neighborly ways. O' course, he want no saint. But he'd a way o' hidin' his faults along with his troubles 'n his bodily ailments. Said there was enough distress in the world without unloadin' his cargo.

Then, one day, Jim died. The whole community, even to the last horse 'n dog, mourned Jim. Seemed as if the joy went right out o' livin'. Then 'twas that we began ter try Jim's recipe for happiness. 'N, mister, it did us heaps o' good,—just tryin' ter be like Jim.—FLORA WEBSTER, Genesee, Pa.

Spelling It Out

H—Health—Without this it is very difficult to be happy.

A—Ability—We must have ability to accomplish things for others as well as ourselves.

P—Patience—Peace—We must have patience with others which will help us to be at peace with all.

P—Pardon—All must be willing to pardon those who wrong us.

I—Interest—Interest in those around us who need to have happiness shared with them.

N—Need—We need a certain amount of this to make us appreciate what we have.

E—Enthusiasm—There is a need for enthusiasm for our friends.

S—Selfishness—This must be avoided.

S—Sacrifice—We must be willing to do this whenever we are called upon.

These ten ingredients I consider very necessary to make happiness and I hope they will be a help to someone. I hope you will find room in your paper to publish it.

—MRS. SHELDON B. HOYT, Walton, New York.

A Little Child Shall Lead Them

I am nine years of age. I think the best way to be happy is to help your Mother and take care of little Sister. And keep busy at your work. Try to make everybody else happy and be sure to read American Agriculturist.—CATHERINE CLINK, Montrose, Pa.

The Shortest Recipe

Live so you can reflect without remorse.—DAVID HATLEE, Mechanicville, New York.

Recipes for Happiness

ALTHOUGH few of us realize it, the fundamental goal which we are all seeking, the "pot of gold at the end of the rainbow," is happiness. Our forefathers well knew that this was so and expressed it in the Declaration of Independence, when they wrote that the three fundamental aims of life are "life, liberty, and the pursuit of happiness." No matter what we are doing, no matter who we are, consciously or unconsciously we are just trying to be happy and to bring happiness to those around us.

With this thought in mind, we suggested a while ago that our readers send in their recipes for happiness. Not in many years has it been our privilege to read such helpful and inspiring letters as came as a result of this suggestion. Hundreds of well-written letters were received; we can print only a few of them. There were many others equally as good, and we want to take this opportunity of expressing our appreciation to all those who wrote us and for the privilege of reading your letters.

The letters of the winners are printed on this page.

and have scratched the furniture some, but they're having a good time right here with us.

So—I've got a good job; I'm giving it the best I have; and, have a fine family coming along with me all the way. Isn't that enough to make a man smile?—FRED E. CHURCH, Hermon, New York.

"The Greatest Career"

H APPINESS can grow most anywhere but God made it grow more abundantly out where mother nature's children play.

It's catchin' too out where the skies are bluest, friends are real, and mates are truest,—out where the children romp and flowers bloom, just because they're glad—out where the rooster crows, the cricket chirps and the birds proclaim from the treetops that they've

pointments but they've only been God's blessings in disguise. Above my door of happiness, I've engraved these simple words, "Keep Smilin' and Keep Goin'".

Do you want my happiness recipe? I'll guarantee it to fill a number of hearts, medium, large or small, to be good for life, grow mellow with age and keep indefinitely. Have you paper and pencil handy? Here it is.

"My Happiness Recipe"

To the music of a song add: A generous helpin' of love, alternately with an equal amount of faith and trust. Season with the spice of laughter, a drop of kindness, a speck of humor, an ounce of contentment and two of thankfulness. Add a dash of imagination and a whiff of God's out-of-doors. Flavor with appreciation. Stir with understanding and blend with tact. Decorate with a hobby or two, a lot of

A Mechanical Judge

IN Times Square, New York, is a mechanical bogus-coin detector. Mag-

By DR. J. W. HOLLAND

The A. A. Philosopher

nets are adjusted in such a way that when coins are dropped into the slot, the bad ones are deflected from the ordinary channel. Then a loud mechanical robot voice shouts, "PLEASE USE GOOD COINS ONLY." Needless to say, no person drops bad coins into the slot but once.

God made the heart of men with a similar device. At its creation each human soul has in it a conduct detector. A king grew covetous of his neighbor's vegetable garden. A trumped up charge against Noboth secured his stoning to death and Ahab took possession of the garden. Elijah became the voice of vengeance upon the wicked king. "Hast thou found me, O mine enemy?" cried out the king. He had tried to pass bogus conduct in a righteous universe. It can't be done.

This Voice within us has an approving tone as well as a disapproving note. I do not know of any pleasure comparable to the feeling that one has done, in any given situation, the right thing. In my earliest boyhood, I once took a small piece of money that did not be-

long to me. My conscience detected the fault and shouted loudly to me. I remember with what carefulness I slipped into the parlor and put that nickel back where it belonged. I can recall, even now, how bright and warm the sunshine felt as I ran out happy hearted to my play. I am absolutely convinced that happiness depends upon "good conscience."

We are building in America the vastest system of material things that has ever been built by man. Things crowd upon us until we are likely to believe that they are the most important factors. They are not. The most important thing about a human being is his Soul. The most important thing about the soul is obedience to God and Conscience.

The description of this mechanical coin-tester says that its parts must be delicately adjusted and that it easily gets out of repair. It is so with Conscience. It must be listened to and obeyed, or it finally cannot be heard.

When I went to college I had an alarm clock. At first it almost scared me into wide-awakeness. One morning I turned it off and turned over and went to sleep. I did this for several mornings and finally I could not hear it at all. Then I had to resort to strenuous methods. I put the clock on an inverted dish pan upon my table. I heard it. By getting up promptly for a few weeks, my ears became again sensitive to its bell.

The conscience that is obeyed becomes more easily heard.

Dr. John W. Holland

Turn Idle Acres Into Profit and—

Save Time and Money On Other Disking Jobs

Turn old pasture land, hard baked bottom land, cleared wood land, drained swamps, heavy sod, etc., into big crop producing acres with the CLARK CUTAWAY Bush & Bog Plow and Harrow.

For this sturdy machine, with its extra heavy disks easily and quickly breaks up and pulverizes soil that's too tough for the average plow or harrow.

The CLARK CUTAWAY Bush & Bog Plow and Harrow is an investment that pays for itself many times over because it makes productive land out of waste land. Equipped with heat treated disks of cutlery steel forged sharp for better work and longer service. They're unconditionally guaranteed for 3 years. For all tractors, also 2 and 4 horses.

Mr. A. W. Moore of Southport, N. C., writes—

"I have been clearing new land for the past fifteen years. During that time I have used almost every kind of plow. The Bush and Bog Harrow purchased from you is the only one that was satisfactory. With a Bush and Bog Cutaway Harrow, it makes clearing new land a real pleasure."

Mail the coupon for FREE book, "The Soil and Its Tillage," and catalog fully describing the Bush & Bog Plow and Harrow and other Clark "Cutaway" farm implements.

Virus Diseases of the Raspberry

How can the raspberry diseases, commonly known as virus diseases be controlled?

THERE are several diseases collectively spoken of as virus diseases of raspberries, namely mosaic, leaf curl and streak. Authorities generally agree that these diseases are caused by a virus found within the plant which is carried from diseased plants to healthy plants by various species of plant lice. Mosaic is characterized by a yellowish mottling on the leaves and frequently also by a dwarfing of the leaves with an upward curling of the margin. Leaf curl can be recognized by a downward curling of the leaves together with a dwarfing in size. The canes are also dwarfed and very brittle.

Streak can be recognized from the leaves, which become very dark green and curl downward so that the undersides of the leaves are frequently facing upward. At the same time, the cane changes to a deep bluish tint with short dark reddish streaks.

We do not know of any control for these diseases and the only method to combat them is prevention. The first step necessary is to be sure you get plants which are free from disease. Because these diseases are carried by plant lice it is a good idea not to plant them closer than a thousand feet from other bramble fruit which may be infected with these diseases. It is also advisable to plant red, purple and black varieties as far apart as possible, preferably at least 100 feet. The reason for this is that certain types of mosaic may not be serious on one variety of berries but when it is spread to another variety it may become very severe.

The only way of ridding a berry patch of these virus diseases is to examine the bushes and dig out any diseased plants. They should be destroyed by burning.

Fall or Spring Planting

In setting out apple trees, which is usually advised, spring planting or fall planting?—C. D., New York.

MOST authorities seem to agree that for the northeastern section of the country the advantages of spring planting more than offset the disadvantages. One of the advantages often spoken of for fall planting is that trees get a chance to become thoroughly established in the soil. On the other hand, there is more danger from winter injury. This injury seems to be caused more by a drying out of the tree than it is by actual low temperatures. If trees are set out early in the spring while they are still dormant, they have an opportunity to get fairly established in the soil without the disadvantages of fall planting.

Controlling Fire Blight

Is there any practical method of controlling fire blight? Many of our trees were badly affected last spring, and we seem to be making no progress in stopping it.

FIRE blight is not easy to control. It has been demonstrated experimentally that it can be controlled, but if your near neighbors' trees have the disease your trouble will be greatly increased. We would advise the pruning this winter of all branches that show traces of the disease as well as the removal of all water sprouts. In the spring, branches should be removed as soon as they become infected. Infection usually occurs through the succulent tip growth. Water sprouts are particularly liable to infection and this is to be avoided because through them the disease gets into the larger branches.

When diseased branches are pruned it is important to disinfect the cut surface with corrosive sublimate 1 to 1000. If this is not done the knife is likely to infect the cut surface and allow the disease to continue as though nothing had been done. Frequent inspection and pruning is important during the growing season.

Use Only Vigorous Strawberry Plants

MANY times the strawberry bed looks so fine to the grower that he dislikes to dig up the plants for setting out the new bed. Consequently there is a tendency to take the smaller plants from the outer edges of the row. When this is done the grower is merely cheating himself.

Over in New Jersey they tried out the proposition with these results. Plants were obtained by digging up the entire matted row and then grading them into various sizes. These were set out last spring and while they have not yet fruited the difference in size and vigor is very marked; the part of the field set with the strongest plants showed much the better appearance during the summer.

A record of yields was kept in 1927 and 1928 on two farms which secured plants from three different growers. There was quite a difference in the size of the plants which reflected itself in the yield as follows:

Source of Plants	Quarts Yield 1927	Quarts Yield 1928
Grower 1.....	6,661	5,486
Grower 2.....	5,318	4,400
Grower 3.....	4,661	4,083

As a result of these trials, the New Jersey Experiment Station is recommending that the entire matted row be dug up when you are getting plants and that you discard the small and obviously weak plants before setting.

How Currants Are Propagated

I have some very good black currant bushes and wish to increase them. Is this done from the roots, slips or other cuttings? Please explain the proper time to do this and exactly how if you can.

CURRENTS can be propagated by cuttings about eight to ten inches long made in the fall from vigorous wood of the previous season's growth.

They can be stored in sand in a cool cellar or they may be buried in dry ground with the bottom end up. These are put out in the spring, three inches apart, leaving about two buds above the ground. It is also possible to make the cuttings just before they are set out in the spring.

Spray for Peach Leaf Curl

What concentration of lime sulfur should be used to control peach leaf curl. Will a concentration of 1-8 injure the trees.—T. F. D., New York.

LIME sulfur 1-8 will sometimes cause injury. A dilution of 1-15 will control leaf curl, but the spray must be applied very thoroughly during the dormant season, preferably before winter sets in. It is possible to spray for curl just before growth starts in the spring.

Certified Raspberry Plants

Is it worth a premium in price to get certified raspberry plants that have been inspected by the state?

I N New York State there is a law which requires all nursery stock to be inspected by the state before it can be sold. Therefore, there should be no sale or distribution of raspberries in New York State unless they have been inspected and certified by state inspectors.

A seventy colony apiary is equivalent to about forty acres of land in both labor and income.

FARMEX FACTS

When Charles Sprague Pearce painted the mural "Labor" for the Library of Congress in Washington, he pictured two young farmers of a bygone age clearing the land. To Mr. Pearce's mind, pulling out a stump with antique implements was labor. You'll probably agree that he was right.

FARMEX

EXPLOSIVES

This painting is fitting for the wall. For such methods today would push any farmer to the wall. The modern farmer uses Farmex Explosives to remove stumps and boulders, just as he takes advantage of modern machinery. Write for information on explosives for the farm and special booklet for ditching.

What Is Gum-Dipping?

Gum-Dipping is the Firestone trade name for that patented, basic process which makes Firestone Tires fundamentally different from all other tires. It is one of the reasons why Firestone,

through many years, has easily been able to make good the statement: "Most miles per dollar." It is not something done to a tire after it is made. It is something very vital done before the tire is made.

The Babcock Test—Sulphuric acid dissolves the non-fatty solid constituents of milk. As sulphuric acid is dropped into the milk in a test tube, the fat separates from the milk and rises to the top and shows the amount of butter fat present. Note the difference in the two samples.

Write us for U. S. Department of Agriculture information on testing milk. Firestone Tire & Rubber Company, Akron, O.

The Firestone Test—Sulphuric acid also dissolves cotton. Test tube No. 1 shows a cord taken from a used tire that has not been Gum-Dipped and it disintegrates in the acid. Test tube No. 2 shows a cord taken from a used Firestone Gum-Dipped Tire and it remains intact.

To grasp the full significance of Gum-Dipping, it is necessary to know something about how a tire is made and what goes on within a tire on the road. The body of the tire bears the principal strains in service. To it is attached the tread which provides traction and takes the wear of the road.

The usual tire body is built up of layers or plies of cotton cord between which rubber has been forced. Rubber is incompressible. Hence the tire body practically does not expand or contract to meet road shocks. It flexes—that is, it changes form.

The strain of the flexing tends to pull the plies apart and also to pull the cords themselves apart. A tire flexes about seven hundred times in a mile—which gives some idea of the strains and the friction which a tire must endure.

The great enemy to tire life is internal friction. Years ago the fabric was square-woven—and the cotton cords sawed, one across another.

If cotton rubs against cotton, the tire soon heats up and collapses. That is why the square-woven

fabric tires were so short-lived. Then came the tires with parallel cords that could not saw each other. Making the cords parallel was a great advance—but it was only part of the battle against internal friction.

It was realized that if the fibers of cotton in a cord could be insulated one from another, then a step-up in tire life could be had comparable to that made by shifting from square-woven fabric to parallel cords. That is what all tire makers have been striving for. That is what Firestone has achieved.

Every cord used in Firestone Tires has been treated with a rubber solution which penetrates every cord and coats every fiber; and thus not only the cords, but also the very fibers within them are insulated.

Eight pounds of fine, pure rubber are, by the patented Gum-Dipping process, integrated into every one hundred pounds of cotton cords. This

means three extra pounds of pure rubber added to an average set of tires—and added where it means most to the strength and the life of the tire. This extra rubber all goes into the cords of the tire—where you never see it.

Why does Firestone put in this extra value? And what does it mean to you? It means just this. The performance—the extra value—has been shown for years on the road and in the laboratory. It has been proved that Gum-Dipping:

—increases the flexing life of a cotton cord by 58%.

—increases tire life by from 25% to more than 40%, according to the severity of the service—the more severe the service, the higher the percentage.

Firestone Gum-Dipped Tires are not just tires. They are thirty years of organized experience. They are sold only through Firestone Service Dealers and Service Stores and only as Firestone Gum-Dipped Tires—bearing the Firestone name and bearing the Firestone emblem that appears on this page.

Wherever you live—city or country—a fresh and complete stock of Firestone products is near-by.

With the A. A. Vegetable and Crop Grower

A New Tomato

By PAUL WORK

A. A. Vegetable Crop Grower

THE tomato world is all agog over the Break O'Day tomato which is being offered commercially for the first time this year. This new variety was fairly widely tried out last year and promises great merit. In our Cornell

Paul Work

trial it was as early as any Earliana, although some stations found it a trifle later. The fruit is of Marglobe type, large, round, smooth, red and very attractive. The vine is more vigorous than that of Earliana, but not as vigorous as Marglobe. It represents a cross between Marglobe and Marvana. If Break O'Day turns out to be as good as it appeared last year, it will probably replace, almost entirely, the Earliana which has been a money-maker, but also a thorn in the gardener's flesh for many decades. The principal merit of Earliana is its earliness.

Originated By F. J. Pritchard

All three of the varieties mentioned above, Break O'Day, Marglobe, and Marvana were originated by Dr. F. J. Pritchard of the Bureau of Plant Industry at Washington, D. C. Dr. Pritchard died suddenly in the midst of his work on January 13th, at the age of 56. Few have had the privilege of making as distinguished contributions to the vegetable industry as Dr. Pritchard. He is best known for his work with tomatoes, having studied a number of serious disease troubles. The fusarium wilt of tomatoes does not trouble greatly in New York, but further south the fungus lurks in the soil and causes wilting and death of plants. Spraying and dusting are useless and so resort must be had to disease resistant stocks. Years ago, Dr. Pritchard found that the Marvel, a French variety, is decidedly resistant to this disease. He crossed it with Stone, producing Norton and others; with Globe, producing Marglobe, and with Earliana, producing Marvana. Marglobe, in particular, has become one of our most prominent tomatoes. More recently, he crossed Marglobe and Marvana, selecting for earliness and the new Break O'Day is the result. Dr. Pritchard was working on a number of other improved varieties and it is a tragedy that his work should be thus interrupted.

Regional Markets

The regional market issue is a vital one for vegetable growers and consumers in the state of New York. For a clear-cut presentation of the plans that have been devised over a long period of study, write to the State Department of Agriculture & Markets, Albany, N. Y. for a copy of the report of the New York State Conference of Mayors entitled, "Regional Market Needs in New York State."

Producer Versus Consumer

Under this caption there appeared an editorial in the Elmira Advertiser of January 12, 1931, commenting upon a report from the meeting of the New York State Vegetable Grower's Association at Syracuse, to the effect that growers are interested in combating the influx of produce from outside the state. The editorial raises the question as to whether the state should foster the interests of producer or consumer.

More than once, in growers meetings, proposals have been made for arbitrary restrictions of the free movement of produce from growing section to market, or from market to market. In al-

HENDERSON'S SPECIAL OFFER

IF you will send us 10 cents, and mention where you saw this advertisement, we will mail you Henderson's new catalogue, "EVERYTHING FOR THE GARDEN," and the new Henderson 25c Rebate Slip.

Every Rebate Slip Counts as Cash

HOWARD GILLET, Box 1, NEW LEBANON, N. Y.

most every instance, growers have been wise enough to see the folly of such a movement. Effort to "combat the influx of garden truck" can best take the form of better methods of production and marketing on the part of our own people, and we believe this is generally understood by thinking growers. Solving the problem this way is in the interest of the consumer as well as of the producer. The way for the grower within the state to improve his sales outlet is by offering better stuff in better shape and with better service. Competition, both within and without, will take care of the price and there is no indication at the present time that prices are likely to advance materially.

At present, the average vegetable grower cannot make a financial success of his business, provided all costs are considered. It is only the grower who produces a quality article at low cost that is really making money, and when carrots sell from the field at \$6 a ton and celery at 50 cents a crate, it is pretty difficult for even the best to break even. The consumer has not much occasion to object when 50-pound bags of onions can be bought for 60 or 65 cents. Chain stores and green groceries are doing much to reduce distribution costs.

Of course, the most urban minded editor realizes that we cannot have proper development unless each important group of our people receives fair remuneration for its contributions to the welfare of society. If New York can produce a better commodity at a lower price, let us use New York products. If it cannot, let us import from other states or countries. At the same time, let us not neglect any effort to produce our best, and if the public does not want to pay for it, we will do something else.

Storing Cut Seed Potatoes

IN sections where a few potatoes are grown as a side line, it is fairly common to cut seed and plant it the same day. However, in sections where a

heavy acreage is grown, it becomes necessary to cut some time in advance.

Under these different conditions it has been found that a cork layer forms over the cut surface, preventing evaporation of moisture and forming a protective coating to keep out decay organisms. Experience shows that this cork layer forms most rapidly when the potatoes are kept at a temperature of 70 degrees in a dark, moist place.

Where they are planted immediately after cutting the cut surface usually heals but if the weather is very hot or very cold or if the soil is very dry this healing may be slow and rot-producing organisms may gain entrance to the seed piece and prevent normal growth.

Buy Hardy Alfalfa Seed

We have read of the Ontario Variegated Alfalfa. Is this a better variety than Grimm, and how can it be recognized?

ONTARIO Variegated Alfalfa is not considered a better variety than Grimm, but ordinarily it costs less. It is imported from Canada, and the seed should be stained purple.

The United States Department of Agriculture has devised a verification system by which the dealers are permitted to advertise the state where common alfalfa was grown. This is a protection only where growers realize the states where hardy common seed are grown. For example Oregon grown alfalfa seed is not suited for New York conditions, while that grown in Idaho or Michigan has given good results.

Prepare Early for Oats Seeding

RESULTS obtained in oats seeding tests at the Ohio Experiment Station during the past seven years are clear and concise. In the first place early seeding proved its superiority over later seeding. Little difference was found in the relative yields of oats seeded at an early date on disced or plowed land, but disking sometimes has an

"edge" over plowing because the ground may be put in shape quicker with a disc.

As a seven-year average the loss in yield for each day's delay in planting after April 10 amounted to a little more than one bushel. In 1929, plowing and seeding on April 24 resulted in a crop of 52 bushels per acre. Plowing May 22 and seeding the same day produced only 22 bushels.

One practical interpretation which farmers can make of these tests, is that they must be adequately equipped to put their land in shape when a few days of bright spring weather permits.

—Robert A. Jones.

Seed Treatment for Rhizoctonia

Can you tell us what is the matter with our potatoes and how to treat them? We didn't have a very large crop of potatoes last fall. The vines grew large and the joints looked just as if they had little green potatoes on them. I don't think they had too much fertilizer. There just seems to be a few small potatoes in a hill. Do you think this is a disease that we could prevent by treating the seed before we planted it?—Mrs. A. M. R., New York.

YOUR potatoes last year were troubled with a disease called rhizoctonia. This is a fungus which attacks the plant near the surface of the ground and blocks up the tubes which carry the starch from the leaves to the roots. This starch, of course, is made in the leaves and inasmuch as it cannot get to the root, it is stored in the stems in the form of thickened stems and little tubers usually located at the joints.

Consequently, a plant with this disease looks unusually healthy until dug when there are either no potatoes or else a very large number of small potatoes which have no market value. The usual seed treatment with corrosive sublimate or some of the newer dust treatments will control this disease if at the same time the crop is rotated so that the ground is not too badly infected.

Good Clover Means Good Grazing

CLOVER cannot grow luxuriantly without plenty of potash. The pasture above was liberally fertilized with lime and phosphorous. Note the absence of clover, at left, where this was the only treatment. Where plenty of potash was added, at right, clover thrived.

Clover furnishes your herd with feed rich in minerals and protein and gives new life to your sod. Dairymen from Maine to Maryland have found that a good pasture fertilizer like a good potato fertilizer must contain plenty of potash.

Last season fertilized pasture produced good green feed two weeks before unfertilized pasture was fit to graze. This earlier grazing decreased feed costs and increased milk flow enough to pay

for the fertilizer, before unfertilized pasture was ready to graze.

Fertilized pastures kept on producing feed after the unfertilized grass was dry and brown. In 50 tests in nine northeastern states the average profit was \$29.62 above the cost of fertilizer. This profit was secured by more days of good grazing—earlier in the spring and later in dry weather.

It will pay you to give your pasture 600 pounds of well-balanced potato fertilizer per acre six weeks before you turn out your cows.

POTASH makes PASTURES PAY

*"We Guarantee
this Feed of Champions
to give you —
More Milk for
your Feed Dollar"
—says Uncle Charlie*

G. W. HACK of Connor Park Farms, Berwick, Pa., says he has tried them all and now feeds his entire herd on B-B 24% Dairy Ration. At the Columbia County Fair, Orva's Delight, shown above, walked away with Grand Champion honors. With the Guernsey competition, the stiffest in years, the Connor Park herd took six firsts, three seconds and four thirds, quite a field day for this B-B fed herd.

Gets Quick Results

Bull Brand Feeds are profitable for any dairyman. From Oakdale, Md., Oscar Martin writes that his cows gained ten gallons of milk in less than two weeks after he switched from a higher priced feed to Bull Brand. Howard Kriebel of Lansdale, Pa., says, "I've been feeding my 22 cows a brand that I thought couldn't be beat. But with B-B my cows have increased 75 pounds of milk per day and are holding it." "Two full pails more a day on B-B," writes M. B. Ryan, Bomoseen, Vt. "After changing to B-B my herd jumped 40 qts. a day," says Robert Bell of New Egypt, N. J.

Results like these are general

among the thousands of B-B users. Made on a perfectly balanced formula, from choicest protein concentrates, minerals and other necessary ingredients, B-B Feeds hold a ten-year-record for being most productive per dollar of feed cost.

Our Money Back Offer

We are so sure that you will get better results with B-B Feed that we will make you the squarest offer you ever heard of. Get from your dealer (write us if he can't supply you) enough B-B to last one or two cows for 30 days. Feed according to directions. At the end of that time compare milk production, condition of the cows and feed cost. If B-B hasn't given you most milk per dollar of feed cost take the empty bags and your figures back to your dealer and he'll return your money without question. With all their remarkable productiveness, B-B Feeds are *surprisingly low in price*. Better take steps to join the big family of B-B feeders right now.

Maritime Milling Co. Inc., Buffalo, N. Y.

B-B Guaranteed Dairy Feeds include 24%, 20%, 16% — a suitable protein content for every grade of roughage. Also a complete line of Poultry Feeds.

DAIRY RATION

More Productive—Yet Surprisingly Low In Price!

With the A. A.
DAIRYMAN

N. Y. Dairymen Awarded Honor Roll Diplomas

EACH year the National Dairy Association awards honor roll diplomas to dairymen whose herds average better than three hundred pounds of butterfat. The records on which these diplomas are based are secured from Dairy Herd Improvement Associations, commonly referred to as "Cow Testing Associations," and Herd Tests which are sponsored by most of the purebred cattle associations.

The Dairy Herd Improvement Association is a cooperative group of from twenty to thirty farmers who hire a tester who goes to each farm one day a month to weigh the production of each animal in the herd, to make a butterfat test of each animal's milk, and to figure the cost of feed during the month. A recent development has been made which might be called "central office testing" where the tester has a permanent office and the milk samples from each dairy are mailed to him once a month. This enables one tester to handle many more herds.

The following is a partial list of dairymen in New York State, who have been awarded 1930 honor roll diplomas by the National Dairy Association:

"No, Sir! This Equipment Isn't Costing Me a Dollar!"

"HOW do I figure that out? Well, here's a few examples of what that equipment is doing for me. I could name you a hundred-and-one different things, but I'll start with those drinking bowls. Do you know, since I put them in, every cow in the herd has been giving me an average of four pounds of milk extra, a day?"

"You know, Joe this is Starline equipment, every idea is tested—worked out and proved, and patented. Here's a new discovery, a piece of equipment that I bought, that has cut my work of cleaning the cows just about in half. There it is—that little tube running across the top of the stallion. Doesn't look like much—but it absolutely prevents the cow from littering up the stall."

"Come out here in the poultry house a minute, Joe. The Starline people showed me how to remodel it. Their ideas saved me enough in feed, and by cutting down my baby-chick losses, so that in about

three months more they'll return me the total cost of the remodeling—and from then on the savings will be clear velvet.

"How did I get these ideas? Say, they didn't cost me a dime. I simply wrote to the Starline factory—Hunt-Helm-Ferris & Co., you know—for their two new books, and I got them free. Boy, it would make your eyes pop out to see some of the exclusive ideas they've got in those books. I'll tell you what you ought to do—you're going to build a new barn in a month or six weeks. You sure ought to get those books, now, before you start to do a thing. You've no idea the money and the time and the mistakes they'll save you. Their engineers work all the time on improving farm equipment—saving money and time. Just write them and tell them what you're planning. Those two books will do the rest for you, and you'll get all the help in the world from the local Starline man."

Save money when you build! Book suggested dozens of easy ways to increase efficiency and lower cost.

Find out how Star Litter Carriers bring back their own cost in a short time! Book tells how.

More pounds of milk per cow in this water bowl!

Get These Amazing Books Before You Build—Equip—Ventilate or Remodel Any Farm Building!

Don't invest a dollar in new equipment until you've seen these two amazing new Starline books. Find out how to get the building layout that costs the least, yet gives easiest, most economical operation.

Whether you plan to build or ventilate, to remodel or equip, and whether the building is a hog-house, a dairy barn, a general barn, or a poultry house, these two big books will furnish you vital information. Simply sign, check and mail the coupon now.

Some New Wrinkles in Farm Machinery

(Continued from Page 60)

from the power take-off of the tractor. Changes in standard combines have been made to add to their serviceability and also versatility in handling varied crops. Recleaners and grain weighers are being welcomed for combine use in many sections.

Grain separators have been made smoother running, requiring less power, and are easier to adjust and lubricate. Considerable progress has been made to standardize sizes so as to reduce stocks and yet offer full service to threshers. Grain cleaners, mounted on the decks of the separator have been found especially valuable in raising the quality of the grain.

Horse drawn equipment has likewise benefitted in design and use of quality materials which has characterized the whole field. Especially is this true of cultivators, both one-row and two-row which offer the operator easier control and also greater variety in attachments. Surface cultivators and sweeps have been found most effective for thistle eradication and for late cultivations, while many like the shovel types for earlier cultivations.

The trend toward legume hays is creating a demand for side-delivery rakes and hay loaders designed to save as large a per cent of the leaves as possible. Mowers with wider cut are more popular. New developments have been made in the way of a two-speed mower and also several tractor mowers. Lime sowers and manure spreaders, some of which have lime spreading attachments, are also increasingly popular.

Because of the need of additional plant food for the clover or alfalfa and also to secure a higher yield, the use of the grain fertilizer drill is increasing. Other planting machinery has likewise been improved especially in the field of fertilizer distribution as well as accuracy in planting. Truck growers will find that these improvements have also been extended to transplanters.

Two-row potato diggers are becoming common in certain areas. Some operate by the power take-off with a clutch to regulate the speed of the elevator chains. The potato sacker has

FILTERS FASTEST AND GETS ALL THE DIRT

NO WAITING—NO DELAY when you use Rapid-Flo Filter Disks

Dairymen by the thousands, in all parts of the country, were quick to see the advantages of a fast, efficient milk filter disk that would keep ahead of their milkers. That's why, since their introduction a year ago, millions upon millions of Rapid-Flo Filter Disks have been purchased by America's dairymen, and why those who use them will never go back to the tardy, unreliable disks they formerly used. In certified public tests in leading dairying communities, Rapid-Flo Disks have demonstrated their superiority to public officials and large producers. Put Rapid-Flo in your milk house, and thereby assure yourself of day-in-day-out swift, efficient filtration. Rapid-Flo is a guaranteed product of the world's largest converters of cotton for sanitary and hygienic uses.

Left—the Rapid-Flo carton of 300 disks. Right—the sanitary steel disk cabinet.

RAPID-FLO FILTER DISKS

been greatly refined the past year and will work with any standard one-row digger. Three to five men make up a standard crew.

Spraying and dusting machinery is being more widely used and, because of increasing number of applications, there is a tendency to increase the size of machine in order to do the work more quickly. In orchard work, in addition to the pressure sprayers, there is a type of machine which operates with an air blast.

The necessity of providing meal for Napoleon's army on the march to Moscow brought out the first known use of metallic disks or grinding plates. A change in market plans for many and an even greater need to provide home-grown grain for their livestock have made thousands of farmers realize the economic importance of the feed grinder for the first time during the past year. All sizes of grinders are equipped with blower fans which will carry the ground feed into bins or self-feeders. Small feed mixers are also now available for farm use which save much labor and do a more thorough job in preparing rations.

Ensilage cutters have likewise been improved in design so that they can operate at slower speeds and require less power.

New Machines More Efficient

So many farms find their incomes depend upon the efficiency of the dairy herd, that greater attention is being given to barn equipment which will also help to remove the drudgery from the daily chores. Salt and mineral cups, which are rather new devices, supply these elements as desired, resulting in increased consumption of water. These cups are used in connection with automatic drinking bowls, and attach to the stanchions within convenient reach of the cows.

In climates where the cows must be stabled a large part of the year ventilation is usually regarded as a rather serious problem. The power ventilator, which is a rather new development for dairy barns, offers positive thermostatic control which is independent of weather conditions.

The Latest in Milkers

The development of the combine milker and the more recent "rotolactor" at the Walker-Gordon farms has caught the popular imagination as to the possibilities of producing certified milk with great numbers of cows. To the dairyman with only a relatively few animals, machine milking offers the same advantage in speed, uniformity and cleanliness of product. Where the gasoline engine is used for power, it is now possible, with the heating attachment, to have hot water at hand as soon as the milking has been completed. Milking machines are now also available which provide lights for the barn so long as the motor is running. Another useful and novel device is a clipper which operates off the vacuum pipe of any standard milking machine, making it easier to keep the cows' udders and flanks clean.

While cream separators, to outside appearances, look the same as those of a few years ago, marked advances have been made in assuring easier running qualities and cleaner skimming under farm conditions.

Home conveniences such as light and water are assuming greater economic significance in connection with the production of poultry and dairy products. The high percentage of investment in farm buildings adds also to the importance of the water system and saves lights in their protection against fire. The increase in number of farm housewives who add to their income by keeping "paying guests" has also created a larger demand for water systems, farm light plants and gas plants for cooking. The newer models of farm light plants will do more than 100 jobs on the farm, all at a very low cost.

The average cow in the Massachusetts dairy herd improvement associations produces more than 300 pounds of butter fat per year or 70 pounds more than the average for the state.

MILK is made of FEED!

DROPS OF MILK are made from bits of feed. True, there is much water in a drop of milk...but the solids...the things that make it a drop of milk...are made of feed. So a difference in feeds is sure to make a difference in milk. Purina Cow Chows make such a difference because every Checkerboard bagful of it is filled with the stuff it takes to make milk.

Feed's first job inside of a cow is to keep up her body and her bones. Then, what is left of the feed is ready to be turned into milk. Purina Cow Chows are built so there's plenty left to turn into milk. Actually, there is an average of 113 quarts in every 100-pound bagful. These are figures which come from a recent national farm-to-farm survey of 18 months...a survey of 505,536 cows...a survey covering 48 states.

Because Purina Cow Chows are such milk-makers you will find that they will get the most out of whatever home-grown feeds you may have. Whatever your feed...whatever your feeding problem...there is a Purina Cow Chow built to help you make milk for the fewest cents per gallon. Purina Mills, 898 Checkerboard Square, Saint Louis, Missouri.

Because Purina Cow Chows are such good feeds you can make 100 pounds of milk with less feed...less money...fewer cows. That means something in these days.

Milk Prices
February Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		1.50
2A Fluid Cream	1.66	
2B Cond. Milk		
3 Soft Cheese	1.91	
3 Evap. Cond. Milk Powder		
4 Hard Cheese	1.55	1.50
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class I League price for February 1929 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Market Breaks Again

CREAMERY SALTED	Feb. 7, 1931	Jan. 30, 1931	Feb. 7, 1930
Higher than extra	27 1/2-28	29 1/2-30	36 1/2-37
Extra (92 sc.)	27	29	36
84-91 score	23 1/2-26 1/2	25	-28 1/2 35
Lower Grades	22 1/2-23	24	-24 1/2 28

The butter market suffered another relapse during the first week in February which started prices on the skids and by the middle of the week had lost fully 2c.

A number of factors were responsible for the break which came more or less unexpected to a large element in the trade. In fact, the Producers' Price Current carried a statement in its issue of January 31 to the effect that one of the largest cooperative associations has been willing to take on a sufficient quantity of surplus extras of 29c to maintain the market at that figure. Something went wrong for support was not forthcoming on Tuesday and values started downhill. The New York market responded to the sharp breakers that have occurred in the Chicago market both in spot and future values.

As the week came to a close retail rates, particularly in the chain stores were cut sharply that brought them close to the level of wholesale prices. This restored some confidence locally to the immediate position of the market. Buying for current chain store use broadened considerably with the result that a firmer tone prevailed at the close of the week.

The statistical story is a little more encouraging as we come to the close of the first week in February. On February 6, the four cities reported holdings totaling 19,537,426 pounds of butter compared to holdings on the same day a year ago totaling 22,448,953 pounds. From January 30 to February 6 holdings in the four cities were reduced 1,772,665 pounds compared with reductions during the same period a year ago of 1,763,763 pounds. It indicates that consumer buying has swung around once more to the blue side of the ledger.

Cheese Market Unchanged

STATE FLATS	Feb. 7, 1931	Jan. 30, 1931	Feb. 7, 1930
Fresh Fancy	18 -19	18 -19	18-
Fresh Average			
Held Fancy	21 1/2-22 1/2	22 1/2-22 1/2	24-26
Held Average			23-

There has been no material change in the cheese market since our last report. Trading is quiet on cured cheese although the tone is about steady. As we have reported in previous issues fresh makes continue to drag. Prices remain unchanged.

There was just a slight touch of easiness to the undertone as the market came to a close on February 7 when reports from country markets stated that prices in some cases had eased off 1/2c. This had no effect on the New York market for very little fresh cheese is arriving.

Egg Market Still in Bad Shape

NEARBY WHITE	Feb. 7, 1931	Jan. 30, 1931	Feb. 7, 1930
Hennerly	23	25	24
Selected Extras	22	-22 1/2	23 1/2-

Pewees			
NEARBY BROWN			
Hennerly	21	-24	24
Gathered	18 1/2-20 1/2	21	-23 1/2

The egg market is still a source of headaches and what-have-you. The

whole situation is little better than a Chinese puzzle. Prices have fallen in some cases to levels that even the most pessimistic never expected. In one way the low prices are working to an advantage. Receivers as well as jobbers and retailers are willing to carry more stocks on hand due to the fact that the low level of the price does not represent too much money tied up.

The storage situation has been an important factor in keeping egg prices low. Storage stocks have been liberal and they have been working out of the warehouses at an average rate of eight thousand cases a day, at prices ranging from 11c to 14c. At the same time the 1931 storage deal has started on the Pacific Coast where storage packed goods are going into the freezers at 26c. However, dealers show no inclination to store the current production of nearby white eggs and consequently these are selling at prices below the Pacific Coast whites.

On February 6, the ten cities making daily reports held approximately 4,000 cases of eggs whereas a year ago they held 92,000. From January 30 to February 6 cold storage holdings were reduced 134,000 cases whereas during the same period last year holdings were reduced 52,000 cases.

Throughout most of the heavy producing territory weather has been comparatively mild and a heavy movement of eggs has resulted. At the close of the first week in February severe storm conditions existed throughout the East and this may have a temporary effect on the market in the form of advancing prices.

Live Poultry Market Unsatisfactory

FOWLS	Feb. 7, 1931	Jan. 30, 1931	Feb. 7, 1930
Colored	20-22	-21	-27
Leghorn	17-19	18-20	23-25

DUCKS, Nearby	25-26	25-28	25-26
GESE	-19	18-20	22-25

The live poultry market as a whole, which includes both the freight and the express market, has been an unsatisfactory proposition for the first week in February, which is a repetition of the state of affairs that has been existing for some time. It is generally accepted by the trade as a whole. There is no doubt that consumption is falling behind. On the other hand, we have another factor that is also having its bearing and that is the supply. The incoming cars have just been about twice as many as the market could handle, and almost half of the excessive supply consists of fowls. It is quite evident that the low price of eggs in the West is resulting in a heavy marketing of fowls. For the week ending February 6, 233 freight cars of live poultry were available. The average tonnage of each car being in excess of 18,000 pounds.

When the market opened on Monday slaughter houses had reported fairly good conditions. It was not long however, before many began to have their doubts and by Tuesday the buoyancy had left the market entirely and reports indicated 224 cars available. From then on the situation grew steadily worse.

In the express and truck market only the very select stock has sold in a small way higher than the freight market. Leghorn fowls sold better than colored goods and worked out fairly well. Chickens and small pullets have been selling freely and Rock broilers have been holding steady, inclining slightly to an upward turn. Fancy capons and hen turkeys sell readily when available. A flood of Long Island ducks hit the market but they moved out satisfactorily.

Fruits and Vegetables
The apple market for both barrel and basket goods has been moving along moderately, although ordinary goods are not enjoying much popularity. These are in the poorer class. The select marks are beginning to show a little

more life. Fancy McIntosh are bringing up to \$2 per basket while Baldwins, Greenings, Delicious and Northern Spys bring \$1.75 for the best. Other qualities range downward as low as 50c per basket.

State cabbage is selling very slowly. Bulk stock brings from \$18 to \$20 per ton and once in a while we hear of a little shading, bringing some sales as low as \$17.

State carrots are moving along slowly at 50c to 75c a bushel depending on condition. California carrots are beginning to experience a little better demand. They are fancy.

The onion market is weak and irregular. Yellow onions from Western New York and Orange County bring from 85c to \$1 per hundred, with Reds worth 10c to 15c more. Orange County boiler whites are bringing from 50c to \$1.00 per 50 pound bag.

The demand for Maine and Long Island potatoes is very quiet. The market as a whole is weak and prices are trending lower. Maine goods per 150 pound sacks bring from \$2.75 to \$3., while Long Island in the same package are worth 25c more. Maines in bulk per 180 pounds bring \$3.25 to \$3.50 while Long Islands bring from \$3.65 to \$4.

Meats and Livestock
CATTLE—No steers nor bulls on sale. Few cows steady. Common to medium \$4.00-5.25. Low cutters and cutters \$2.00-3.50.

VEALERS—Steady. Choice \$13.00. Fed medium \$8.50.

HOGS—Steady 160-220 lbs. \$8.50-8.75.

LAMBS—Two loads good and choice New York fed Western lambs around 25c higher at \$9.75.

COUNTRY DRESSED CALVES—Receipts moderate all the week. Demand slow. Market steady in early part, weak and not cleaning up on Friday. Fresh receipts per pound: Choice 14-15c; fair to good, 12-14c small to medium 10-12c.

HOTHOUSE LAMBS: Receipts moderate all the week. Demand fair to good for fancy only. Undergrades hard sellers. Market steady. Good to fancy, each \$10.00-12.00; fair to good \$7.00-10.00; imitations, each \$3.00-6.00.

LIVE RABBITS—Receipts light during the week. Demand slow and carryovers daily. Market weak at 12-18c per pound.

Hay Market Unchanged
Receipts of hay have been moderate during the week and with fairly good demand prices have held steady. Undergrades have had slow inquiry while top grades have been meeting good demand. As usual very little top quality hay has been arriving, the bulk of the offerings being of medium and low grade in small bales. Prices on straight timothy in large bales remain from \$24 to \$28 with \$1 off for small bales. Mixtures range from \$20 to \$26 depending on size of bale and grade.

Oat straw gained a little during the week and is now selling at \$12 to \$13 with rye and wheat at \$14.

"LIVESTOCK AND POULTRY DISEASES", a book which has just come to our desk, seems to be of exceptional value to everyday farmers. The book covers the common diseases of cattle, horses, sheep, hogs and poultry and gives in a brief, understandable way, the principal facts, the symptoms and the treatment for diseases and parasites. This book is written by W. A. Billings of the University of Minnesota, and is published by the Macmillan Company, 60 Fifth Avenue, New York City and sells for \$3.50.

DOGS AND PET STOCK
Scotch Shepherd Pups BROKE COW DOGS. F.A. Sweet, Smyrna, N.Y.

PEDIGREED COLLIE PUPS FOR XMAS. Beauties—Males \$15-\$20; Females \$10. P. McCullough, Berea, Pa.

Farm News from New York

Federated Fruit and Vegetable Growers Plan Reorganization

IN 1921 the American Farm Bureau Federation sponsored a national grower-owned cooperative marketing organization called the Federal Fruit and Vegetable Growers, Inc., with headquarters in New York City. The Federated has handled over 175,000 cars of produce for growers valued at around \$90,000,000. This tonnage was secured in about twenty different states.

For several years we have heard rumors of dissatisfaction and lack of confidence on the part of growers in the management of the Federated Fruit and Vegetable Growers. This lack of confidence resulted on January 15, in the resignation of Arthur Rule, the head of the organization.

We also understand that the Federated Fruit and Vegetable Growers have been having some financial difficulties. It appears that they have done a creditable marketing job, but that they, or an affiliated company, the Federated Growers Credit Corporation, have found it impossible to effect collections from growers to whom they have advanced production credit to the amount of about \$2,000,000. This undoubtedly is due in a large measure to a serious drop in prices of fruits and vegetables.

Growers Confer With Farm Board

There is a move on foot to reorganize the concern or perhaps we should say, to organize a new company by enlisting the support of the Federal Farm Board and by taking what is the good and discarding the bad from the old company. Recently, thirty representative growers from a dozen different states met to talk over the situation and intend to present a rather definite plan for organizing to the Federal Farm Board. It is believed that these men speak for growers producing from twenty to twenty-five thousand cars of produce. Fruit and vegetables with an annual value of over one and a half billion dollars, is the largest commodity group in American Agriculture, the products exceeding the annual value of wheat by \$73,000,000 and cotton by \$338,000,000. It is pointed out that the fruit and vegetable industry, exclusive of citrus fruits and grapes, have secured

little recognition from the Farm Board. In fact, it is understood that only \$69,000 has actually been advanced to this group, as compared to the millions advanced for growers of other farm crops.

There has been some discussion as to how a national marketing organization for fruits and vegetables should be created, particularly as to whether the national should be established first so that local and regional cooperatives could be built around it, or whether the formation of a national association should be deferred until a sufficient number of local or regional units are available. It is generally believed that there will not be many locals or regionals created until they secure assistance and have a suitable national outlet for their tonnage.

Propose Change in Commission Merchant Law

A NEW bill which will be introduced into the New York State Legislature soon is of great importance to every New York State farmer who ships produce to the metropolitan market. Briefly, it is a revision of the New York State Commission Merchants Law. At present, this provides that dealers in New York State who buy farm produce on commission, must secure a license from the State Department of Agriculture and Markets and take out a bond of three thousand dollars for the protection of shippers. In several recent cases where commission men have failed during the past few years, this bond has been insufficient to settle with shippers who were not paid. As a result, there has been some agitation to increase the bond.

Another loophole in the old law was that it applied only to dealers who bought on commission. The fellow who bought outright was not required to secure a license or take out a bond.

The two principal changes, as we see them in the proposed revision, are that the bond is placed on a sliding scale from \$5,000 to \$25,000, and that the law will apply to buyers of farm produce whether they charge commission or buy outright. The proposed law will act as a protection only to New York State shippers. It is somewhat similar to the Federal Perishable Commodities Act which went

into effect December 2. The Federal Law is designed to protect farmers who sell to dealers in other states, and the proposed law, if passed, will protect New York State farmers who ship to New York State markets.

Reforestation Progress

W. G. Howard, superintendent of lands and forests of the State Conservation Department, recently reported to Commissioner Morgenthau concerning the state forestry program, both as to what has been done and what is planned for the future. In 1930, 20 counties appropriated about \$67,500, while the state appropriated about \$49,000. 17 counties planted nearly 5,000,000 trees.

The state contracted for and acquired 45,000 acres on an average of \$3.70 an acre. The average cost to plant trees was \$7.56 an acre. 5,411 acres were reforested, the areas varying in size from 500 to 3600 acres.

A note comes from the Conservation Department to the effect that anyone who is thinking of purchasing trees from

the Conservation Department for reforestation in the spring, should get their orders in early. On January 31st there were already orders for 7,500,000 trees, an increase of half a million over the number ordered on the same date last year.

Western New York Chick Show

ON March 6th and 7th in Batavia, there will be a Western New York Farm Bureau Baby Chick Show and Convention. The show is under the auspices of the Genesee County Farm Bureau with other New York western farm bureaus, and the Poultry Department of the New York State College of Agriculture cooperating. A program may be obtained by writing to the Genesee County Farm Bureau office, Batavia, New York.

A profit of \$1073.16 was realized by nine members of the Warner 4-H sow litter club during the past year, according to a report by Clarence Nelson, local leader.

G.L.F. Stockholders Elect New Directors

THREE new directors were elected at the annual meeting of the Cooperative Grange League Federation Exchange, Inc., held at Olean, N. Y. on Feb. 2nd. The three directors are Fred L. Utter of Friendship, N. Y. who was nominated by the Dairymen's League Cooperative Assn., and elected to succeed himself, Frank M. Smith of Springfield Center, N. Y. who was nominated by the Farm Bureau, and Edson J. Walrath of Evans Mills, N. Y. who succeeds himself and is the nominee of the Grange. These directors were all elected for terms of three years.

Speaking before more than three hundred stockholders and patrons Commissioner M. C. Burritt of the Public Service Commission stated that farmers in this territory were to be congratulated on making it outstandingly the best section of the Union to live and farm in and brought out the fact that this success was being achieved largely through the intelligent development and use of cooperatives. The G.L.F., he declared is an excellent example of a farmers' cooperative organization set up with adequate reserves, competent personnel, and a sound financial structure.

Advocates Long Time Program

H. E. Babcock, General Manager of the Exchange voiced a plea for a long time program of cooperative buying and selling, which as he expressed it, would protect the natural advantages already enjoyed by the New York Milk Shed producers.

These points were strengthened by the Treasurer's report given by E. J. Walrath, who said that the business year ending June 30 had been a banner year in the history of the cooperative from the standpoint of service to farmers. The loyalty of farmers to their organization was brought out by E. V. Underwood in his report for the Cooperative G.L.F. Holding Corporation in which he stated that farmers had purchased preferred stock liberally this past year in spite of financial distress.

Referring to the experience of the G. L. F., H. E. Babcock stated that it had taken ten years to finance, equip, and man the organization for the wholesale purchasing of farm supplies and he predicted that it would take another ten years to match the wholesale service already developed, with an efficient system of retail service agencies at the rural shipping points. Furthermore he added that the best guarantee of their value could be determined by the fact that it would take ten years to develop them.

Selling Based on Quality

Time is also needed he declared to work out sound merchandising policies. Particularly is this true in the case of the things which the farmers have to sell cooperatively. Generally speaking, any selling program for farmers' produce

must be based upon a productive program, except milk which is ably marketed by the Dairymen's League Cooperative Assn. With this one exception there is no other agricultural product in the New York Milk Shed of which there are large quantities of high quality stuff produced. This situation is being prolonged by the present system of payment for most New York State farm produce which actually puts a premium on low grade produce.

Given time, he concluded, this situation can be overcome. It is for this reason, he said that the G.L.F. believes that its proposed system of farm service agencies which combines the three functions of giving retail service on incoming farm supplies, furnishing farmers with working capital credit, and grading and shipping produce, stands the best chance of any plan yet proposed of ultimately grading New York State produce.

Treasurer's Report

In spite of continuous declines in values according to Treasurer Walrath the volume of wholesale purchases of \$29,940,516.67 for the year ending June 30, 1930 represented about 20 per cent increase in value over the previous year. The average cost of operation he said for all of the Farm Service Agencies was approximately 5% or about one half of the average cost of operation of retail feed stores in New York State. He predicted that it would take from 300 to 400 such agencies to adequately serve the farmers in the territory and said the speed at which these were developed would be largely determined by the loyalty of patrons and their willingness to provide necessary capital.

Necessary working capital is made available said E. V. Underwood, Secretary, through the newly organized Cooperative G.L.F. Holding corporation which has a preferred stock authorization of \$5,000,000. This subsidiary was formerly called the Producers' Warehouse and Elevator Company and while it furnished working capital for the G.L.F. and its Retail Service Agencies, it has an added responsibility in providing physical facilities necessary for the efficient operation of the G.L.F. With the completion of the feed mill in Buffalo last spring, the facilities for the wholesale handling of feed, seed, and fertilizer are adequately taken care of. The progress of the Exchange he concluded will be influenced by the available working capital, a fair share of which should necessarily be furnished by those who directly use the organization.

The other members of the G.L.F. Board of Directors are Fred L. Porter, Crown Point, Leigh G. Kirkland, Randolph, N. Y., Harry Bull, Campbell Hall, N. Y., Henry Burden, Cazenovia, N. Y., George A. Kirkland, DeWittville, N. Y., and Raymond C. Hitchings, Syracuse, N. Y.

New York County Notes

ERIE COUNTY—The first quarterly meeting of the Wyoming County Board of Junior Extension was held in Warsaw, January 23rd. The Steuben-Allegany Ayrshire Club held its annual meeting January 21, and elected F. Alvord of Friendship, president; C. T. Conklin of Brandon, Vermont, Secretary of the National Ayrshire Breeders Association delivered an address.

Western New York sent 176 delegates to the State Grange in Olean the first week of February. The Agricultural report from the Ten Broeck Academy, Franklinville, shows success of its system of long time home projects carried on by boys in their home farms.

The Erie County Conservation Society is spreading feed for pheasants in various sections of western New York. January weather was favorable for putting up ice. Prices of all farm produce are very low and business of all kinds is very dull. Large white hennery eggs are selling on the Buffalo market at 22 and 23c the last of January.

GENESEE COUNTY—Snow plows are kept busy. We are getting plenty of snow which will help the wheat fields. A great many farmers will face a crisis this spring. No other work is available yet and no means to continue farming. It is true that everything is cheaper but it all begins at the farmers end of the line. A farmer that had to pay good prices before the sudden drop is out of luck now. Some who were always able to meet their taxes found it hard this year. Mr. John Walker, who recently resigned his position as Genesee County 4-H Club agent is to take a similar position in Erie County. He gave a talk on "4-H Work in Western New York" over the

radio station WBEN, Buffalo, January 29th.—R. E. G.

DUTCHESS COUNTY—We are having a very nice winter here. Some snow drifts. Pleasant Valley Grange put through 10 candidates for first and second degree. On February 10th they will be put through. No market for butter or eggs. Western butter has killed the market here. New York buyers are buying homes and farms here. All are willing to do so because it is a good place to live; lots of fruit, peaches, apples, and fishing.—P. S.

CHAUTAUQUA COUNTY—Butter is selling for 40c per lb., eggs 25c a dozen, poultry 23c a lb., beef 10 to 12c a lb., hay \$20 a ton. We have been having a very nice winter although most are feeling the hard times. Money is scarce. It is real discouraging to farmers this spring. Many are leaving their farms to work for other people. Women do inside work and men outside work.—MRS. C. L. B.

ORANGE COUNTY—It would seem that we are going to have bigger and better granges in Orange County. On January 24th the Grange Masters and Lecturers met in the court house in Goshen to discuss means for better meetings. There were 24 present with the meeting in charge of President Scott King. The Farm Bureau members of Orange and Sullivan Counties had a treat in the way of a bus to the Walker Gordon Farm on February 26th. Egg prices took still another drop this week, selling now at 20 to 22c a dozen. This is the lowest price quoted on eggs for this section in some time. Other produce prices are fairly stable. Butter is selling at 35c a pound, cheese 32c, potatoes \$1.50 a bushel.—R. F. H.

LET ME HELP YOU SUCCEED WITH CHICKENS

I started raising chickens when 12 years old, and am still at it. I have condensed the results of my experience into this book which I will gladly send free on request. It tells how to raise chicks successfully.

Learn how to brood chicks correctly, and success will follow, as surely as day follows night.

Write for my free book today.

C. V. HILL, Prop. UNITED BROODER CO.
310 Pennington Ave. Trenton, N. J.

With the A. A. POULTRY FARMER

When You Buy Chicks

DURING the next few months New York State farmers will be spending approximately five million dollars for thirty-five million baby chicks to maintain their poultry flocks. The best estimate we can find indicates that about one-half of these chicks will be hatched in New York State and about one-half will be bought from outside the State.

Right now, however, the point we are most interested in is to give a few suggestions that may help our readers get their money's worth when they spend their share of this five million dollars. The first question that might logically come up when you begin to consider where to buy your chicks is a question of how much you shall pay for them. Chicks are advertised at rather widely different prices and, in general, you can expect to get about what you pay for. Of course, as the season progresses prices drop. That is, hatcheries usually charge less for June chicks than those hatched earlier. Aside from this, however, certain poultry breeders have built up high producing flocks at considerable cost to themselves and because of this they are able to get higher than average prices for their chicks. Assuming that you know what you are buying, high quality chicks are likely to be worth what they cost. After all, five cents more for a chick is not so much if, without any better care or feed, each hen will lay a dozen or two more eggs because of inherited ability.

Health Is Important

Another thing which adds to the cost of chicks is freedom from disease. There is a lot of discussion about chicks from breeding stock tested for bacillary white diarrhea. Some will say that it is all bunk and that they would not pay any more for such a chick than they would for ordinary stock. Bacillary white diarrhea can be inherited by chicks, but this is not the only way they can get the disease. It may be contracted after the chicks are hatched. Assuming that the chicks are kept under sanitary conditions, we believe that chicks from bacillary white diarrhea tested flocks are likely to suffer less losses than those not from such flocks. Unless you are going to raise them under such sanitary conditions, it may be a waste of money to buy them.

We frequently get letters from readers who have bought chicks advertised to be from flocks free from bacillary white diarrhea. Often they have sent chickens to a State Veterinary College and the report comes back "positive," indicating that the chicks have this disease. As we understand it, this is not positive proof that the parent stock had the disease because it is possible to contract the trouble after the chicks are hatched. If the hatchery can show a certificate indicating that the flock which produced the eggs had been regularly tested for bacillary white diarrhea and the reactors removed, they can advertise chicks from stock free from this disease.

Delays in Filling Orders

One of the most prolific sources of complaints handled by the A. A. Service Bureau is failure to receive chicks promptly. Chicks are not like dry goods; a hatcheryman cannot go to a shelf, pick off the chicks, and fill an unlimited number of orders. He had to figure ahead on his probable demand and try to meet it as closely as he can. As a result, he fills them in the same order they were received. Sometimes his hatches turn out poorer than he expected and he finds that he is unable to fill orders until several weeks after the poultryman wants the chicks. The best thing you can do to get them when you want them is to file your order early, specifying the date on which you would like delivery. If your order is first you are likely to get your chicks first. You cannot expect to order the

Jared VanWagenen at Home

(Continued from Page 3)

his grass, wielding his axe, and milking his cows. Public speaking should be done by preachers and lawyers, and writing by poets, and historians and novelists. But now I ask you why may not a farmer excel in writing and speaking when we consider that he lives in the country whence comes the chief inspiration to speak and write.

In the south-east corner of Mr. Van Wagenen's home is the sitting room, equipped with a fireplace, and on the walls some pictures painted by his mother who was a student in the Carlisle Seminary in the fifties of the century past. This room is his office and here he writes the many articles that appear in American Agriculturist; here are brought into being the talks that he is giving over WGY. He has one book to his credit. It is entitled "The Cow"—a delightful story of the foster mother of the world and of the country which he call the Kingdom of the Cow. Then he has written a bulletin entitled "The Golden Age of Homespun"; a most charming story of spinning wheels, wooden plows, the cobbler's last, the water wheel, and the farm and home implements of 80 years ago. This is No. 203 of the New York State Dept. of Agriculture and Markets.

Mr. Van Wagenen's Family

Mr. Van Wagenen was graduated from Cornell University in the year 1891. For the 39 years since, he has maintained a fond regard for his Alma Mater and returns there as often as opportunity permits. For a time he taught at Cornell but the lure of the farm drew him back to Lawyerville. He married Magdalena Lamont, a Cobleskill girl and the daughter of a farmer. They have four children—Sarah who married E. B. Terbush who lives in Ellenville, N. Y., Loraine who is teaching at Canton, New York, Jared 3rd, who is managing the home farm, and Margaret who is a freshman in Cornell University. Speaking of his son's vocation, I have heard him say that he would ask nothing more than that this son should be a respected steward of his father's lands.

I have been over the farm with Mr. Van Wagenen many times. I have heard him tell of the days when his father had the care of the farm and he himself found life wonderfully pleasant. But let us get the description of Hillside Farm in his own words—"I am persuaded that to no one else can come so many visions as to the boy on the dairy farm. For I see an old red barn, and beyond the barn an orchard of gnarled and ancient apple trees which greatgrandfather planted when he looked out on life with sunny eyes a hundred years ago. This orchard had always blooms in May and always there were apples from August until the last hard winter fruit was gathered in.

"There were Ox apples and Peggy Sweets and Hooks and Goodyear Pippins and Long Stems, and other sorts unknown to any pomologist save the farm boy, and their flavor and their fragrance will never pass. Beyond the orchard is a lane with stone walls on either side and walnut trees and wild beasts of the forest—chipmunks and chattering red squirrels and even woodchucks seeking shelter with shrill whistles of fright. And then at the end of the lane is yet another enchanted land—a grove of pine trees which dropped down pungent scented cones and whispered and sobbed even on quiet sunny days, and which, on windy evenings, when I was late with the cows, made a great solemn sound like the sea surf trampling on the sand.

A Priceless Heritage

"Nor is this all, for beyond the pine grove are more walnut trees and great umbrella elms and maples from which to make sugar in the spring. There is a stream which is bright and clear and makes a pleasant babble in May and early June, but grows lazy and feeble as the summer wanes. If you lie prone on the little plank bridge (as I do

still) and gaze steadfastly into the pool beneath, you may see darting minnows and dace and even suckers, and these fishes years ago were the finny leviathan of the deep. Then across the brook and running up against the "mountain" to meet the woodland are fifty acres of pasture—a land of trees and rocks and little ravines and old stone walls mostly fallen down. Is it not a priceless heritage for a boy to have the privilege when the sun is low, of going through scenes like these—to climb the hill and call the cows and send them splashing through the brook and then on up through the grove and lane and orchard and to the barn, and after milking to take them back again and leave them keeping watch under the stars? On such things as these was my boyhood fed and my clear-eyed son also knew all these enchantments."

Yes, Jared Van Wagenen at home is a farmer; one who prefers overalls and work shoes to a swallow tail suit (and as a matter of fact, I have never seen him dressed in formal black). He

has affection for his land and his livestock; he loves his home because he believes the Grange teaching that "A well ordered household is essential to a happy home and without a happy home no farm is fully a success"; he is faithful to community interests; he believes in the righteousness of mankind. As a farmer at home he says "For a hundred years, and more my people have worked on this old hill farm, and have lived by it and on the whole it has answered to their care. A hundred years ago it sent a boy to college and it is sending boys and girls to college still. Of the by-gone men who tilled it, none ate the bread of idleness and none has known want. I like to remember that out of its soil for all these years has been nourished a wholesome civilization and a generous life.

Losses of seedlings on land that is not adapted to alfalfa is what makes alfalfa expensive. Be sure your land has enough lime.

Money spent for fertilizer should be considered a business investment. Like other investments it should be made wisely.

There are 200 practical applications of electricity and of General Electric equipment to farming. Consult your electric power company - - find out which of these labor-savers will bring you the greatest immediate profit

General Electric Heating Materials Prepare the Crops for Early Markets

It's the off-season market that brings the highest prices.

General Electric will help you reach that market by means of controlled electric heat, applied to sprouting benches and hotbeds. It furnishes ideal conditions for rapid, wholesome germination and growth of plants during the early season.

Electric heat employing the G-E system is dependable, uniform, inexpensive, and clean. Its automatic regulation results in care-free operation in the dairy for water heating and sterilizing; in poultry raising, for incubating, brooding, oat sprouting, and water heating; on the diversified farm, for seed germinating, pig brooding, etc.

Market gardeners and florists are also using electricity and G-E equipment for irrigation, ventilation, grading, washing, bundling, and for plant stimulation through various types of lighting. They are all profitable steps in the program of early marketing.

These are but a few of the recent contributions of electrical research to agriculture. Day after day, scientific workers are developing new, practical methods and equipment for making some farm chore less burdensome—some farm operation more profitable.

Send for our new booklet, "Electric Helpers on the Farm." Address Room 313, Building 6, General Electric Company, Schenectady, New York.

Join us in the General Electric Farm Program from WGY, Schenectady, every Monday evening at 8 o'clock (Eastern Standard) and in the General Electric Program every Saturday evening over a nation-wide N. B. C. Network

BABY CHICKS

KERR BABY CHICKS ARE BRED TO LAY

THE 3000 birds on our breeding farm are descended from hens with large official records in the egg-laying contests. Part of them are also trap-nested under the rules of the New Jersey Record of Performance. The egg-laying qualities of Kerr chicks from this ancestry are firmly fixed.

In 1929-30 competitions, Kerr White Leghorns made records up to 304 eggs in 365 days. Kerr Barred Rocks, 257 eggs in 51 weeks. Kerr R. I. Reds made records up to 273 eggs in 51 weeks.

The baby chicks you buy from Kerr Chickeries carry the same blood lines as do these contest winners. BRED to lay—available from stock tested for B. W. D., which is the best insurance for livability.

last minute and get chicks just when you want them.

You can expect, we believe, if the hatchery cannot fill your order when you want it, that they will return your money if you request them to do so.

Another source of complaints comes from chicks that die after they have been received. About all you can expect from a hatchery is that they guarantee live delivery of chicks. Every year we get letters from subscribers expressing dissatisfaction with the chicks they have bought and asking us to get some refund from the hatchery. The usual complaint is that a large proportion of them have died; sometimes within a week after they were received, although it is not uncommon to get letters of complaint where chicks have died several weeks after they were received and for that matter, we sometimes get letters in the fall, complaining of chicks purchased the previous spring.

There are an almost countless number of troubles which chicks may have, ranging from simple indigestion caused by wrong feeding, over feeding, or chilling to coccidiosis and intestinal parasites. Most of these troubles are not the fault of the hatchery and we fail to see how any hatchery could guarantee that the chicks will live and expect to stay in business. At the same time, there are cases where poultrymen, thoroughly trained in their business, suffer unusual losses in the chicks they buy. Probably in most cases these chicks became chilled in some way before they were delivered to the poultryman. Here again it may not be the hatchery's fault or for that matter, it may not be anyone's fault. An unusually cold snap may have come along just at the wrong time.

Vigorous Chicks

All poultrymen know that not every batch of chicks has the same vitality. It goes back to inherited vigor, to the feed which the breeding stock receives, and possibly to the care of the eggs previous to the time they are incubated. The chick buyer should not, however, look upon hatcheries as institutions for trying to get his money and give as little as possible for it. After all, most of the profit on a first order is eaten up by overhead and the cost of getting the order. In other words, the profits that a hatchery makes are dependent upon their getting repeat orders and in order to do this they must give satisfaction.

Chicks frequently get chilled and as a result die from indigestion. When you buy chicks you can take steps to prevent this trouble. In the first place, of course, the brooder house should be heated for a few days before the chicks arrive, but more important perhaps, you can make arrangements with your postmaster to notify you as soon as they come and go for them yourself. Whereas the postman will deliver your chicks, you are taking a big chance if you allow them to ride for fifteen or twenty miles on a cold spring day. Sometimes subscribers tell us that they were not satisfied with the chickens but they either did not know how to refuse them, or they thought they would look better after they had them a few days. It is true it does not seem as easy to refuse baby chicks as it is livestock. However, in an extreme case and when you feel certain that you are not getting what you paid for, you may be justified in refusing to accept the shipment. Certainly, in our opinion, you are justified in refusing to accept it if the company ships you something which you have not ordered. Such cases have come to our attention a few times. One reader told us that he merely made an inquiry about chicks and in a week or so was surprised to receive a C. O. D. shipment. Such tactics are absolutely unjustifiable. In another instance brought to our attention a hatchery,

(Continued on Page 20)

Genuine Tom Barron Leghorns

Big, fat, fluffy chicks from five-pound breeders, will make you the most profit in large 26 ounce pure white eggs. Pullets laying in five months. and **GROWTH**
with

OATMEAL

The "*Ful-O-Pep Way*" is the *easy way* to build baby chicks into energetic layers and husky meat fowls. With the nourishing help of Quaker Ful-O-Pep Chick Starter, your downy hatch will change to feathered, one-pound birds in amazingly short order. • Oatmeal is a health and energy builder. Baby chicks respond to it by developing broad, deep bodies, capable of heavy egg production. It offers them materials they need for quick feather-making and for starting an unusual growth of firm breast meat. • Ful-O-Pep Chick Starter contains a variety of other valuable ingredients . . . cod liver meal, cod liver oil, molasses (in dry form), essential minerals, and a variety of grain ingredients are all blended together in scientific proportion. Each ingredient has its own special work to do. All of them are finely ground and thoroughly mixed so that at every mouthful the chick gets *all* of the ingredients. • *See Your Quaker Feed Dealer.*

From their first tiny crop-full until they are six weeks old, feed baby chicks Ful-O-Pep Chick Starter. This balanced baby chick starter with the oatmeal base can help you grow hardy, quick-feathering birds that are rarely troubled with common baby-chick ills.

without authorization, duplicated a C. O. D. shipment which had been refused and returned. When you do go for the chicks you can take the proper precaution to see that they do not become chilled.

Hatcheries Aim to Please

Summing up the few suggestions on getting your money's worth we would say: First, take plenty of time to study advertisements and catalogues before ordering. If there is a hatchery within fifty or sixty miles of you, you can well afford to take the time to make a personal visit. If you have secured good satisfaction in the past, there will be little incentive for changing unless you are certain that you are making an improvement. If you have not dealt with a hatchery or if you are certain that you wish to make a change, it will be worth while to talk with your neighbors and learn from them what hatcheries have given them satisfaction.

Second, do this studying early in the season and put in your order at the earliest possible moment. This does not mean that the chicks will be delivered immediately as you can tell the hatchery when you wish to have them. Your order will then be placed on file and you will be much more likely to get the chicks when you want them than you will if you wait until the last minute.

Third, do not be too quick to blame the hatchery in case the chicks do not come up to expectations. Be careful that they do not become chilled, feed them on a good ration, and keep their surroundings sanitary.

Fourth, if you do have complaints, make them promptly. You cannot logically expect to wait until fall before you tell what is wrong and then expect the hatchery to make some adjustment to you.

Fifth, most hatcheries do guarantee live delivery. Examine the chicks when they are delivered by the postman so that you will have a witness as to the condition and the number dead. Remember though, that most hatcheries put in a few extra chicks so if there are only a few dead it is probable that you are still getting the number that you ordered.

The vast majority of hatcheries are anxious to treat you fairly. It is unfortunate that there are a few that are unreliable. All kinds of chicks are hatched and sold for all kinds of prices. However, if you choose a hatchery which advertises in a reliable publication you will, on the average, get just about the quality of chicks which you pay for.

EXTRA Egg Profits

Free Book Tells How

If your hens are only average layers figure out how much extra money you'd make if you had birds that laid 200 to 300 eggs a year. Figure it out on an average yearly price of 50c a dozen.

That EXTRA profit is ALL profit for it costs no more to feed and keep HEAVY layers than it does average layers.

Poultrymen who are making real money are raising the famous WILLGERODT PEDIGREED WHITE LEGHORNS. These birds lay 200 to 300 eggs a year. And there's no guesswork about it. The trap-nest records prove it.

Bigger egg profits can be yours if you start a flock of WILLGERODT PEDIGREED WHITE LEGHORNS. You can do it either with hatching eggs or baby chicks. Remember each egg and each chick is the product of birds whose yearly egg record is 200 to 300 eggs.

Write for the Willgerodt Leghorn Book. It's full of valuable information and it's FREE.

RICH IN NOURISHMENT

**"COMPLETE IN
VITAMINS"**

Save the cost of Cod Liver Oil. This fine old chick food, rich in all the nourishments, is processed with an abundance of Sunshine Vitamin D

It takes more than animal products, grain, and minerals to make a baby chick food. The magic spark that enables a chick to assimilate these body-building foods are the vitamins!

With Pratts a new phrase has been added to the old one "rich in nourishment." The new phrase is "complete in vitamins." It has a deep significance.

Chicks must have Vitamins A and B in order to assimilate growth and weight from feed, and to resist disease. And D, the anti-rachitic vitamin, must be furnished for chicks to assimilate those foods that prevent leg weakness, crooked bone, poor frame.

That's why Pratts process the "original baby chick food" to make it complete in vitamins. Now chicks are

sure to get splendid growth-promoting nourishment from its ground hulled oats, dried buttermilk, meat scrap, cooked wheat, sterilized bone meal, ground whole-corn, wheat middlings, ground millet, rape, alfalfa meal.

It also takes extra minerals to build their bodies quickly, strongly, on a solid foundation for future health and long egg production. So a full supply of calcium, phosphates, magnesium for muscle, phosphorus for feathers, are all present in this splendid starting food.

Money can't buy and science can't make a better starting food for chicks. Pratts costs no more than any good food.

The difference in cost between it and the cheapest and poorest food is but a fraction of a cent per chick.

Write us for the name of your nearest Pratt dealer so you can reserve a season's supply now. He can also

supply an all-mash starter and growing food, if you prefer it.

We call your attention to two other feeds handled by the dealers: the splendid Pratt broiler mash, and the standard buttermilk growing mash that gives such remarkable results.

Beds and Bedding

We Consider the Place Where We Spend One-Third of Our Lives

IN the cold weather, or any other weather for that matter, beds are very important parts of our homes. We spend about one-third of our lives in them, so they deserve some care and thought. The twentieth century housewife has much to be thankful for. Among the many labor savers the modern bed and mattress are surely to be counted. If you have ever wrestled with a feather bed in a frantic endeavor to get it to lie evenly or with a dusty straw mattress that was equally refractory, you will appreciate fully the manufactured mattress that only needs a turn over each day.

Whether we buy cheap or more expensive makes will depend usually upon the depth of our purse, but a wise buyer will get the very best she can afford; they usually prove the cheapest in the long run.

Cheap springs are not long in sagging, and, when two persons sleep in a bed like that, it is very uncomfortable, for it is almost impossible to keep them from rolling into the centre.

Slip Covers for Mattress and Pillows

Mattresses should have slip covers made for them, when they are bought. Have two pieces of factory cotton (muslin), the same length and width as your mattress and sew between them a strip of cotton of the same width as your mattress is deep; allow for seams, of course. Snaps or buttons and buttonholes are used to close it at one end. This cover can be taken off and washed and boiled. This is not only more sanitary but also saves the mattress covering.

Another help is a piece of wool felt to cover the wire springs. It should be tied securely on so as not to worry one when turning the mattress. Mattresses should be turned every day; end for end one day and from side to side the next. Bed coverings should be turned over the foot of the bed on rising to allow for thorough airing. When making the bed turn back the clothes and remove one by one beginning with the top covering. Punch in pillows from opposite corners so as to rouse up the flattened feathers or down.

By the way, pillows are protected in the same way as mattresses with a slip of cotton over the ticking. Instead of fastening with buttons I sew them up with the sewing machine using the longest stitch. This is easily ripped open when the slip needs washing. Over this goes the regular pillow slip.

Sheets should be of ample length, especially the top sheet. Turned down a good six inches or more over the quilts and blankets they help to keep them clean and at the foot they should be tucked under the mattress.

Nothing is more uncomfortable on a cold night than to feel a cold draught coming in at one's feet. With a short double blanket it is an easy matter to fold it so that one half is longer than the other and can be tucked under the mattress and yet have a double thickness over one's body. With short single blankets one can lengthen them by sewing a strip of muslin on to the foot of them. This will go under the mattress and keep them in place.

Some housewives protect the top ends of their quilts and comforters with a muslin or cotton case that is about a foot or so deep. These are tacked or buttoned on. Coverings should, if possible, be of wool. Woolen blankets, light weight comforters and down quilts are the best. Heavy coverings cramp and tire one's body and are not healthful. Restful sleep is a very precious thing and a comfortably warm bed is a great help towards inducing it to come.

—MRS. T. T.

Early Spring Style Hints

THE stylists tell us that blue is to be the smartest color for spring, ranging in shade from dark blue to the daintiest and most delicate of light blues. All sorts of names are given blues such as Guardsman blue, admiral blue, clematis blue for the dark

shades, amulet blue and "flower" for the lighter shades.

Brown and varying shades of beige will be a close runner-up with blue for popular favor. Rich dark brown and the more delicate sea sand shades are named. Green, red, rose cedar and the light yellows are also prominent among fashion's favorite colors.

Prunes to Please a Prince

PRUNES have been called the poor man's dish, and yet in any of the following combinations they become a rare treat.

In cooking prunes for sauce it should be remembered that they must first be soaked for at least three hours in an earthen dish, in water to cover and

Shopping bag No. B-5535 comes stamped on yellow percale for easy quilting. The design is made up of applique patches of percale which are included in the package. Also included in the package are the wooden dowels for holding the bag firm at the top, button, snap fastener, padding for quilting, yellow percale for lining and black binding. This is a very practical and attractive bag. Price, 85c. Order from Embroidery Department, American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

then cooked very slowly in the same water until tender. But little additional sugar is required.

Prune Betty

Butter slices of bread, and in a pudding dish put alternating layers of bread and cooked, pitted prunes. When the dish is nearly filled pour in the juice from the prunes, cover closely and bake forty minutes in a slow oven. Serve either hot or cold with whipped cream or a pudding sauce.—L. M. T.

* * *

Prune Pudding No. 1

Stew one-half pound prunes, remove the stones and add one cupful sugar, one beaten egg, one scant cupful melted butter, one cupful bread crumbs. Mash these with a potato masher, add sweet milk to make a soft batter, pour into buttered pudding dish, cover and bake forty minutes. Uncover and brown.—L. M. T.

* * *

Prune Pudding No. 2

Cook large prunes in a very little water, until tender but not soft, and quarter. Mix two soup spoonfuls cornstarch, with one-fourth cupful cold milk. Bring one cupful top milk to boiling point, stir in cornstarch, a dust of salt and a few grains of nutmeg. Cook on asbestos mat until mixture thickens. Stir in one-fourth cupful sugar, one-half teaspoonful lemon extract, and one cupful prunes. Remove from fire, stir in stiffly beaten white of one egg, chill and serve.—L. M. T.

Prune Fluff Salad

Cook large prunes until tender, allowing all juice to evaporate before they are removed from the fire. Do not have as soft as for sauce. Remove stones carefully and cut in quarters lengthwise. Cut pecan meats in shreds, and add to the prunes. Sprinkle lightly with a few grains of salt and paprika, two tablespoonfuls lemon juice and one

tablespoonful grape juice. Toss lightly, cover with one cupful whipped cream arrange on heart leaves of lettuce, chill and serve.—L. M. T.

* * *

Prune Chocolate Balls

Wash one cupful of prunes and dry them on a soft cloth. Remove stones and run through a food chopper. Combine the prunes with one tablespoonful granulated sugar and one teaspoonful honey. Form in balls, dip in melted sweet chocolate and dry on waxed paper.—L. M. T.

Oneida County in Contest

FROM Oneida County comes the news that the County Home Bureau has donated \$25.00 for prizes for the best plans made this year for improving school yards in that county as a feature of the Rural School Beautification Contest. One successful florist and nurseryman, a native of Sweden, has donated \$20.00 worth of shrubs for the best plan to be given in prizes. His reason for doing so was that in his native country the school yards are objects of beauty. It is very pleasing to encourage a project which looks towards making our own school surroundings more attractive. He is also donating a silver cup to be given to the school that does the most towards beautifying its grounds, and he is willing to continue the cup prize for the next five years.

The local Home Bureau of Rome has donated \$25.00 for the schools entering the contest in that city.

Aunt Janet's Corner

A Man Stands Up for Male Housekeepers

THE old argument as to whether men should do women's work has received new attention in a recent copy of the American Mercury by Mr. Ralph M. Farley. This gentleman says that men are far better at housekeeping than women are. He makes some rather sweeping charges against the gentler sex; perhaps he is right in some of the things he says. He accuses women of failing as housekeepers for four reasons;

1. They are unalterably conservative
2. They won't accept improvements
3. They are not mechanical
4. They won't follow directions

He illustrates every one of these points by incidents from his own observation, one of them being that a woman who had been presented with a good electric dish washing machine scrapped it at the first opportunity because she said it cluttered up the kitchen sink. The long and short of his argument was, that men would be better housekeepers than women.

He did not enter into a discussion as to whether women are better at business than men. Furthermore, the great loophole in his whole argument is that he did not take into consideration that a stupid woman would be poor at anything, just the same as a stupid man would be, either in business or in housekeeping. The idea that because a woman is a woman she must, there-

fore, be a good housekeeper does not hold true any longer. We do not expect every man to qualify as a mechanic or a truck driver just because he is a man. If we do, from my own personal experience with men mechanics, I could say we would be disappointed. There is no definite answer to Mr. Farley's statement because there is no way to give the matter a fair test. No doubt the men who are good mechanics and good organizers could help us struggling women with many of the mechanical aspects of housekeeping, and it is just as true that many of the successes earned by men, either in business or on the farm, have been

Jacket Dress

2968

Pattern No. 2968 is a charming adaptation of the indispensable spring coat and frock. Blue and white thin woolen plaid is used for the coat and skirt, while the upper part of the bodice is in a matching blue shade of plain woolen. It may also be made in contrasting flat crepe silk or wool jersey, or even with a silk dress and velveteen jacket. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4½ yards of 39-inch material with 1½ yards of 39-inch contrasting. Price, 15c.

due to the business intelligence of their wives. At any rate, it is stimulating to have our abilities challenged once in a while and to look at our job from the view point of one on the outside, who perhaps sees the faults better than we realize.

Before ending this bit of philosophy I want to remind our Corner Readers that we would like to hear from them regarding the time schedule which our reader requested in last week's issue. This is in the nature of a contest and we are offering three dollars for the best letter telling how to organize the work of the day and of the week so as to allow time for extra sewing and other seasonal jobs. Two dollars will be paid for the next best letter, and one dollar for all others printed. These letters should not be over three hundred words in length, and should be mailed to Aunt Janet before March 8.

—AUNT JANET.

Charming Spring Style

2985

Dress pattern No. 2985 is like a breath of spring itself, with its pretty printed crepe silk and graceful cowl collar. The flounced sleeve frills are very modish just now, and the curved outline of the skirt is both graceful and comfortable. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3¾ yards of 39-inch material with ½ yard of 35-inch contrasting. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps. (Don't send coin). Add 12c for one of the new Spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR

That's why

CLOTHES WASHED WITH FELS-NAPTHA LOOK AND SMELL SO NICE!

FELS-NAPTHA's *extra* help makes it easier to give clothes the fragrant, airy, clover-field sweetness that comes only when clothes are clean through and through!

That's because Fels-Naptha brings you *two* cleaners instead of *one*. Not "just soap," but good golden soap and plenty of naptha combined in a generous bar. Working together, these two busy cleaners give you *extra* help—dissolving grease, loosening every particle of dirt and washing it away—safely, quickly, thoroughly!

Fels-Naptha's *extra* help does away with hard rubbing, too. That saves your clothes. It saves you. And did you know that there's bland, soothing glycerine in every Fels-Naptha bar? Did you know that, because it works so quickly and gets your hands out of water sooner,

Fels-Naptha also saves your hands?

Next washday, be bargain-wise—try Fels-Naptha. It works well in tub or machine. For soaking or boiling. In hot, lukewarm or cool water. Get it at your grocer's.

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today: Dept. 1-2-14, Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR

FELS-NAPTHA

To End a Cough In a Hurry, Mix This at Home

To end a stubborn cough quickly, it is important to soothe and heal the inflamed membranes, get rid of the germs and also to aid the system inwardly to help throw off the trouble.

For these purposes, here is a home-made medicine, far better than anything you could buy at 3 times the cost. From any druggist, get 2½ ounces of Pinex. Pour this into a pint bottle, and add plain granulated sugar syrup or strained honey to fill up the pint. This takes but a moment, and makes a remedy so effective that you will never do without, once you have used it. Keeps perfectly, and children like it.

This simple remedy does three necessary things. First, it loosens the germ-laden phlegm. Second, it soothes away the inflammation. Third, it is absorbed into the blood, where it acts directly on the bronchial tubes. This explains why it brings such quick relief, even in the severe bronchial coughs which follow cold epidemics.

Pinex is a highly concentrated compound of genuine Norway Pine, containing the active agent of creosote, in a refined, palatable form, and known as one of the greatest healing agents for severe coughs, chest colds and bronchial troubles. Do not accept a substitute for Pinex. It is guaranteed to give prompt relief or money refunded.

BURPEE'S GARDEN BOOK

In planning your garden, consult Burpee's Annual. It offers the newest and widest selections for growing more beautiful flowers and improved vegetables. Write for your copy today. It's free. W. Atlee Burpee Co. 8 Burpee Bldg., Philadelphia, Pa.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is lonely but several new friends make life more pleasant for him. There is blind Joe Glaspell who plays the violin, Jack and his sister, Jill, who rescue him when he gets into a fight over a kitten, and his "Lady of the Roses" who lives in the beautiful house on the hill.

It develops that Jack and the "Lady of the Roses" are not on good terms. One day Jack tells David and Jill a fairy story about "the princess and the pauper." The story is so consistent that it is difficult to imagine that it is entirely fiction.

THERE was no mention of towers or flags; no reference to wavings or to childhood's days. There was only a stiffly polite little conversation about colleges and travels, with a word or two about books and plays. Then the callers went home. On the way the boy smiled scornfully to himself. He was trying to picture the beautiful vision he had seen, this unapproachable Princess in her filmy lace gown,—standing in the tower window and waving—waving to a bit of a house on the opposite hill. As if that could happen!

"The boy, during those last three years, had known only books. He knew little of girls—only one girl—and he knew still less of Princesses. So when, three days after the call, there came a chance to join a summer camp with a man who loved books even better than did the boy himself, he went gladly. Once he had refused to go on this very trip; but then there had been the girl. Now there was only the Princess—and the Princess didn't count."

"Like the hours that aren't sunshiny," interpreted David.

"Yes," corroborated Mr. Jack. "Like the hours when the sun doesn't shine."

"And then?" prompted Jill.

"Well, then,—there wasn't much worth telling," rejoined Mr. Jack gloomily. "Two more years passed, and the Princess grew to be twenty-one. She came into full control of her property then, and after a while she came back to the old stone house with the towers and turned it into a fairyland of beauty. She spent money like water. All manner of artists, from the man who painted her ceilings to the man who planted her seeds, came and bowed to her will. From the four corners of the earth she brought her treasures and lavished them through the house and grounds. Then, every summer, she came herself, and lived among them, a very Princess indeed."

"And the boy?—what became of the boy?" demanded David. Didn't he see her—ever?"

Mr. Jack shook his head.

"Not often, David; and when he did, it did not make him any—happier. You see, the boy had become the Pauper; you mustn't forget that."

"But he wasn't a Pauper when you left him last."

"Wasn't he? Well, then, I'll tell you about that. You see, the boy, even though he did go away, soon found out that in his heart the Princess was still the girl, just the same. He loved her, and he wanted her to be his wife; so for a little—for a very little—he was wild enough to think that he might work and study and do great things in the world until he was even a Prince himself, and then he could marry the Princess."

"Well, couldn't he?"

"No. To begin with, he lost his

health. Then, away back in the little house on the hill something happened—a something that left a very precious charge for him to keep; and he had to go back and keep it, and to try to see if he couldn't find that lost health, as well. And that is all."

"All! You don't mean that that is the end!" exclaimed Jill.

"That's the end."

"But that isn't a mite of a nice end," complained David. "They always get married and live happy ever after—in stories."

"Do they?" Mr. Jack smiled a little sadly. "Perhaps they do, David,—in stories."

"Well, can't they in this one?"

"I don't see how."

"Why can't he go to her and ask her to marry him?"

Mr. Jack drew himself up proudly.

"The Pauper and the Princess? Never! Paupers don't go to Princesses, David, and say, 'I love you.'"

David frowned.

"Why not? I don't see why—if they want to do it. Seems as if somehow it might be fixed."

"It can't be," returned Mr. Jack, his gaze on the towers that crowded the opposite hill; "not so long as always before the Pauper's eyes there are those gray walls behind which he pictures the Princess in the midst of her golden luxury."

To neither David nor Jill did the change to the present tense seem strange. The story was much too real to them for that.

"Well, anyhow, I think it ought to be fixed," declared David, as he rose to his feet.

"So do I—but we can't fix it," laughed Jill. "And I'm hungry. Let's see what there is to eat!"

CHAPTER XVIII

DAVID TO THE RESCUE

IT was a beautiful moonlight night, but for once David was not thinking of the moon. All the way to the Holly farmhouse he was thinking of Mr. Jack's story, "The Princess and the Pauper." It held him strangely. He felt that he never could forget it. For some reason that he could not have explained, it made him sad, too, and his step was very quiet as he went up the walk toward the kitchen door.

It was after eight o'clock. David had taken supper with Mr. Jack and Jill, and not for some hours had he been at the farmhouse. In the doorway now he stopped short; then instinctively he stepped back into the shadow. In the kitchen a kerosene light was burning. It showed Mrs. Holly crying at the table, and Mr. Holly, white-faced and stern-lipped, staring at nothing. Then Mrs. Holly raised her face, drawn and tear-stained, and asked a trembling question.

"Simeon, have you thought? We might go—to John—for—help."

David was frightened then, so angry was the look that came into Simeon Holly's face.

"Ellen, we'll have no more of this," said the man harshly. "Understand, I'd rather lose the whole thing and—and starve, than go to—John."

David fled then. Up the back stairs he crept to his room and left his violin. A moment later he stole down again and sought Perry Larson whom he had seen smoking in the barn doorway.

"Perry, what is it?" he asked in a trembling voice. "What has happened—in there?" He pointed toward the house.

The man puffed for a moment in silence before he took his pipe from his mouth.

"Well, sonny, I s'pose I may as well tell ye. You'll have ter know it sometime, seein' as 'twon't be no secret

long. They've had a stroke o' bad luck—Mr. an' Mis' Holly has."

"What is it?"

The man hitched in his seat.

"By sugar, boy, I s'pose if I tell ye, there ain't no sartinty that you'll sense it at all. I reckon it ain't in your class."

"But what is it?"

"Well, it's money—and one might as well talk moonshine to you as money, I s'pose; but here goes it. It's a thousand dollars, boy, that they owed. Here, like this," he explained, rummaging his pockets until he had found a silver dollar to lay on his open palm. "Now, jest imagine a thousand of them; that's heaps an' heaps—more'n I ever see in my life."

"Like the stars?" guessed David.

The man nodded.

"Ex-actly! Well, they owed this—Mr. an' Mis' Holly did—and they had agreed ter pay it next Sat'day. And they was all right, too. They had it plum saved in the bank, an' was goin' ter draw it Thursday, ter make sure. An' they was feelin' mighty pert over it, too, when ter-day along comes the news that somethin's broke kersmash in that bank, an' they've shet it up. An' nary a cent can the Hollys git now—an' maybe never. Anyhow, not 'fore it's too late for this job."

"But won't he wait?—that man they owe it to? I should think he'd have to, if they didn't have it to pay."

"Not much he will, when it's old Streeter that's got the mortgage on a good fat farm like this!"

David drew his brows together perplexedly.

"What is a—a mortgage?" he asked. "Is it anything like a *porte-cochere*? I know what that is, 'cause my Lady of the Roses has one; but we haven't got that—down here."

Perry Larson sighed in exasperation.

"Gosh, if that ain't 'bout what I expected of ye! No, it ain't even second cousin to a—a—that thing you're a-talkin' of. In plain wordin', it's jest this: Mr. Holly, he says ter Streeter: 'You give me a thousand dollars and I'll pay ye back on a certain day; if I don't pay, you can sell my farm fur what it'll bring, an' take yer pay. Well, now here 't is. Mr. Holly can't pay, an' so Streeter will put up the farm fur sale."

"What, with Mr. and Mrs. Holly living here?"

"Sure! Only they'll have ter git out, ye know."

"Where'll they go?"

"The Lord knows; I don't."

"And is *that* what they're crying for—in there?—because they've got to go?"

"Sure!"

"But isn't there anything, anywhere, that can be done to—stop it?"

"I don't see how, kid,—not unless some one ponies up with the money 'fore next Sat'day,—an' a thousand o' them things don't grow on ev'ry bush," he finished, gently patting the coin in his hand.

At the words a swift change came to David's face. His cheeks paled and his eyes dilated in terror. It was as if ahead of him he saw a yawning abyss, eager to engulf him.

"And you say—*money* would—fix it?" he asked thickly.

"Ex-act-ly!—a thousand o' them, though, 't would take."

A dawning relief came into David's eyes—it was as if he saw a bridge across the abyss.

"You mean—that there wouldn't *anything* do, only silver pieces—like those?" he questioned hopefully.

"Sugar, kid, 'course there would! Gosh, but you be a checkerboard o' sense an' nonsense, an' no mistake! Any money would do the job—any

money! Don't ye see? Anything *that's* money."

"Would g-gold do it?" David's voice was very faint now.

"Sure!—gold, or silver, or greenbacks, or—or a check, if it had the dough behind it."

David did not appear to hear the last. With an oddly strained look he had hung upon the man's first words; but at the end of the sentence he only murmured, "Oh, thank you," and turned away. He was walking slowly now toward the house. His head was bowed. His step lagged.

"Now, ain't that jest like that chap," muttered the man, "ter slink off like that as if he was a whipped cur. I'll bet two cents an' a doughnut, too, that in five minutes he'll be what he calls 'playin' it' on that 'ere fiddle o' his. An' I'll be derved, too, if I ain't curious ter see what he *will* make of it. It strikes me this ought ter fetch some-thin' first cousin to a dirge!"

On the porch steps David paused a breathless instant. From the kitchen came the sound of Mrs. Holly's sobs and of a stern voice praying. With a shudder and a little choking cry the boy turned and crept softly upstairs to his room.

He played, too, as Perry Larson had wagered. But it was not the tragedy of the closed bank, nor the horror of the threatened farm-selling that fell from his violin. It was, instead, the swan song of a little pile of gold—gold which lay now in a chimney cupboard, but which was soon to be placed at the feet of the mourning man and woman downstairs. And in the song was the sob of a boy who sees his house of dreams burn to ashes; who sees his wonderful life and work out in the wide world turn to endless days of weed-pulling and dirt-digging in a narrow valley. There was in the song, too, something of the struggle, the fierce yea and nay of the conflict. But, at the end, there was the wild burst of exaltation of renunciation, so that the man in the barn door below fairly sprang to his feet with an angry:—

"Gosh! if he hain't turned the thing into a jig—durn him! Don't he know more'n that at such a time as this?"

Later, a very little later, the shadowy figure of the boy stood before him.

"I've been thinking," stammered David, "that maybe I—could help, about that money, you know."

"Now, look a-here, boy," exploded Perry, in open exasperation, "as I said in the first place, this ain't in your class. 'Tain't no pink cloud sailin' in the sky, nor a bluebird singin' in a blackb'rry bush. An' you might 'play it'—as you call it—till doomsday, an' 'twouldn't do no good—though I'm free ter confess that your 'playin' of them 'ere other things sounds real pert an' chirky at times; but 'twon't do no good here."

David stepped forward, bringing his small, anxious face full into the moonlight.

"But 't was the money, Perry; I meant about the money," he explained. "They were good to me and wanted me when there wasn't any one else that did; and now I'd like to do something for them. There aren't so *many* pieces, and they aren't silver. There's only one hundred and six of them; I counted. But maybe they'd help some. It—it would be a—start." His voice broke over the once beloved word, then went on with renewed strength. "There, see! Would these do?" And with both hands he held up to view his cap sagging under its weight of gold.

Perry Larson's jaw fell open. His eyes bulged. Dazedly he reached out and touched with trembling fingers the heap of shining disks that seemed in

(Continued on Page 26)

When You Sell Timber

How To Get a Fair Price

By R. R. FENSKA,
New York State College of Forestry

HOW many board feet of lumber or cords of wood have you on your lot and how much is it worth?

If the average small woodlot owner were asked the above question, he would, in most cases, reply, "I don't know." Such ignorance has resulted in many an owner selling his timber at a sacrifice. The buyer of standing timber always knows the value of a woodlot. When he discovers the owner does not realize its worth he sometimes takes advantage of it. Often he has purchased timber at a ridiculously low figure simply because the lump sum price sounded big to the owner.

Guessing Usually Ends in a Loss

Once in a while, however, some farmer gets the impression he has a "Bonanza" or gold mine in his woodlot and refuses a fair price when offered.

A portable mill operator once made a certain woodlot owner an offer for his seven acre tract. The price was about what the timber was worth but the owner held out for nearly twice the amount offered. Not until the millman moved out of that particular region did the owner of the woodlot discover to his sorrow that he could not then get even the price originally offered him. It is, therefore, good business for an owner of timberland, if he desires to sell, to find out how much his woodlot is really worth.

Not so long ago a farmer in Western New York was asked by a representative from a wood-using industry how much he would take for the timber on his woodlot. The farmer replied, "How much am I offered?" The prospective buyer took out a pencil and notebook and began to do some figuring. Finally he said, "Well, there are 90,000 board feet on your lot and since it looks like good timber I'll give you \$20.00 a thousand feet on the stump." This, of course, made a total of \$1800 and the prospective buyer was willing to pay cash. It looked tempting to the farmer. Probably nine out of ten would have closed the deal by giving the buyer an option on the timber at the above price. This particular farmer, however, wondered if 90,000 feet of timber and \$20.00 a thousand were the correct amount and the right price for his trees. He remembered reading in his farm journal that one should always have an estimate made of timber before selling it. He told his prospective buyer he would like a few days to think it over.

Expert Estimates Put Seller in Best Position

In the meantime he consulted with a forester and they both agreed to go over the woodlot together. One look convinced the forester that the price of \$20.00 a thousand was a fair one. The timber was especially large, of good quality, easy logging conditions, and right on a main concrete highway. Although plenty of stumpage could be bought for half this price this particular timber was really of the highest class and worth the price offered per thousand board feet.

The only question now was to determine if there were 90,000 feet on the area. Walking through the timber to find the boundaries of the area, the forester's suspicions were immediately aroused. He informed the farmer that he had at least 100,000 feet and probably more. The only way to find out was through a careful estimate of the timber. The farmer asked how much such an estimate would cost. He was told. Immediately he authorized the forester to proceed with a 100% estimate (that is, every tree was estimated for merchantable contents).

At the end of a glorious day in the woodlot, the forester had his data. That evening he began to compute and compile his figures. Finally the job was finished. His suspicions were confirmed. Instead of 90,000 or 100,000 board feet, the woodlot actually contained 134,000

board feet. These facts were conveyed to the farmer in a simple and concise report. The farmer wrote his prospective buyer that he would sell his timber at \$20.00 a thousand feet but that he found he had 134,000 instead of 90,000 board feet. This immediately brought the representative from the factory to the woodlot and began checking up his former calculations. Finally he offered to "split the difference". The farmer, however, held out for 134,000 at \$20.00 per M or \$2,680 for the lot. The buyer went back to his company. In a day he returned and paid the farmer \$2,680 for his timber or \$880 more than the original offer.

Not All Log Scales Are Fair

Another way a farmer may easily be "gipped" is in selling his logs by log scale. Some scales give about everything that can be sawed out of a log, but others through faulty construction and application, give only about half or a third of the actual contents of a log. The average farmer doesn't know one rule from another.

International Log Rule Official

There has recently been passed a law in New York State making the International Log Rule the official rule for all cases where a dispute arises as to contents of logs and no log rule is specified. This rule gives the full amount that can be cut from sound logs and should be insisted upon by all farmers when they cut and sell their logs. All other log rules give a less amount and therefore favor the buyer. Cases can be cited where a buyer bought logs for \$10.00 a thousand by the Doyle Rule and sold them for \$10.00 a thousand by the Scribner Rule and yet made a good profit.

When a farmer decides to cut and saw his timber himself into lumber for the market, he will usually find it to his advantage to make arrangements for the sale of his product before he begins sawing. In this way he will not saw his ash logs into inch lumber when 2-inch ash plank is the size in demand by the trade.

It is always good business and management for any woodlot owner, who is anxious to sell his lumber, logs or timber, to find out beforehand how much he has on his tract, what demand there is for it and what it is worth.

Booklet On Wood Floors

THOSE of our readers interested in new or remodeled homes, refinishing old floors, porch floors, and so on, will find some interesting and valuable information in the new free handbook "Wood Floors", just put out by the National Lumber Manufacturers Association, Washington, D. C.

The new publication, which will be distributed free to interested persons in single copies, covers the entire field

of wood floor construction possibilities for the average home, including the modern tendency toward the reproduction of period type floors in both hardwoods and softwoods. It is fully illustrated.

Appearance, adaptability, wearing qualities, warmth, dryness, and cost are discussed for each type of residential floor together with its architectural adaptability. Under the general heading of "How to Make A Good Floor", such points as stiffness, grades and sizes of material, size of joists, sub-floorings, matchings, and general construction are covered. Finishing, waxing, when to lay the floor, how to lay the floor, wood floors on concrete, porch floors, canvas decks, and the resurfacing of old floors are other chapter headings inviting to the home enthusiast.—I. W. D.

Preventing Farm Fires

Fires on the farm can be prevented. Following are suggestions from the National Fire Protection Association:

Provide a system of running water under pressure.

Provide all buildings with proper lightning protection equipment.

Rebuild all defective chimneys and see that all heating apparatus is properly installed. Keep chimneys, flues and stoves clean.

Allow no smoking in barns, or elsewhere where combustible material is stored.

Use fire retarding roofings.

Thoroughly cure hay, pea vines, and other roughage, before these are stacked in barns. Do not allow horse manure to accumulate in large piles in stables or against buildings.

Provide proper facilities for the storage and handling of gasoline and kerosene. Do not use gasoline for home cleaning or kerosene for starting fires.

Make sure all electric wiring and devices are properly installed.

How to Prevent Accidents

EVER since time began, the principle of "safety first" has had three enemies. One is the desire men have to "take a chance" and see what happens. A second is carelessness and the third is thoughtlessness.

Although manufacturers of farm equipment have made many improvements in recent years to make their products safer, more reliable and more dependable, it is still and always will be important for operators to exercise care and precaution in their use. D. A. Milligan of Illinois has outlined the following list of "safety first" suggestions which he believes would be helpful in preventing injuries and accidents.

Don't walk behind horses when they are pulling hard. A single tree, trace or double tree might break and strike the driver.

Don't place yourself in such a position when working on machinery that you would be injured if the horses moved. The most trusted horse might take a step. Only a second is required to drop the traces.

Don't rely on clutches while working on or around implements which are attached to or are driven by a tractor. Place the gear shift lever in neutral

so if the clutch should engage no harm is done.

Don't attempt to make adjustments on tractors while they are moving. You might lose your balance or slip.

Don't reach around moving power machinery wearing gloves with large cuffs or with jacket or coat unbuttoned.

Don't reach across a moving saw or work around one with refuse lying under your feet.

Don't stand in the line of movement of pulleys, wheels, etc. A wheel or belt might break or an attachment might loosen and be thrown.

Don't operate high-speed emery wheels without a shield over the emery wheel. Keep your eyes above the work being ground and wear goggles.

Don't stand beside or hold wire while it is being stretched. It might break.

To Avoid Auto Accidents

IT would hardly seem necessary to emphasize the ordinary rules of the road in order to avoid accidents but the very large number of smash-ups which continue to be reported in the paper indicate that many do not obey even the simplest of rules. Therefore we are glad to emphasize the following cautions given by Commissioner Charles A. Harnett of the New York State Bureau of Motor Vehicles. If they prevent even one accident we will be well repaid for our trouble. Here are the suggestions:

Do not drive upon a railroad crossing at a grade crossing before making sure a train is not approaching.

Obey all traffic signals and heed all warnings.

Do not speed on crowded thoroughfares.

Do not attempt to pass unless the opposite lane is clear of cars.

See that your automobile is in good condition mechanically before starting out.

Do not drive on the left side of the highway.

Be sure to signal your intention when about to pass, turn or stop.

Steel Square Pocket Book

EVERY wideawake carpenter and repair man who wants to get ahead and be able to show more skill than his competitors will thank us for calling to his attention the complete and practical little book "The Steel Square Pocket Book" by Stoddard, and published at \$1.00 by the Scientific Publishing Co., New York City.

This is a pocket size book of 180 pages and 184 diagrams devoted entirely to the practical uses of the steel square found in ordinary building work. Some of the things taken up are the different types of steel squares; laying out octagons, circles, ellipses, ovals, and so on; how to find different pitches and angles; how to lay out ordinary rafters of different pitches, valley rafters, hip rafters, jack rafters, and other types of roofs; laying out framing and braces; stair risers, treads, balusters, and so on; and a large number of miscellaneous problems which can be quickly solved with the square if one only knows how.—I.W.D.

AGRICULTURE FOR RURAL TEACHERS by Thomas Carson McCormick differs from the usual text-book on agriculture in some very vital respects. First of all, it does not attempt to do vocational teaching in agriculture but rather lays a cultural foundation of general information about rural living which applies to all boys and girls whether they plan to continue living on the farm or to go elsewhere. It emphasizes the appreciation of agriculture and leaves the vocational or technical training to the higher and more specialized school. Professor McCormick wrote the book as a result of the demand of a general course in agriculture rather than several courses of technical work such as animal husbandry or agronomy. It takes into account the new influences at work in agriculture such as boys' and girls' clubs and demonstration work with men and women.

A very helpful list of questions follows each chapter. Ample references are also included. MacMillan, \$1.80.

Just David

(Continued from Page 24)

the mellow light like little earth-born children of the moon itself. The next instant he recoiled sharply.

"Great snakes, boy, where'd you git that money?" he demanded.

"Of father. He went to the far country, you know."

Perry Larson snorted angrily.

"See here, boy, for once, if ye can, talk horse-sense! Surely, even you don't expect me ter believe that he's sent you that money from—from where he's gone to!"

"Oh, no. He left it."

"Left it! Why, boy, you know better!"

There wa'n't a cent—hardly—found on him."

"He gave it to me before—by the roadside."

"Gave it to you! Where in the name of goodness has it been since?"

"In the little cupboard in my room, behind the books."

"Great snakes!" muttered Perry Larson, reaching out his hand and gingerly picking up one of the gold-pieces.

David eyed him anxiously.

"Won't they—do?" he faltered.

"There aren't a thousand; there's only a hundred and six; but—"

"Do!" cut in the man, excitedly. He had been examining the gold-piece at close range. "Do! Well, I reckon they'll do. By Jiminy!—and ter think you've had this up yer sleeve all this time! Well, I'll believe anythin' of yer now—anythin'! You can't stump me with nuthin'! Come on." And he hurriedly led the way toward the house.

"But they weren't up my sleeve," corrected David, as he tried to keep up with the long strides of the man. "I said they were in the cupboard in my room."

There was no answer. Larson had reached the porch steps, and had paused there hesitatingly. From the kitchen still came the sound of sobs. Aside from that there was silence. The boy, however, did not hesitate. He went straight up the steps and through the open kitchen door. At the table sat the man and the woman, their eyes covered with their hands.

With a swift overturning of his cap, David dumped his burden onto the table, and stepped back respectfully.

"If you please, sir, would this—help any?" he asked.

(Continued Next Week)

HANDY ANDY Says "Here's How"

To Use Old B-Batteries

By Ray Inman

DISCARDED Radio B-Batteries retain a fair amount of voltage. YOU CAN USE IT.

CONNECT UP 2 or 3 of these old batteries with a switch, and wire to an electric socket and 25 watt lamp.

This will give you a good light for cellar or closet, if used but a few moments at a time . . .

Pays Higher Fee on Trucks

I have owned a truck since 1915. When I want to get my 1931 license I find rates are 80c a ton. The chassis weighs 3500 pounds, the body 1700, making 5200 in all. The license would be \$41.60. In former years I paid \$32.00. They say they have reduced the license fee yet I would have to pay \$9.60 more. This is a one ton truck.

The big dump trucks that load from 6 to 8 tons, use the road every day, and cut ruts in them with heavy loads get their license from \$20 to \$35 cheaper this year. I am a farmer and do not use the road much and am supposed to pay more in these years of hard times for farmers.

WE referred this question to the State Bureau of Motor Vehicles. They report a change in the basis of charges for licenses on trucks. Formerly licenses were based on the combined weight and carrying capacity at a rate of \$8.00 a ton or fraction of a ton. Now fees on trucks are based on the weight of the vehicle alone at the rate of 80c a hundred or major fraction of a hundred. In some cases this results in a fee somewhat smaller. The idea is that the size of the fee will not be changed greatly, assuming that the truck should carry a load equal to its own weight. Apparently in the case of our subscriber, the truck weight is heavier than it should be for its capacity.

The reason for changing the law was that it was difficult to have a check on the load because it would vary from time to time. It is well known that many trucks are loaded higher than their rated capacity. The Bureau of Motor Vehicles assured us that the change was not made with the idea of increasing the fee. Unfortunately, the fee has been increased for some of our subscribers at a time when they cannot afford any increase in expenses.

State Troopers Again on the Job

A SUBSCRIBER recently reported that a check given him by William Brown had been protested at his own bank. The check was given our subscriber in payment for eggs. We wrote Captain W. W. Robinson of Troop "A" New York State Troopers of Batavia, who replied:

"In reference to your letter of the 22nd of December 1930, concerning the complaint of Albert E. Starling, Medina, N. Y., this is to report that William Sharts, alias Walter Sharts, William Brown, William Ross, has been apprehended and is now held for the action of the Erie County Grand Jury on a charge of abandonment in violation of Section 480 of the Penal Law, a felony. This subject is held at the Erie County Jail in Buffalo. He abandoned four children, under the age of twelve.

This subject is the person who gave your complainant the worthless check for \$18.00. He also passed a number of worthless checks in Niagara County and is wanted for the same charge of warrants against Sharts and he will be prosecuted on these after the present felony case is disposed of."

The Easy Puzzle Scheme

About a month and a half ago, I worked out a puzzle in a magazine and sent it in to the firm. The name of the firm is "National Home Magazine, Inc., 37 W. Van Buren St., Chicago, Ill." The manager's name is L. Shulman. The first prize that is up is a Buick Sedan and cheaper cars for smaller prizes. L. Shulman asked me to get subscribers for the Gentlewoman magazine. I have sent in six dollars worth of subscriptions and on my official receipt, I have 519,000 auto votes toward the Buick Sedan. The contest ends May 25, 1931. I also have a Charter Membership certificate. The receipt and certificate are both signed by L. Shulman. He asked me to keep on getting subscriptions and he wrote a very encouraging letter. I'm willing to keep on working if there are any chances of getting one of the prizes.

A few days ago, he sent me the names

of the people that won in the last contest. I was talking with one of your subscribers last night and he told me before I worked any more to write you and ask you if this firm was honest and reliable and you would tell me.

OUR subscriber enclosed a letter from this publication designed to encourage her and make her feel that she stood an excellent chance of winning a prize. However, if our subscriber had examined the letter closely, she would have found that it was a printed or mimeographed letter and not an individual typewritten letter sent to her only. Probably the same encouraging letter went out to thousands of other persons who answered the puzzle.

It goes without saying that no company is going to give an automobile for answering a puzzle and getting a few subscriptions. People enter contests from all over the country, and, assuming that the prizes are actually given, it is evident that the one who wins it will have to get an enormous number of subscriptions.

A large number of companies have submitted "easy puzzle scheme" advertising to the American Agriculturist but we do not accept any of them.

Cash Your Checks Promptly

A SUBSCRIBER recently asked us to check up on a shipment sent by him to a man in Philadelphia. He received a check in payment but when it was deposited it came back with a note that the bank on which the check was drawn had closed its doors.

We immediately got in touch with H. A. Hanemann, Market Analyst of the Pennsylvania Department of Agriculture, who reports to us that three rather large banks in Philadelphia recently closed their doors, one of them being the Bankers Trust Company. It seems that this bank is patronized rather largely by commission men in Philadelphia, and as a result they have been rather badly hit. Of course, the fact that the bank is in difficulty does not relieve the commission men of responsibility to pay shippers for produce, but if it puts them into too bad a financial state, they are simply unable to pay.

We are glad to be able to report that these banks that are now in the hands of the Secretary of Banking believe that they will be able to pay obligations without loss to any depositors. We trust that this is so and that all of our subscribers will get pay for produce sent to Philadelphia commission men who had their accounts with this bank. Incidentally, may we remind you to cash all checks promptly.

Will They Live Up To It

SUBSCRIBER asked us about a correspondence school which sells, for \$100, a correspondence course in installing loud speakers and radio equipment. He enclosed a beautiful guarantee in which the school agrees to have a job ready for the student when he completes the course at a starting salary of \$50 a week.

It seems to us that there are two loopholes in this guarantee. In the first place, the figures we have available indicate that less than 10% of all persons who sign contracts for correspondence school ever complete the course. Perhaps this particular course has even a smaller percent of students who complete the course of instruction. The second loophole is that this guarantee will do a student no good if he should find the school has discontinued business about the time he finishes the course. It is surprising how easy it is to discontinue such a business over night and open up under a new name the next morning. Common sense tells us that no correspondence school can live up to such a guarantee.

LOWEST PRICES in years for KALAMAZOO QUALITY

Easiest Terms \$5 DOWN ONLY ON ANYTHING

Mail Coupon for New FREE BOOK

SAVE Kalamazoo Stoves and Ranges approved by Good Housekeeping Institute 1/3 to 1/2 at Factory Prices

Send today for this Sensational Sale Book! It's NEW! It's FREE!

It slashes factory prices to rock-bottom—the lowest prices in years for Kalamazoo quality! Over 200 styles and sizes—the Biggest Bargains ever—savings of 1/3 to 1/2. And the Easiest of Terms—Only \$5 Down on Anything—A Whole Year to Pay.

Lowest Factory Prices

Mail the Coupon Now! Only \$38.55 up for Coal and Wood Ranges. Only \$77.60 up for Combination Coal and Gas Ranges. Only \$25.60 up for Gas Stoves, \$46.85 up for Cabinet Heaters, \$16.50 up for Oil Ranges, \$55.45 up for Furnaces.

Beautiful Colored Ranges

Send for this wonderful Book! IT'S FREE! See the modern coal and wood Ranges, and Combination Coal and Gas Ranges in glistening, colorful Porcelain Enamel. Above: After selling some pullets, Mrs. J. R. Burns put 600 in laying quarters, bringing her laying flock up to 1,000 birds. These pullets weighed 4 lbs. at egg-laying maturity. G.L.F. Super Laying Mash and Super Coarse Scratch Grains are used. On the day this photo was taken (January 31), Mrs. Burns gathered 554 eggs. During the four years that G.L.F. feeds have been used, the average egg production per bird has steadily increased. For the past two seasons, the entire flock of pullets and hens has averaged close to 200 eggs per bird per year.

Left: Miss Edith Church reared 726 pullets and sold 139, housing 587 in September, where they have been laying heavily ever since. And needless to say, these pullets are eating G.L.F. Super Laying Mash. At the present time, the entire flock of 1,150 birds is laying better than 50%. January 30, Miss Church gathered 627 eggs. She is especially well pleased with the size and vigor of her pullets this year.

62^c per pullet with G.L.F. STARTING & GROWING MASH

MISS EDITH H. CHURCH, Ithaca, N.Y., has been in the poultry business several years. Until a year ago, she fed a well known closed formula commercial feed. She was dissatisfied with the price. And last year at the suggestion of her neighbor she tried G.L.F. Starting and Growing Mash, and secured the best results in her poultry-rearing experience.

Miss Church hatched 1,553 White Leghorn chicks in April and reared 1,478. She states that she never saw chicks grow as rapidly and feather as well as they did on G.L.F. Starting and Growing Mash. Broilers weighed 1½ to 2 lbs. at eight weeks of age and she received top prices for them. The labor, heat, and feed costs, less income from broilers, amounted to only 62c PER PULLET up to the time they were put in the laying houses, September 1.

The neighbor, Mrs. John R. Burns of Ithaca, hatched 1,800 White Leghorn chicks last year and grew them on G.L.F. Starting and Growing Mash. Broilers weighed 2 lbs. each at nine to ten weeks of age. Mrs. Burns has a retail market for dressed broilers and the income this past year paid the *entire feed costs* for broilers and for pullets up to laying age.

The use of G.L.F. Starting and Growing Mash has doubled each year because one poultryman has told another of the exceptional results it produces at low cost. The fact that this feed is mixed and shipped into your community by your own cooperative organization guarantees you every saving that is consistent with highest quality. This year the extremely favorable price on this feed will make chick-rearing costs even lower.

G. L. F. STARTING AND GROWING MASH

1. Is a complete feed.
2. Is mixed on approved open formula.
3. Chicks like it.
4. Is easy to feed.
5. Gives rapid growth.
6. Is unexcelled for broilers.
7. Is adapted for battery or colony brooding.
8. Is mixed fresh as shipped.
9. Mixed in your own mills.
10. Displaces a special starter—costs less.

Price

On present markets, G.L.F. Starting and Growing Mash is being delivered to G.L.F. Agent-Buyers in Syracuse Freight Zone at well under \$50.00 per ton. To this wholesale price must be added the Agent-Buyer's handling charges.

See your local G.L.F. Agent-Buyer or write to the address below.

SHRINES OF AMERICA

To George Washington

TO the hand and head that guided America's fight for independence stand shrines all over America. Quite fitting, of course, and natural. But wherever seeds of liberty and democracy, given off by America's struggle and carried by the four winds, have dropped on fertile soil, there also have sprung up shrines to George Washington. These shrines immortalize him in many countries as the champion of liberty. The greatest, the mother and father of all these shrines, however, are his monument in Washington, D. C., (left) and his old homestead at Mt. Vernon, Virginia, (below) where also stands his tomb.

SAVE FARM MONEY

WITH THE SOCONY 3

1. SOCONY GASOLINES: Banner, proved by popular vote the best gasoline in the non-premium field. Socony Special *plus* Ethyl, long acknowledged the outstanding gasoline in New York and New England. In winter we particularly recommend "Special" because it gives quickest starting even in sub-zero weather. It's brisker, *livelier!* It saves your battery. It reduces the amount of choke gasoline in your crankcase. It will not knock on the steepest of hills—IT SAVES YOU MONEY.

2. THE NEW SOCONY MOTOR OIL
—THE MOST ECONOMICAL MOTOR OIL: It is a completely dewaxed, 100% paraffine base oil

which maintains the proper body at all engine temperatures and flows freely in cold weather. It reduces wear in your engine. It saves drain on your battery. And gives perfect piston seal, maximum power, minimum gasoline and oil consumption. Proved . . . Perfected—IT SAVES YOU MONEY.

3. SOCONY WINTER GEAR OIL—
THE MOST ECONOMICAL COLD WEATHER GEAR LUBRICANT: Don't try to make a *summer* grade of lubricant in your transmission and differential do *winter* duty in gear shifting and gear lubrication. It's a costly experiment! Change to Socony Winter Gear Oil in your transmission and differential—IT SAVES YOU MONEY.

STANDARD OIL COMPANY OF NEW YORK

State Grange in Fifty-eighth Session

Officers Report Gain in Membership and Interest

By H. L. COSLINE

Associate Editor, American Agriculturist

THERE were a number of features about the 58th annual session of the State Grange at Olean which made it unusual. In the first place, the report of the Secretary and Treasurer indicated that the Grange has never been in better shape. New York State has 869 subordinate Granges with a total of 129,857 members. Steuben County tops the counties in number of Granges, having 44. Monroe County leads all counties in the average size of Granges, having 18 Granges with an average of 312 members.

H. L. COSLINE,

Chautauqua leads all counties in total members with 7,524. Jefferson County comes second with 7,088, and Monroe County third, with 6,606. An unusual feature of this session, believed to be a record, was established when all but 25 of the 772 regularly elected delegates reported the first day of the meeting.

Everybody Joined Last Fall

Another record was set which, at first thought, might seem to be a step backward. An unusually small class was initiated into the State Grange. The reason for this small class is that a special drive was made last fall, during which period several large classes were initiated in preparation for the National Grange meeting at Rochester.

National Master Taber was present and addressed the session on Tuesday evening. He pointed out that farmers get less than 38 cents of the consumer's dollar and that, while prices of farm produce have declined 35 per cent during the past several years, distribution costs have

declined only 4 per cent over the same period. In speaking of the problem of taxation, National Master Taber said the farmer constitutes 30 per cent of the nation's population. He gets but 10 per cent of the national income and pays 25 per cent of it in taxes. The other 70 per cent of the population get 90 per cent of the national income and pay 9½ per cent in taxes.

State Master Against Sales Tax

State Master Freestone also stressed the necessity for some changes in taxation. While approving of the gasoline tax because the proceeds are used to build roads, he disapproved of a general sales tax because it falls on the consumer in proportion to his needs rather than on his ability to pay.

Other speakers during the week included Maurice Burritt, Public Service Commissioner and well-known to American Agriculturist readers as a Western New York fruit grower, and as a member of the contributing staff for American Agriculturist; H. E. Babcock, manager of the G. L. F.; Dr. U. P. Hedrick, director of the New York State Agriculture Experiment Station, and James C. Farmer, lecturer of the National Grange.

Four Grangers attended the session who were at Olean for a state meeting 29 years ago. They were L. L. Allen of Watertown, State Grange Historian; Mr. and Mrs. O. W. Wixon of Elmira; and Mrs. W. W. Ware of Batavia. Another Granger in attendance was Mrs. Wesley Young of Cherry Creek, New York, a daughter of F. N. Godfrey, First Master of Olean Grange and former State Master. Mrs. Young was in-

vited to the platform and gave a word of greeting to those in attendance. Mr. Wesley Young is a prominent Chautauqua County dairy farmer and last year was selected as one of the 1929 New York State Master Farmers.

Each year, at State Grange, a silk flag is awarded to the Grange which has made the largest membership gain during the year. Last year, Midland Grange in Sullivan County won this flag but lost it this year to East Branch Grange in Delaware County which made a gain in membership of 255 per cent. Tupper Lake Grange in Franklin County made the largest actual gain in members, adding 89 to the Grange during the year.

During the past few years, there has been a remarkable growth in juvenile Granges. During the past year, 36 were organized and two were re-organized, making a total of 102 active units with a membership of 3,163.

Report of Scholarship Fund

There was much interest in the report of H. M. Stanley, secretary of the Revolving Scholarship Fund which was created 7 years ago to aid young Grangers in obtaining a college education. Loans are made to members on the basis of a maximum of \$200 for one year or \$800 for a full four years' course. Over \$21,000 have been loaned to young Grangers on this basis at an interest rate of 2 per cent during the college period, and 4 per cent following graduation until the loan is paid.

The resolutions acted upon by the State Grange are always of particular interest. Following is a partial list covering the more important ones acted upon:

A resolution, providing for inspection of fruits and vegetables brought into the State as a safe-

Soil Fertility Must Be Maintained

How Commercial Fertilizers Increase Yields and Improve Quality

By A. W. BLAIR

Soil Chemist, New Jersey Experiment Station

FORTY years ago New Jersey had almost two million acres of improved farm land and was using about 30,000 tons of commercial fertilizer. Today the improved farm land has dropped to one and one-half million acres, but we are using close to 140,000 tons of commercial fertilizer annually. During these 40 years the removal of crops, the losses due to water and wind erosion, and to the washing out of soluble plant food by rains and melting snows, have taken a heavy toll in the form of available plant food. Through education and experience the great majority of farmers have now come to understand that if this "taking away" process goes on indefinitely, without equivalent replacements, ruin ultimately awaits those who till the soil.

Already we have witnessed the abandonment of many hundreds of farms here in the East because the natural fertility had become so depleted that the land would not yield enough to support the families depending on it. Industry was calling for more labor and these marginal farmers gradually drifted into the towns and cities leaving the farms, in many cases, to grow up in grass and weeds. But New Jersey farmers have seen the handwriting on the wall and are using fertilizers liberally because they know from experience that it pays. The old adage which runs: "The proof of the pudding is in the eating of it," has its application here. Generally speaking, those who have made the greatest success out of farming are those who have been the most consistent users of

commercial fertilizers. Striking examples may easily be found among New Jersey fruit, potato, and vegetable growers. The majority of these men would no more think of omitting fertilizers than they would think of omitting cultivation of the crop.

Not only do fertilizers give increased yields but they produce crops of finer appearance and quality. Without the use of fertilizers many fruits and vegetables would fall below the standard of quality and appearance that is demanded by a discriminating and critical purchasing pop-

ulace. With keen competition from the South and the West it behooves every grower to bring to the market the very best that he can produce, and the very best can only be produced by the use of fertilizers.

But fertilizers have done still more than increase yields and improve quality and appearance. Their use has greatly stimulated the fight against the ravages of insects and disease organisms; they have brought about improved drainage conditions, a wider use of lime, and better cultural methods, because the practical farmer and the trained scientists working together realized more and more how much these unfavorable conditions limited the effectiveness of the fertilizers for which the farmer was paying hard-earned cash. When crops are destroyed by insects or disease or limited by other unfavorable conditions, the fertilizer is to a certain extent lost. Correct these conditions and the fertilizer becomes a good investment.

As a nation we have been wasteful of our natural resources, but in no way have we been more wasteful than with the land itself. Clarence Poe, editor of The Progressive Farmer, writing on this subject says: "No one looking at the farming of France can get away from the impression that just as it is a curse to a growing boy to have a fortune that he may spend recklessly, so it has been a curse to America that land has been so plentiful that the farmer has thought it no economic crime to

(Continued on Page 9)

A fertilizer distributor that will make applications to growing crops of as low as fifty pounds of a nitrogen carrier per acre.

Vol. 127 February 21, 1931 No. 8

Thought For the Week

FOR the benefit of those parents who sacrifice so much for the education of their children, and for the boys and girls themselves who work so hard for an education, it is good to know that education pays in actual dollars and cents. The College of Business Administration of Boston University recently found through a survey the following facts:

"The maximum income of the average untrained man who goes to work as a boy of fourteen is approximately \$1,700;

"A partly trained man starting to work at about eighteen reaches \$2,800 at the high point in his production;

"The well trained man whose earnings do not as a rule begin until the age of twenty-two, has by age thirty an income equal to that of a high school graduate at forty, and continues steadily to increase his income practically without a break."

Less than one percent of American men have been college graduates, but—

55 percent of our Presidents
36 percent of our Members of Congress
62 percent of our Secretaries of State
69 percent of our Supreme Court Judges
72 percent of men in "Who's Who"

came from that one percent.

Education, however, cannot be measured alone in dollars. There are those better things of the mind and spirit which result from an education, as, for example, appreciation of books, music, nature, and, best of all, of our friends.

The Trouble With Dairying

"If any one person had all the cows and was producing all the milk and then suddenly found that he had 15,000 more cans of milk than he could sell, there is no question as to what he would do. If industry were running the milk business and found that it had a surplus which it must sell at \$1.00 a can, industry would take steps to get rid of some of the cows. That is exactly what must be done in Tioga County."—PAUL SMITH.

THE above is taken from a recent address made at a dairymen's meeting in Tioga County by Mr. Smith, who is a director of the Dairymen's League. This over-production in the milk business, or rather under-consump-

tion, is not confined to New York State alone. About 40 percent more milk is now being produced in New England than is needed for fluid milk purchase. The remainder must go into cream and into butter. When one knows that butter is selling at the lowest prices in a generation, he can realize what the effect of a surplus is upon present fluid milk prices. If it were not for this surplus and if it were not for foolish competition between different groups of milk producers in both New York and New England, there is no earthly reason why fluid milk would not bring a good price.

Many farmers in several counties are co-operating to reduce the surplus by shipping out carloads of poor cows. The New York State College of Agriculture has proven that a cow must produce 8,000 pounds of milk before she begins to bring profit to her owner. The average milk production is only 5,000 and of course there are thousands of cows under this low average. A cow producing 3,000 pounds of milk in a year causes her owner a loss of at least \$90. This year there are few farmers who can stand this loss. Why not get rid of these worthless brutes even if we have practically to give them away? Good cows must be kept and fed as well as ever. The way to reduce is to eliminate the poor ones. The dairymen who learn this lesson first will be the ones to pull through the present depression on top.

New Hampshire Farmers Fight Daylight Saving

OUR New Hampshire editor, N. M. Flagg, in the New England issue this time, reports a legislative hearing on a bill for state-wide daylight saving in New Hampshire. Time and again at this hearing representatives of farm people told how daylight saving increased the costs of producing food and the inconveniences of rural life. Petitions and communications, mostly against the bill, arrived in such volume that there was a pile over a foot high of them. A market gardener told why it was impossible to work on many of the garden crops until they were dried off and of the value of late afternoon hours of sunshine during the haying season. A farmer's wife presented the problems that daylight time created for farm women.

One thing that makes us a little tired is to hear so much talk about farm relief and then have both the government and the cities stand for so many things that increase the cost of food production and make the farmer's problem difficult. We suggest that if you live in New Hampshire, that you immediately write or telegraph your representative in the legislature so that there will be no doubt in his mind as to how you feel about daylight saving.

Insurance Ruling Unfair

RECENTLY we called attention to the new ruling in the compensation law whereby farmers are made liable under this law if they do not insure their hired men when these men are engaged temporarily for the farmer in any work not directly connected with farming. As we understand the ruling, the farmer's hired man may cut wood when the wood is to be consumed on the farm, but if it is to be sold off the farm, then the farmer must insure his hired man, under the compensation law. The same principle holds for any other outside enterprise.

We have had many letters protesting against this ruling and in cooperation with others have brought it to the attention of the authorities at Albany. The result was that a hearing was held by the State Insurance Department and the premium to the farmers for logging and lumbering was reduced from \$375 to \$166. This may be of some help to small lumbermen and operators of sawmills, but the decrease is of

absolutely no value to farmers. The premium of \$166 would, in most cases, be more than all the profit the farmer would make out of his outside enterprise during the entire winter. There has not been a winter in years when farmers have needed a little extra money as they have during this one, so this new ruling is particularly unjust at this time. The premium should not only be reduced; it should be struck out entirely so far as agriculture is concerned.

New Jersey State College Needs Soils Building

NO institution or organization in New Jersey is doing more for the farmers than the State College and Experiment Station, but it has been handicapped for years by the lack of adequate buildings and laboratories. A soil science building is needed in particular.

The New Jersey State College under the fine leadership of Dr. Lipman, is outstanding in the contributions it has made in the field of soil science.

Because of this need, a request was made to the State authorities for an appropriation this year of \$350,000. Governor Larson in his message cut this recommendation to \$150,000. We hope the amount recommended by the Governor will not only be passed but increased, so that it will be adequate for the construction of a satisfactory building.

A Definite Way to Save School Taxes

IN our February 7th issue, we called attention to the increased pay which supervisors get since the creation of so many central rural school districts, because of the law which gives them one percent of the State aid school moneys which they handle.

Assemblyman Irving Rice, Chairman of the Committee on Education in the New York State Assembly, has introduced a bill, No. 605, which would cause the State to pay this money direct to the county treasurer who will, in turn, pay it directly to the treasurer of each union free school district and each central school district situated within his county. It is estimated that State aid to union free schools is approximately \$11,785,000. State aid to central rural school districts is approximately \$1,942,000. Therefore, the total State aid to these two classes of districts amounts to \$13,727,000. Of this sum the supervisors now collect one percent, which amounts to \$137,277, a tidy sum worth saving to the taxpayers of the State, and it would be saved if Mr. Rice's bill is passed. Moreover, it is a direct saving to local taxpayers, because the one percent is a direct charge against the local district.

Many supervisors are public spirited enough to approve this bill which will result in the saving of public money. There is, however, as might be expected, some opposition. Therefore, we suggest that you write immediately to Mr. Irving Rice, Assembly Chamber, Albany, New York, in support of this bill.

Eastman's Chestnut

UNRULY hens in villages cause just about as much trouble as unruly cattle on farms. Here is the way one man handled the situation.

One morning Brown looked over his garden wall and said to his neighbor:

"Look here, what are you burying in that hole?"

"Oh," he said, "I'm just replanting some of my seeds, that's all."

"Seeds!" shouted Brown angrily. "It looks more like one of my hens."

"It is. The seeds are inside."

With Our A.A. Boys and Girls

WENDALL WICKS of Oxbow, New York, has been a 4-H Club member for eight years. He has a long list of winnings with his Ayrshire animals and has traveled with them to the National Dairy Show several times. Recently he broadcast his experiences from radio station at St. Lawrence University. After he had given some of his experiences and told of some of the prizes he had won, Wendall said:

I do not wish to give the impression that winning prizes and traveling is all we get out of club work. The 4H Club provides for social and recreational development through the organized club.

Wendall Wicks and a prize winning heifer

Local 4H Clubs are organized on a school district or community basis with a local leader. At our meetings we learn fundamentals of parliamentary practice. By assisting our leader we learn to become leaders ourselves.

Each 4H Club member must keep an accurate record of expenses and receipts on his project. Thus, the 4H Club member increases his knowledge of business and thrift. Many of the projects afford opportunities for economic gain. I know of hundreds of 4H Club boys in this state who own one or more calves. I have in mind two brothers who own twenty-eight head of purebred Guernseys. I have twelve head of purebred Ayrshires. When I started in club work there were four purebreds in our herd; now, through the encouragement of a 4H Club, we have thirty-five head, all purebreds.

I believe this nation must look to the 4H Club member, the farmer of tomorrow, for continuous prosperity. We must have an intelligent and prosperous rural population if this country is to maintain its high standards.

The A. A. Letter Box

Dear Friends:

How are you? I am fine. I am just a newcomer and am writing because I have been reading the letters other boys and girls send in. I am fond of moving pictures and pets. I would like boys and girls to write to me. Tell me how to join the Boys' Club and I would like

to join. My father's name is Edward Dole and he gets the A. A. magazine. I have a pet cat and its name is Tommy Tiger. He is very playful and always follows me around. That is all I can say now. I am eleven years old.—DENIS DOLE, North Collins, N. Y.

* * *

I would like to write to an A.A. boy or girl. I am sixteen and my hobbies are sports and scouting.—ELIZABETH CHAPMAN, 927 Paulding St., Peekskill, N. Y.

EDITOR'S NOTE—Will some of our A. A. boys and girls write to Denis and Elizabeth. If others would like to get letters write to us and we will print it next month.

Scouting for Rural Boys and Men

By COLIN H. LIVINGSTONE
Honorary President, B. S. A.

KNOWLEDGE, wisdom, economy, thrift, diligence, cooperation, carefulness, prudence, and self reliance are the fundamental characteristics of the American farmer and his sons. With these as the bases of growth and development there is no limit to the advancement of the rural boys to whom opportunity comes for the great tasks of life beyond the environments of the farm.

One of the opportunities offered today to rural boys is the program of the "Boy Scouts" now made available to the farm boys of the land. The Scout plan is to broaden and intensify a boy's knowledge by a comprehensive program suited to every boy everywhere, Scouts in organized Troops, Patrols, as well as the Lone Scout Plan of Scouting. The Lone Scout, by joining this great brotherhood of boys, becomes a pal of all Scouts everywhere and has the advantage of the great leadership which has been developed for all Boy Scouts and men in Scouting.

Some time ago I met a farm boy about thirteen years of age in Virginia who was doing a very kind act by carrying a heavy package from an electric car to a buggy for an elderly woman. When he had finished his self-imposed task I said "You are a good Scout." He answered, "I am not a Scout yet." I said, "Well, you are playing the Scout game." He answered, "I picked up a Scout book somebody had lost on the road and have read a lot of things in it and I thought I would just try the game for the fun of it. That's why I carried the bag." I said, "Have you done many kind turns?" He answered, yes, a whole lot. I said, "Is it fun?" He said, "It's more than fun now. I hunt for things to do and father and mother want me to join the Scouts".

Scouting practice is an armour worn by boys that protects them from countless temptations and creates in them imperceptibly the longing for greater

opportunities. To all Scouts these opportunities are bound to come. He who seeks shall find. A boy Scout is always "seeking." Seeking new knowledge of every kind, new puzzles, new tests, new stunts. His ambition to advance himself becomes second nature. Some one gets to know his qualities and wants him for a position that is vacant. He is chosen. Before him a world of opportunity is open. He has trained himself through the practice of the Boy Scout program to tackle the task, no matter how tough. His future becomes a drama of pleasure. Unselfish in his helpfulness, every one cooperates with him. Still greater opportunities of advancement and prosperity lie in his path. Scouting is the golden gate to a great future whose rewards have no limit.

A Cheerful Letter

I HAVE enjoyed your paper very much. I wish I could make your readers feel the spirit 4-H Club folk have and realize how much in earnest we really are.

Agriculture has been on the front pages more or less for some time, and every one is wondering just how and when conditions will change. The pres-

Mary H. Morton

ent situation is discouraging, but that's where the 4-H folk speak up. Are they discouraged? 4-H'ers aren't quitters!

At the Iowa State 4-H Boys' Convention last month, 83 per cent of the boys expressed a desire to stay on the farm. Does that sound discouraging? They believe in organized Agriculture, but they believe in intelligent individual farmers as good Farm Relief. The good old days when Uncle Jake farmed because he didn't know enough to do anything else, are over. Club boys realize they must make use of the things they have learned—crops, soils, livestock and grain judging, and the best methods and practices adaptable to their communities.

The girls are just as eager to help make rural conditions better. They want a part in improving rural conditions. With real homemakers with 4-H training, you may be sure that the rising generation of farm folk is rising.

They are grateful for what you older people have done, and so, cheer up! They are learning to help themselves, and as long as rural youth of America has the 4-H spirit, you can put your trust in them.—MARY H. MORTON, Sec'y and Treas. Iowa State 4-H Clubs.

Boy Scouts Save Lives

IN a report made to Scout Executive James Killough of Albany, N. Y., two Boy Scouts are credited with having saved the lives of twin brothers when fire destroyed the home of the latter at Voorheesville, N. Y. The Scouts, Stuart McLaury and Delosse Gainsley, both of Troop No. 73 of Voorheesville, went with others to the fire when the alarm was first sounded, according to the report of their Scoutmaster C. A. Bouton. The boys arrived before the firemen. They knew of the children being within

the burning building. Despite the fact that the structure was in flames the boys decided to attempt the rescue though an effort was made to dissuade them by a spectator who believed that it would be fruitless and that the children within the burning building had already perished. The boys, however, persisted, and brought out the children, just as the firemen arrived.

* * *

Simon N. Sterns, a 13-year old Boy Scout of Troop No. 101 of Demarest, N. J., through his foresight and quick action, recently saved a man from death. F. L. Geleman was working beneath his automobile adjusting the springs when the car slipped from the jack and pinned him to the ground, leaving Geleman's head only protruding.

Scout Sterns, happening along, quickly realized the danger and immediately rounded up his father and others by whose united strength the car was lifted sufficiently to release Geleman. A physician, immediately called, stated Geleman would not have lived another minute if the car had not been removed.

Try These On Each Other

(Answer Any Ten)

1. Who discovered America, and when?
2. From what country did the United States get its independence?
3. What gallant settler spread his coat on the ground for a Queen to tread upon?
4. What man made a famous ride during Revolutionary days? From where to where?
5. Who was the "Father of our country"?
6. In what city did he first take office as President?
7. Who now lives in the White House?
8. Who was President when slaves were set free?
9. Who was the most famous Northern General in the Civil War? The most famous Southern General?
10. Who was Commander-in-Chief of our army in the recent World War?
11. Name the present governors of New York, New Jersey and Pennsylvania.

(Answers will be found on Page 6)

Which is heavier, a pound of gold or a pound of sugar?

Answer: A pound of sugar, because gold is weighed by troy weight in which there are 12 ounces to the pound. Sugar is weighed by avoirdupois weight with 16 ounces to the pound.

This picture was sent us by H. L. Brown of Waterport, Orleans County, who says that his little granddaughter, who is pictured with some of her pets, has a baby brother whose parents propose to make the farm so attractive that he cannot afford to leave farming. This little girl is the sixth generation on the old farm since 1804.

The Solution

Their Future Is Secure . .

THE family whose farm carries a Federal Land Bank mortgage faces the future with confidence. These folks know that so long as the semi-annual installments are met and the farm is maintained in good condition, the loan never will be called. They know that their installments, which include interest and a small amount on the loans, will discharge their debt in 20 or 30 odd years. Over 410,000 farm families now enjoy the security of Federal Land Bank mortgages. Such loans are back of

FEDERAL LAND BANK BONDS

—a safe and tax-free investment. These Bonds can be purchased in denominations of \$40, \$100 and upward. Interest is paid twice yearly.

Ringling Apple Trees

Is there any real evidence to show that ringling of apple trees tends to bring them into bearing? Is there any danger of injury from this practice?—S. T., New York.

If trees are vigorous in their growth, ringling, consisting of the removal of a narrow ring of bark, does not seem to injure them and may result in stimulating growth. However, this should not be done if trees are not vigorous. The theory back of the practice is that this ringling keeps the carbohydrates in the top of the tree and prevents their passing down into the roots.

Where practiced, ringling should be done early in the season before the fruit buds are formed. We do not find that experiment stations comment on the practice of ringling with much enthusiasm.

Acidity in Orchard Soils

Is there any danger that the sulphur in a lime sulphur spray will get through the soil in sufficient quantities to make the soil acid in orchards?

THERE is undoubtedly some action along this line but we do not know that anyone has worked on the problem long enough to know just how serious a problem it may be. It is true that it takes from 2 to 3 pounds of lime to neutralize the acidity which might come from a pound of sulphur. It is our understanding that the experiments up to date have not shown much benefit from the use of lime in orchards.

Controlling Raspberry Diseases

THE Pennsylvania State College of Agriculture at State College, Pennsylvania, recently published circular No. 133 on "Raspberry Disease Control." The following is a brief summary of the principal points in the bulletin: Plant only plants that are as disease-free as it is possible to obtain.

Black raspberries should be sprayed with lime sulphur every year for the control of anthracnose and other fungous diseases. Spray other brambles as needed. Full directions are given in the bulletin.

Examine your berry patches at least three times during the growing season for plants infected with mosaics, leaf curls, and streak.

Scorch all diseased plants with a blow torch before pulling them out. This will kill all aphids or plant lice that otherwise would be shaken off the diseased plants in the process of pulling out and removing.

Pull and burn all plants affected with such diseases as mosaics, leaf curl, and orange rust. Young shoots from infected red raspberry roots are always themselves diseased so in pulling out diseased plants be sure and remove all the roots.

Plant red, black, or purple cane varieties at least 1,000 feet from each other. Mosaic, transferred from reds to purple cane or black varieties, becomes very virulent.

Locate the berry patch 1,000 feet or more from wild brambles as virus diseases live on wild berry plants and act as sources of infection.

Carefully select the site of your berry patch so that an orchard, a grove (Continued on Opposite Page)

of trees, or a hill may serve as an effective screen to aphids from diseased to healthy berry patches. Remember also that rain and wind are very effective means for transferring aphids from diseased to healthy berry patches. Aphids have been carried over one-half mile in this manner.

Always remove the "handles" from young plants before planting. The "handles" usually are infected with anthracnose.

Keep the berry patch free of weeds. They help to keep the air moist around berry plants, thus producing a condition favorable for infection by fungus spores.

This bulletin may be secured free of cost by writing to the Pennsylvania State College of Agriculture.

Spray Injury to Roots

Is there any evidence that spray materials may get into the soil and injure the roots of growing trees?

WE do not know that this subject has been sufficiently studied to enable us to give a definite answer. It certainly seems probable that certain combinations of arsenic would prove very injurious to roots if it came into direct contact with them in a soluble form. However, there are certain features which are likely to minimize this action. In the first place, organic matter in the soil is likely to absorb any injurious substances. The roots of apple trees of course, do not come as close to the surface as do the roots of most cultivated crops. The presence of lime is also considered to be a protective element so far as injury from other substances is concerned. The possibility of such damage is a good reason for keeping up the organic supply in orchard soil.

Super Spraying

Several times recently we have read or heard the term "super spraying". Just what is usually understood to be the meaning of this term?

THIS term has been used to mean a more thorough, more efficient spray program and a more thorough application of the spray. Some orchardists are using as much as ten gallons of spray for a twenty-five year old tree. Then too, super spraying requires more time and this has been given as an objection because it makes it impossible to get over the entire orchard as rapidly as might be desired.

Everyone recognizes the importance of timeliness in application, but this objection has been met to a considerable extent by improved equipment which makes it possible to speed up the spraying. Many old spray rigs will not satisfactorily handle a spray gun because the pressure drops to too low a point. This results in a coarse spray which does not cover the trees thoroughly. Briefly then, the term "super spraying" means more spray put on more carefully and at high pressure by the use of efficient equipment.

State Grange in Fifty-Eighth Session

(Continued from Page 3)

guard against the introduction of insect pests and plant diseases, received favorable action after amendment by the Committee on Agriculture providing that the inspection should be under the State Department of Agriculture and Markets. Other resolutions which received favorable action included one in favor of a proposal that the State Department of Agriculture and Markets establish regional markets; one favoring the Miller bill to reduce to \$5 the license fee on trucks owned and used on farms; one approving a bill before the Assembly providing for a three-quarter year motor vehicle license for farmers who do not use their machines before April 1; and one favoring an amendment of the Vehicle and Traffic Law making it possible for traffic officers to arrest a violator without a warrant. Another resolution protested against abolishing one year Teachers' Training Classes.

It is interesting to note that farmers are independent thinkers and refused to approve some of the resolutions recom-

mended by the committees which reported them. For example, a resolution was reported favorably recommending a change in the tax unit from town to county. This was voted down on the ground that tax collection by the county would be more expensive than under the present town system. There was quite a sentiment in favor of it and later a vote was taken to re-consider the resolution, but the vote failed to pass. The delegates also voted down a resolution asking the appointment of a temporary commission to investigate the matter of compensation similar to workmen's compensation to be paid to persons injured in automobile accidents. Apparently, this failed to gain approval because of the probable expense.

Another resolution opposed a bill introduced by Senator Kirkland and Assemblyman Smith to make it possible to merge two or more county fairs. The committee reported unfavorably on the resolution and their action was sustained by the delegates on the theory that the bill did not require the merging of fairs but only made it possible for them to do so in case they so wished.

The Grange also went on record as strongly favoring the adequate enforcement of the Prohibition Amendment and as disapproving the use of oleomargarine as a butter substitute either in public institutions or private homes.

It seems that some question has been raised as to whether or not Olean had the facilities for entertaining a session of this size. After the four-day meeting was over, those attending were unanimous in their approval of the way they had been taken care of. Several

hundred delegates who arrived at Olean late in the evening were assigned to rooms by the Housing Committee and were guided to their rooms by a delegation of Boy Scouts.

During Friday's session, Edward F. Devlin, chairman of the Local Committee on Arrangements, E. W. Fitzgerald, secretary, and Mark J. Hannan, treasurer, were invited to the platform to receive the thanks of the delegates. Along with them were a number of Boy Scouts representing those who had so efficiently guided the incoming delegates. The Scouts were introduced to the meeting and gave, in unison, the Scout oath.

Japanese Beetle Gains Ground, But Slowly

FOURTEEN years after the Japanese beetle was first discovered in the United States near Riverton, N. J., the most remote point at which the insect has established itself is at New Castle, Pa., an air-line distance of 285 miles from the site of the original infestation. Beetle scouts from the United States Department of Agriculture this summer searched for the pest in 16 States, including Ohio, North and South Carolina, and Georgia.

Other isolated infestations at considerable distances from the beetles' starting point are those at Boston, Mass., Buffalo, N. Y., Pittsburgh, Pa., and Norfolk, Va. In the 14 years the beetle has been known in this country it has spread at the rate of but 20 miles a year.

Plenty of nitrogen makes profitable crops

Nitrogen makes plants grow—produces the fancy vegetables that bring the fancy prices on the early market. Use plenty of it in your mixed fertilizer at planting time and side-dress with Arcadian Sulphate of Ammonia when the growing plants begin to feed heavily.

Mr. A. Morris Todd of Sparrows Point, Md., is only one of hundreds of truck growers who increased their yields with Arcadian. He side-dressed his spinach crop with Arcadian Sul-

phate of Ammonia. The result was a gain of 652 baskets per acre representing a net profit of \$160 over and above the cost of the side-dressing.

Arcadian Sulphate of Ammonia contains a guaranteed 20.56% nitrogen content—all quickly available. It is easily applied and can be obtained in moisture-resistant bags of 100 lbs. for convenience; 200 lbs. for economy.

Order Arcadian Sulphate from your fertilizer dealer when you get your mixed goods.

**Royster FOR TOMATOES**

"... got 634 baskets to the acre and figure Royster's responsible for 158 baskets and better quality." H. M. Case, Magnolia, Del.

**Royster FOR ONIONS**

"from time of application to harvesting of crop, Royster's is superior to any I have used for over ten years."

Henry Benthin, Elba, N. Y.

Royster

—for truck crops

Two New Jersey farmers say "excellent"

After gathering 550 bushels per acre of fine radishes from his Royster-fertilized farm at Sicklertown, N. J., Nick Capasso planted Bountiful Beans, without any further fertilizing. And got a 500-bushel per acre yield on the bean crop! "Have used Royster's exclusively for 11 years and always find them excellent producers."

From Burlington, N. J., C. W. Cliver writes: "I used 1,000 lbs. per acre of Royster's 5-8-7 on Lima Beans and got 191 bushels per acre, which I consider an excellent yield. I'm convinced that Royster is of a superior quality ... expect to use it exclusively next season."

For all crops and all types of soil—in favorable or unfavorable weather—Royster fertilizer has stood the test of nearly 50 years. Made of the best materials, Royster comes to you in excellent mechanical condition—and in full-weight bags. Try this good, reliable plant food!

Growing Early Cabbage Plants

What are the essentials for growing good, early cabbage plants at home?

THE following directions for growing early cabbage plants are taken from Extension Bulletin No. 148 on Growing Early Cabbage, published by the Connecticut Agricultural College:

"Good plants can be home raised. For the greatest success a greenhouse is necessary although a hotbed may do. Especially prepared soil is needed. A good type is composed of one-third loam, one-third rotted horse manure and one-third sand, preferably composted one year. Place this soil in flats or on the planthouse bench, about the middle of February.

Prepare Hotbed Ahead of Time

Start heating the planthouse or have the hotbed ready a few days ahead. Mark out furrows spaced 1½ inches to 2 inches apart and ¼ inch deep in this fine, level, rich soil. Strew seeds thickly along furrow. Cover seed with soil or better still with sand. Level and press the soil down evenly with a brick or board. Apply water. Cover with burlap or newspaper to help quick germination. Each day if soil seems to be dry, add lukewarm water. If heat is maintained at 60 degrees to 70 degrees Fahrenheit, the sprouts will soon show.

When they show or lift the covering, remove the burlap or paper and allow them to grow naturally. Transplanting starts as soon as the operator can handle the small plants, usually when the first leaves are about the size of a dime. A flat 12x18 inches in size with seedling rows 1½ inches to 2 inches apart, seed sown thickly, should give 1,000 to 1,500 seedlings. Fill the flats with the specially prepared soil, level or strike off, mark out 1x1½ inch spaces or holes place the roots of the small seedlings in the openings, press the soil against the roots. When the flats are completely transplanted, place them under a bench for a day or two or cover them with newspaper. This enables the small seedlings to regain balance, that is, start growing again. In a flat 12 inches wide by 18 inches long and 2½ inches deep 104 to 108 good seedlings can be grown. More space means larger, stockier better plants. As an aid against damping off, apply sharp sand over flats until the soil is covered one-fourth inch deep. Lift the seedling tops if covered with sand.

Add Water in the Morning

Care in daily watering, ventilation and temperature control will help the plants to grow fast and correctly. Water with a nozzle, only as needed and in the morning from 9 to 10 o'clock on bright days. The temperature needed is 65 to 75 degrees Fahrenheit. Give plenty of fresh air even if it is necessary to force the fire somewhat.

By March 15 to 20 commence hardening-off the seedlings. If they are in flats remove them to a cold house or cold frames. They will then be subjected to lower temperatures and less watering and slower, harder, firmer growth will result. As April approaches remove the sash or open the vents wide. Do everything possible to have the plants accustomed to outside conditions. Even

Name

Address

removing the flats in late March or early April to the outside will help. Protection is necessary on unusually cold nights. Cover them with mats or cloth or return them to the frames of the plant house. Good sturdy six to eight inch plants with a purplish tinge should be ready for outside planting in the field or garden on or about April 5 to 10.

Red Clover Seed

THE New Jersey Experiment Station reports on the results secured from domestic red clover as compared with seed from foreign sources. The four strains grown in this country seeded in the spring of 1928, had an average stand one year later of 89 per cent whereas the five plots seeded with red clover from foreign countries had an average stand of only 37 per cent. Seed from foreign countries came from Russia, Poland, Hungary, Ukraine and France. This seed came into this country with 1% of the seed stained green.

Purchasers of seed may be assured of getting seed from this country if they buy stock which has not been stained. Still better, they can buy what is known as "verified origin seed" and in this way know not only that it comes from this country, but that it comes from a state where the winters are at least as severe as they are in this section.

Fertilizer for Cabbage

What is usually recommended in the way of fertilizer for the cabbage crop?

WHERE farm manure is available some growers will get good results by using farm manure, supplemented by superphosphate. For a complete fertilizer, a 4-12-4 or a 4-16-4 may be used where a relatively light application is needed, or a 5-10-5 or 5-8-7 where more plant food is required. If a more concentrated fertilizer with the same ratio is used, the amount of application can be cut proportionately.

Soil Fertility Must Be Maintained

(Continued from Page 3)

lay waste one acre and then clear up another to take its place." But we have now laid waste to the very borders of a great and new country and there is no longer the new acre to take the place of the abandoned one. We must go back and build up the waste places. Millions of tons of valuable plant food have gone out into the ocean or been buried in mud flats along our great rivers or shipped to other countries in the form of exported grain and feeding materials. A vast part of this loss can never be recovered. Commercial fertilizers must play a very large part in making good this loss.

In our struggle to maintain the fertility of the soil we can gain many lessons from some of the old world countries where the land has been under cultivation for many centuries. Statistics show that notwithstanding this fact they can produce much larger average yields per acre than we in America can produce. Their land has been subjected to very much the same destructive agencies as has ours. How then have they maintained fertility? We must find the answer largely in their use of fertilizers.

In Holland the average consumption of fertilizers per acre under cultivation is 530 pounds; in Germany it is 337 pounds and in the United States it is only 35 pounds. Both Germany and Holland use approximately four times as much nitrogen per million of population as the United States. For the period 1923 to 1927 Germany's average yield of potatoes was 190.7 bushels per acre. The average yield for the United States in 1927 was 113 bushels. During the period 1923 to 1927 Germany's average yield of wheat was 27.2 bushels per acre and the 1927 average for the United States was 15 bushels.

Surely these countries have shown that there is a very close connection between good farming and a generous use of fertilizers. Does someone say that fertilizers are too expensive to use? The answer is that they are relatively cheaper today than in 1913.

How to DOUBLE the "Size" of your PASTURES

MULTIPLY by two the live stock you can graze per acre and it's better than doubling the acreage of your pasture land, because it involves no extra land investment.

Sounds crazy...but it's not. It is a straight business proposition—easy and not expensive. Fertilize your pastures with Chilean Nitrate of Soda. Chilean produces more grass and increases the amount of digestible protein. Promotes faster growth and deeper roots. Helps grass resist drought. Doubles the carrying capacity of the land. It's a practical proven way to reduce your cost of milk production. More farmers are learning this every year.

NEW BAG: LOWEST PRICE

Now Chilean is delivered to you in new 100 lb. bags. Contents and bag both reach you in better condition. Easier to handle...it's the bag without a backache. And the price this year is low.

Chilean is supplied in two forms—Original Chilean (crystallized) and Champion brand (granulated).

Now is the time to buy! Specify "Chilean"—the natural nitrate fertilizer—when you order your nitrate. That one word "Chilean" is your protection and your dealer's too...the biggest thing to remember in buying fertilizer.

Special information covering pasture fertilization will be sent on request.

New York Dairymen Awarded Honor Roll Diplomas

EDITOR'S NOTE—Last week we published the names of New York State dairymen who were awarded honor roll diplomas by the National Dairy Association. The following are additional names of these dairymen whose herds, either in Dairy Improvement Associations or herd tests, produced better than 300 pounds of butterfat per cow for the year.

Rensselaer County

John Bates, Melrose
O. A. Borden, Schaghticoke
C. A. Breese, Hoosick Falls
John DeLee, Troy
Finch Brothers, Castleton-on-the-Hudson
C. W. Halliday, North Chatham
Chas. Henry, Nassau
Geo. Hoyt, Castleton-on-the-Hudson
F. B. Kimmey, Greenbush
G. P. Latimer, Schaghticoke
Henry Legal, East Schodack
Dr. G. R. Little, Schaghticoke
C. L. Middlebrooke, Nassau
I. G. Payne, East Schodack
J. F. Pratt, Schaghticoke
Taylor Brothers, Johnsville
Troy Orphan Asylum, Troy

Your HERD was One Big Cow!

One mouth to feed—One cow to milk—How Simple!

But the dairy business is not built that way. You can't treat your entire herd as one big unit. **Each cow must be handled as a separate individual**—she must be fed according to her milk production and required to stand on her own in so far as profit is concerned. In almost every herd there are some cows that are not producing at a profit—these cows are costing their owners money. **They require the same time and labor as good cows and are only helping to create a surplus of milk on the market.**

Under present conditions it is important that every non-profit cow be eliminated. The best way in the world to get rid of surplus milk is to weed out those low producing cows. After that is done then **feed your good cows the best ration you can buy.**

Regardless of milk prices, **a good cow will produce more profit on Larro than she will on any other ration.** Larro plays square with the cows at each feeding because **it is always the same—always uniform.**

It's no child's play—this dairy business, but with good cows and Larro in the barn it is surprisingly more simple and a lot more profitable.

See your Larro dealer today and start feeding for greater profit

YOUR HANDS

can never duplicate a Calf in Milking

The calf (the world's only perfect milker) gets his food from the cow by low-vacuum suction and upward massaging of the teat with the tongue. Nature did not intend that the milk should be squeezed out by hand force. Hand milking is not natural, because it does not follow Nature's plan. It is costly because it requires a great deal of time and labor. It is unsanitary because milk in an open pail cannot be kept absolutely clean.

But - the milk in an open pail cannot be kept absolutely clean.

Universal natural milker does!

Our 24-page Free Catalog tells the whole story. Send for your copy today.

NEW IDEA Farm Equipment

NEW IDEA Spreader famous for its Quality

If your farm needs lime, be sure to inspect the remarkably simple and efficient NEW IDEA Lime Spreading attachment.

THIRTY-ONE years ago NEW IDEA brought out the first wide-spreading spreader. Many engineering improvements lie between that original invention and the present perfected model. But every NEW IDEA Spreader from first to last, has been alike in one respect. The *quality* of materials, workmanship and design has always been *the best that could be produced*. Quality leadership is a NEW IDEA habit. Take another look at the famous Model 8 next time you are near a dealer.

A Transplanter of the Most Modern Design

TRANSPLANT the NEW IDEA way. Greater simplicity of operation, increased comfort for driver and plant setters—and the finest planting results ever obtained—these are a few of the advantages

offered by this strictly modern machine. Handles ALL transplantable crops and root settings. Plants flat, in ridges or for cross cultivation. A machine of the widest utility. Recommended by farmers, truck growers, nurserymen and florists.

See your NEW IDEA dealer or write us direct for information about any machine in our line.

THE NEW IDEA SPREADER CO.

Manufacturers of Spreaders, Corn Pickers, Transplanters, Husker-Shredders, All-Steel Harvest Wagons, Lime Spreaders, Portable and Bucket Elevators, Hand and Power Corn Shellers, Hay Loaders, Side Delivery Rakes, Gasoline Engines.

CRAINE, INC.

41 Wilson Street,

Norwich, N. Y.

And HE JUMPED OVER THE Moon!

MORE than twenty-five years ago a dairyman fed his cows Dried Beet Pulp for the first time and was amazed at the results. Immediately milk flow increased—soon his cows were in perfect condition, bright-eyed, sleek-coated—and his profits jumped to a new high level.

Today dairymen get the same fine results. And with the present extremely low price it brings a new opportunity for increased dairy profits. IF HAY IS HIGH PRICED, REPLACE IT WITH DRIED MOLASSES BEET PULP. SIX POUNDS OF BEET PULP WILL DO THE WORK OF TEN POUNDS OF HAY AND DO IT BETTER! Feed it in place of corn, silage and other carbohydrates. It's bulky, cooling, palatable and laxative—it fits any ration and is good for all animals.

If your feed dealer doesn't have Dried Molasses Beet Pulp he will get it for you. Shipments made direct from factory nearest to buyer.

Reviewing the Latest Eastern Markets

Milk Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream	1.66	1.50
2A Fluid Cream		
2B Cond. Milk	1.91	
Soft Cheese		
3 Evap. Cond. Milk Powder		
Hard Cheese	1.55	1.50
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for February 1929 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

January Prices Announced

The Dairymen's League announces the following pool prices for January for 3.5% milk.

Gross	\$2.14
Expenses	.06
Net Pool	2.08
Certificates of Indebtedness	.10
Net Cash Price to Farmers	1.98

	Net Cash	Net Pool
January 1930	2.62	2.47
January 1929	2.91	3.01
January 1928	2.80	2.90
January 1927	2.57	2.67

The Sheffield Producers announce the January cash price to producers for 3% milk in the 201-210 mile zone, as \$2.04 1/2 per hundred, (\$2.24 1/2 for 3.5% milk).

	3%	3.5%
January 1930	2.64	2.84
January 1929	2.84	3.04
January 1928	2.85	3.05
January 1927	2.64	2.84

Butter Continues to Fluctuate

CREAMERY SALTED	Feb. 14, 1931	Feb. 7, 1931	Feb. 15, 1930
Higher than extra	29	29 1/2	27 1/2-28
Extra (92 so.)	28 1/2	27	27
84-91 score	24 1/2-28 1/4	23 1/2-26 1/2	32
Lower Grades	23 1/2-24	22 1/2-23	30

The week ending February 14 was another of almost constant fluctuation in the butter market. Last week we reported a new low point when creamery extras dropped to 27c. This caused sharp cuts in retail values on the part of the leading chain stores which resulted in a broader call for supplies to take care of the increased trade needs. This, together with a general expansion of buying interest in the jobbing trade cleaned up the market and on February 9 trade opened with advancing prices. The demand continued good on Tuesday. On Wednesday a reaction set in that caused values to drift backward. Thursday was a holiday and Friday found the market experiencing another good call from the buying trade. This absorbed Wednesday's loss and the market closes firm.

The outlook is still very uncertain and there is nothing that would indicate a definite trend of sentiment. Receipts are holding up well and everything indicates that the make will be maintained. Of late, the movement into distribution has been very satisfactory. The chain stores have been putting out fancy butter at 31c to 33c with some specials even at a lower figure. This is cutting into the available supply and if it keeps up it will have a very beneficial effect. The use of held butter is a little broader than it was, and the out of storage movement is running ahead of the same period for last year.

On February 13, the four cities reported storage stocks totaling 17,601,561 pounds compared to 20,704,112 pounds for the same day a year ago. From February 6 to 13 the out of storage movement totaled 1,935,865 pounds as compared with an out of storage movement a year ago during the same period totaling 1,744,841 pounds.

Weaker Trend to Cheese

STATE FLATS	Feb. 14, 1931	Feb. 7, 1931	Feb. 15, 1930
Fresh Fancy	17	18	18-18 1/2
Fresh Average			
Held Fancy	21 1/2-22 1/2	21 1/2-22 1/2	24-25
Held Average			23-

Everything points to a weaker trend in the cheese market as the market comes to a close on February 14. Western prices on fresh cheese, it is expected, will weaken slightly as production increases. Production is expected to increase following a swing to cheese manufacturing due to the relatively low prices prevailing for butter. Cheese is very close to

the price level of a year ago, whereas butter has suffered severely.

Very little fresh cheese is coming to New York, which is fortunate, as very little is wanted. A few fresh States are arriving but they are not moving well, even when offered at lower prices.

On February 11, the ten cities making daily reports had in storage 12,218,000 pounds of cheese compared to 14,430,000 pounds on the same day a year ago. From February 4 to 11, the out of storage movement was in excess of that during the same period a year ago. On February 1 the U. S. storage stocks totaled 54,511,000 pounds compared with 53,672,000 pounds on the same day a year ago. From January 1 to February 1 U. S. storage holdings were reduced 8,815,000 pounds compared to a reduction of 9,806,000 pounds during the same period a year ago.

Eggs Again Lower

NEARBY WHITE	Feb. 14, 1931	Feb. 7, 1931	Feb. 15, 1930
Hennery			
Selected Extras	23	24 1/2	23
Average Extras	21 1/2-22	22	22 1/2
Extra Firsts	20	21	20 1/2-21
Firsts	19	19 1/2	20

NEARBY BROWNS	Feb. 14, 1931	Feb. 7, 1931	Feb. 15, 1930
Hennery			
Gathered	17 1/2-19 1/2	18 1/2-20 1/2	49-

The egg market continues to be a most discouraging proposition. Even the most pessimistic never expected to experience such a disastrous break in prices. Heavy receipts have been responsible for much of the grief. At the same time most of the trade shows no inclination to store the surplus. There has been some light speculative demand that has taken on some fresh mixed colored eggs but these have been stored in the face of a large reserve of the 1930 pack still to be marketed. There is no question but that it takes a lot of courage for a man to bet on the future when the cards lie as they do.

On February 1 U. S. storage stocks totaled 734,000 cases compared with 139,000 cases on the same day a year ago. From January 1 to February 1 storage stocks were reduced 1,160,000 cases compared with a reduction during the same period last year of 565,000 cases. This indicates quite clearly that if the retail trade will play ball heavy stocks can be moved.

The frozen egg market offers a problem. On February 1, U. S. storage stocks of frozen eggs totaled 75,378,000 pounds compared with holdings on the same day a year ago totaling 44,080,000 pounds. From January 1 to February 1, holdings of frozen eggs were reduced 7,806,000 pounds, compared with a reduction during the same period a year ago of 9,464,000 pounds.

An item of note comes from the Pacific Coast to the effect that the surplus of Pacific Coast white eggs is being stored rather than cut prices further. Furthermore, the shipments of storage packings from the Coast during the third week in February are expected to be higher priced than the week previous.

Live Poultry Market in Better Shape

FOWLS	Feb. 14, 1931	Feb. 7, 1931	Feb. 15, 1930
Colored	-22	20-22	27-28
Leghorn	20-21	17-19	23-25
CHICKENS			
Colored	24-28	23-28	24-28
Leghorn	21-22	21-22	22-24
BROILERS			
Colored	37-42	25-38	25-36
Leghorn	30-39	32-35	28-33
OLD ROOSTERS	15-16	15-16	-19
CAPONS	37-40	37-40	35-38
TURKEYS	30-40	30-40	25-35
DUCKS, Nearby	25-28	25-26	25-27
GESE	19-21	-19	20-23

During the week ending February 14 the live poultry market was in much better shape than of late. Leghorn fowls have been in the favor of the seller and fancy stock has brought a premium. Even colored fowls have been selling better but these have been at the freight market level. It has been almost impossible to establish wholesale values on chickens and pullets in the express market due to their scarcity. Broilers have been selling very well and toward the close of the week were

trending upward, although just as the market came to a close supplies were not clearing as satisfactory. Late shipments were timed poorly. Hen turkeys are a little higher while old toms stay at 30c.

Bean Market Quiet

The bean market is exceedingly quiet and the general tone is weak. Demand as a whole has been very limited. Even the most favored lines are feeling the sluggishness. Marrows have been bringing \$4.75 to \$5.25 for average with Jumbos at \$5.25 to \$6.25. Pea beans range from \$4.75 to \$5.25; Red Kidneys \$9 to \$9.75; White Kidneys \$7 to \$7.50; Round Cranberries \$5.75 to \$6.50.

In the Produce Market

Potatoes are trending downward. Stocks arriving from Maine are more than plentiful while trade is unsatisfactory. Maines in 150 lb. sacks bring \$2.75 to \$3 while Long Islands bring \$2.50 to \$3.25. Bulk goods from Maine bring \$3.15 to \$3.40 while Long Islands bring \$3.50 to \$3.85.

The onion market continues slow, irregular and uneasy. Yellows bring 65c to \$1 with Western New Yorks having a little better of the deal. Orange County reds bring 75c to \$1.15.

Cabbage shows a little more life. Bulk goods bringing \$18 to \$20 while State cabbage in bags brings from 75c to \$1 per 90 pounds depending on quality and dock or street. Street sales being about 10c above dock sales.

Hay Closes Firm

The hay market closed firm after a week that started only fair. The supply of hay was slightly in excess of the fair demand and only a moderate amount of business transpired. Top grades have been scarce and moved freely. One car of straight No. 1 timothy in small bales sold at a premium. Straight timothy has brought from \$23 to \$28 with mixtures ranging from \$20 to \$26. Sample hay \$19 to \$20. Oat and wheat straw \$12 and rye straw \$14. Straw market is slow.

CATTLE

T. B. tested fancy, high-grade OHIO HOLSTEIN

and GUERNSEY SPRINGERS \$110 per head delivered; Jersey and Milking Shorthorn springers \$90 per head delivered. These cows are young, sound and good producers. A choice offering in reg. Guernseys and Jerseys. All ages. Fine wool ewes \$4.50 per head delivered. Coarse wool ewes, registered sheep, all breeds. Low prices. Satisfaction guaranteed.

A new Tractor

With Adjustable
Wheel Spacing
*for Every
Purpose » » »*

The illustration shows a few of the many treads from 48 to 84 inches at which the rear wheels can be spaced to fit various kinds of work. For plowing, the wheels set at the standard 48-inch tread eliminates side draft, hard steering and awkward hitch- es. For planting and culti- vating row crops, you can move the wheels out to fit practically any width of rows, from an 18-22 inch combi- nation to 48 inches apart and wider. The change is quickly and easily made.

A New Feature that gives you Two types of tractors *in* One

HERE is just the tractor you have always wanted. The new Case Model "CC" is the first tractor that successfully combines a plowing and a cultivating tractor. It has all the advantages of both types.

It is the first to offer an adjustable wheel spacing by which the rear wheels can be easily and quickly moved in or out, from standard 48-inch tread for plowing to various treads, up to 84 inches, for row crop planting and cultivat- ing. This gives you an adaptability you have never before seen in a tractor.

It gives you an efficient plowing tractor— either three or four wheels—that can be easily converted into an equally efficient planting and cultivating unit. Its ideal combination of de- pendable power, light weight and new fast speeds gives you an entirely new working capac- ity for every kind of farm job.

To operate this tractor is to experi- ence a new thrill. Fast irreversible steering gear makes steering excep- tionally easy. Independent differential brakes aid in quick handling between the rows and in pivoting on either rear wheel when turning short. Low center of gravity results in more stability and prevents side slipping.

Power lift eliminates the use of levers at the end of rows. Handy platform and comfortable seat enable the operator to stand or sit as he chooses. The tractor is amazingly simple and easy to care for. Inexperienced help can quickly learn to handle it skillfully.

Get in touch with the nearest Case dealer or send at once for new book fully describing these and many other unusual features which make it possible to speed up all farm work and cut your operating costs to the bone. Use the coupon for your convenience.

J. I. CASE CO., Racine, Wis.

If you are not familiar with the full line of Case farm machines, including the new Models "L" and "C" Tractors, it will pay you to find out about their advantages. Every machine has some new or salient features which add to its efficiency and profitable performance. Just say what implements you would like information on.

CASE

Full Line of Quality Farm Machines

Higher in quality—lower in price the great American value

Above is illustrated the New Chevrolet Six-Cylinder Coach

The new Chevrolet Six has been designed to give thorough satisfaction in long, hard service. High quality is built into every vital part of this bigger and better automobile.

There is more room for the family in the longer, wider Fisher bodies of the new Chevrolet—greater strength and solidity in the improved hardwood and steel body construction.

Chevrolet's dependable chassis has been materially improved—in such parts as the clutch, transmission, front axle, steering mechanism and radiator.

The frame is stronger. The wheelbase is longer. And several new features in the Chevrolet six-cylinder 50-horsepower motor add to sturdier engine construction and smoother operation.

Yet, with all the new strength and quality, Chevrolet's rigid standards of economy have been carefully maintained. In gasoline and oil consumption, in upkeep and maintenance, no other automobile shows a better cost-record than the new Chevrolet Six. And this bigger and better car is offered at new low prices that set it apart as *the Great American Value!*

Farm News from New York

Farm Bureau Members to Study City Markets---County Notes

ON February 23 to 26, farmers from all over New York State will travel to New York City on the annual Farm Bureau Market Study trip. Headquarters for the tour will be the Governor Clinton Hotel, 31st Street and 7th Avenue.

In addition to trips to the vegetable, fruit and poultry markets, the visitors will go to the Walker-Gordon Certified Milk Farm at Plainsboro to see the "rotolactor", the new milking machine which has received so much publicity. There will also be visits to a modern milk bottling plant, the Stock Exchange, and other points of interest in the city.

The Potato Situation

THE Federal Government recently reported on January 1st potato holdings. The total holdings in 35 states on January 1st amounted to 88,954,000 bushels, as compared with 89,684,000 in the same territory January 1st last year. The majority of this amount is in 19 surplus late potato states. The four principal eastern potato states have about 93 per cent as many potatoes as they had a year ago.

Reports come to us that cold weather has checked potato shipments from Maine. The temperature there has been as low as 30 to 40 degrees below zero.

Men who are growing potatoes as a cash crop will be able to get some light on the prospects when, in a week or two, the outlook report on agriculture will be published by the Farm Management Department of the State College of Agriculture.

Suggests Check on Road Machinery

THE present highway law permits towns to buy road machinery on the so-called "lease" plan. Governor Franklin D. Roosevelt recently made public a letter to State legislative leaders, stating that some highway engineers believed it would be wise for the Legislature to enact a law forbidding the spending of highway money for road equipment under the "lease" plan or, at least, to have its purchase regulated and approved by some State department. The Governor in his letter said:

"I believe that this situation requires immediate attention in order to cut down the cost of local government for highways, and the legislation should be prepared and introduced along the lines suggested."

Delaware County Holstein Men Organize

A FEW days ago Delaware County Holstein breeders met at the State School of Agriculture at Delhi and organized the Delaware County Holstein Club. The object of the club as stated in the constitution is to "establish a friendly intercourse among its members and the exchange of ideas; to promote the breeding and improving of high grade and purely bred Holstein-Friesian cattle in Delaware County; to aid its members in buying, breeding, and selling first class animals; also to establish a reputation for Delaware County as a Holstein-Friesian center, and it is the intention and expectation of this club at all times to work in conjunction with the New York Holstein-Friesian Association and the American Holstein-Friesian Association."

The officers elected are as follows: Peter Chambers, Walton, president; C. S. Hymers, DeLancey, vice-president; John Gosper, Walton, secretary-treasurer; T. V. Proskine, Roxbury, director; J. G. Van Dusen, Bloomville, director.

Chick Show for Southeastern New York

FOUR county Farm Bureaus in Southeastern New York are cooperating to hold a baby chick show at Liberty on March 12 and 13. This will be the second show of its kind to be held at Liberty, the first one having been held in March, 1930.

The success of last year's show has prompted the County Agents in Sullivan, Orange, Ulster and Delaware counties to

plan for another show this March. Hatcherymen are being invited to exhibit chicks and manufacturers and dealers of all kinds of brooding equipment are being invited to show their wares.

The chicks are to be judged by Mr. L. M. Hurd of Cornell University assisted by another member of the staff of the Poultry Department of the University. Farm Bureau surveys indicate that approximately 3,000,000 baby chicks are started in this area every year. One million of these chicks are started in Sullivan County alone.—PAUL ALLEN.

Future Farmers Compete for Speaking Prizes

NEXT November, students in vocational agriculture will compete at a National Public Speaking Contest during the American Royal Livestock Show at Kansas City. The country has been divided into four regions and in each region preliminary contests will be held with final contests to determine who will represent the region at Kansas City.

According to the report of Dr. C. H. Lane of the Federal Board for Vocational Agriculture, there are at present over 188,000 boys enrolled in vocational agriculture in approximately 3800 high schools in the United States.

Churchville High School Has Short Course

THE annual short course of the Agricultural Department of the Churchville High School was held in January. The program was sponsored by the Churchville Young Farmers. The first part of the course was given over to instruction of young men on the following subjects: means of increasing labor income under the present economic situation; theory of electricity; commercial arithmetic, and economics. During the last three days an electrical school was held.

The electrical school was the first of its

kind that has been held by an Agricultural Department of a High School in the State. The school was conducted by Professors Jennings, Wright, and Nixon of the New York State College of Agriculture. Due to the expansion of power lines with the subsequent development of electrical problems, it was decided that there was a need for a school of this type. This feeling was well justified as shown by the attendance. The following are

Dr. V. A. Moore

THE thousands of friends of Dr. Veranus A. Moore, dean emeritus of the New York State College of Veterinary Medicine, have been saddened by the news of his death. Dean Moore underwent an operation at the Ithaca Hospital and apparently was recovering, but his heart failed to stand the strain and he died quietly during the night.

Dean Moore was recognized as an authority in many lines not only in New York State but throughout the nation, and many will mourn his passing.

some of the topics that were considered: problems of rural electrification, uses of electricity on the farm, a wiring demonstration, how an electric motor works, how an electric refrigerator works, and how to connect farm machinery to an electric motor.—DOUGLAS DEUEL, President, Churchville Young Farmers, Churchville, N. Y.

Stresses Importance of Reforestation

FOR the past year or two there has been an unusual amount of interesting reforestation in New York State. Recently, the Conservation Commissioner, Henry Morgenthau, Jr., at a banquet given by the New York State Forestry Association in Albany, stressed the importance of the

so-called Hewitt reforestation amendment which was passed by the Legislature in 1930 and passed again by the present Legislature, to be voted on by the people next fall. The amendment, if passed, will contain a schedule of appropriations necessary to finance the program and will provide for the acquisition of reforestation areas outside of the Adirondack and Catskill parks.

Discussing the enlarged reforestation program which includes the planting of State forests and State aid for county forests, the Commissioner stated that during 1930, twenty counties had participated in planting county forests and had planted nearly 5,000,000 trees. That State aid is effective in stimulating county action in reforestation is shown by the fact that in 1930, twenty-two counties appropriated \$67,178 to be spent in planting county forests in 1931.

WGY Farm Radio Program

MOST of our readers are familiar with the excellent farm programs broadcast by radio station WGY at Schenectady. Two weekly features are the American Agriculturist Farm News, which is broadcast each Wednesday during the noon period, and the feature "Editor Ed Looks at Life", broadcast on Mondays during the noon hour.

Some speakers on farm subjects for future dates are as follows:

On February 23, Professor M. C. Bond of the New York State College of Agriculture, will speak on "The 1931 Outlook for Agriculture."

On March 9, Kirk Fox, editor of Successful Farming, will be the speaker.

On March 30, Dr. C. B. Sayre of the Geneva Experiment Station, will talk on "Canning Crops," and on April 20, Cyrus McCormick, Jr., vice-president of the International Harvester Co., will speak on "The Centennial of the Invention of the Reaper."

Other speakers of national prominence have been asked to appear on other dates and will be announced as available.

New York County Notes

Stafford townline road was completely destroyed by fire February 4th. A fire truck from Batavia was called out but could do very little toward saving it because of lack of water. The source of water supply has been a problem to many farmers. Some are compelled to carry water from quite a distance for not only cattle but their own use as well. The recent thaws have helped the cisterns but were insufficient for wells and streams.

—MRS. R. E. G.

Western New York Notes

Candlemas Day being bright and sunny the ground hog according to tradition has again snugly settled himself in the farthest confines of his hole to enjoy a six weeks' nap. Farmers have had a very favorable season for harvesting ice.

Where hill roads are being kept open and traffic is light, coasting is the major sport for children and young folks, and the long walk up seems no less pleasant than the swift flight down.

Another session of the State Grange is past and a little incident illustrative of grange cooperation and community spirit seems worth telling. A small country grange at Wyanale, Erie County, chose its master and his wife to represent it but being a young couple with three small children the young matron just brushed aside the proposition of her going, as one of the impossibilities. Her fellow grangers however, were insistent to the degree of offering not only to care for the children in their absence but to do the master's chores as well, and they accepted in the spirit it was offered and went. Who says that old-fashioned neighborliness is dying out?

GENESEE COUNTY—A banquet for the pea growers of the Haxton Canning Company was held at the I. O. O. F. Hall at Oakfield, on February 2nd. A big meal was served to about 120 men. Mr. Haxton explained that because of the large supply on hand, the price on peas would be dropped and a smaller acreage given this year.

A 10-room farmhouse owned by Mrs. Ada Houseknecht and on the Batavia-

CATTARAUGUS COUNTY—Nearly 200 dairymen and their wives met in the county seat grange hall in Little Valley recently for the sub-district session of the Dairymen's League of Cattaraugus and McKean Counties. No advance in milk prices for at least six months is expected due to the depression and under consumption. When the speaker of the day mentioned the untiring efforts of Governor Franklin Roosevelt to aid the farmer there was a round of applause although perhaps the Democrats present could be counted upon the fingers of one hand as this county is a strong Republican stronghold. However, the Governor carried the county last fall.

In the same hall after the dairymen, came the members of Little Valley grange at their regular meeting in the guise of a poverty social. Everything but patches and rags was taboo. After the program, the master, tattered and torn, announced "Soup's on" whereupon all marched to the dining room only to be seated by obliging waiters at tables minus cloths with nothing but a soup plate and spoon. Bean soup served in great kettles on the tables, with warm johnny-cake made up the menu. A brother remarked that a similar meal might prove a feast in much of our drought stricken country. The wife and son of Director A. L. Milks of the Dairymen's League won first and second prizes for best dressup suitable to the occasion. It consisted of the big sum of seven and three cents respectively. Fine winter prevails with the ground covered with snow.

More About Selling Eggs By Parcel Post

FIVE years ago we got our first customer through a daughter working for a family in a big city. Other customers came through one of our neighbors who kept city boarders. On the breakfast-table they found our eggs and henceforth they knew the difference between fresh eggs and others. We have supplied them since.

We never advertised or solicited for customers, we also never refused one. The profits never were so enticing, and the extra work was quite an item. Some of my friends chided me, that I sold eggs too cheap. But when I considered, that the postage both ways comes to about 10c per dozen, I had not the nerve to charge all the traffic would bear. I made it a rule to charge from 5 to 10c per dozen above the wholesale price. The lowest price in the summer when eggs were so plentiful.

My customers use the aluminum boxes, mostly the 4 dozen size. They buy their own box and ship it when they want eggs. I return the box at once and send them a bill for the eggs and the postage. Eggs always go insured.

I never lost a red cent, because when a new customer starts I ask them to send me a \$5 bill or check, and then they draw against this as they do against a deposit in the bank. When they see on their bill that their deposit is all gone they send me another \$5. I never had to ask for it. They know I treat them fair and they are most anxious to do the same to me.

Lately I have started to candle all eggs. That does away with complaints on meat—or blood-spotted eggs. These complaints were rare, and I always gladly made them good, but such eggs are no recommendation. Sometimes eggs were broken in transit or whole boxes were lost, but the Post-Office always paid for them. Live and let live! That gives the best satisfaction all around.—B. S., New York.

Treating an Outbreak of Roup

Can you tell me what is the trouble and cause with the disease among my hens. They get blind in one eye and it swells and finally bulges out of their head. The hen droops and feathers get fluffy and finally the hen dies. The disease seems to attack all ages and one of the turkeys now has it. I would be glad of any advice you could give as I have lost quite a few. Some too, are attacked with lameness and finally get so they can't move and die or have to be killed.—L. J. S., New York.

THERE are two causes for swollen eyes in hens. One is colds and old fashioned roup. The other is nutritional roup. We very seldom see cases of nutritional roup in this part of the country. It is due to a lack of vitamin A in the ration. With this disease there is no offensive odor associated with the swelling. The inside of the mouth and throat will be covered with whitish spots.

Treatments consist of giving cod liver oil or plenty of green food. It is more probable that your birds have roup of the regular variety brought on by colds. In that case you would probably notice an offensive odor. Birds that are badly affected are probably not worth trying to cure. They should be removed from the flock as soon as noticed since the disease is very contagious. The flock should be given epsom salts and the house kept as dry as possible. Thorough ventilation is also very essential.

Look around to see if you can find what has caused the trouble. There may be cracks in the buildings which are allowing drafts to blow on the chickens at night, or the house itself may be drafty during the day. Sometimes roup is associated with a rundown condition of the birds due to worms. If that is

ADDRESS _____ STATE _____

Building Cistern in Cellar

"Can you tell me how to build a concrete cistern with a built in filter of brick or other suitable material. Wish to build cistern in cellar 10 x 12 ft., 6 ft. deep with partition in same for filters."—B.R.C., N.Y.

In reply to your inquiry about building a cistern 10x12x6 feet in your cellar, would say that the only way to build such a cistern is to build it as an entirely separate concrete tank with solid bottom and walls all around and preferably all poured at one time and all well reinforced in each direction with regular reinforcing rods. For a tank 6 feet deep, the walls should be 8 inches thick at the bottom and about 6 inches at the top, should be made of a mixture of one bag cement, 10 lb. hydrated lime, two cubic feet of sand, three cubic feet coarse pebbles or broken stone, and just enough water to make jelly-like or quaky concrete that will have to be tamped into place. The floor should be 6 inches thick and should be reinforced with $\frac{3}{8}$ -inch round rods spaced 7 inches each way, and extended up about 18 inches into the side walls. The horizontal rods should be $\frac{3}{8}$ -inch spaced 5 inches apart at the bottom and 8 inches at the top. It would be well to put an extra piece across each corner half way between the others, letting these extend out 18 inches in each wall. The vertical rods should be spaced the same as the floor rods and should be lapped with and wired tightly to them. I am enclosing copy of a Farmer's Bulletin on Small Concrete Construction on the Farm. You can also get wonderfully good free bulletins from the Portland Cement Association, Chicago, Ill.—I. W. D.

Locking Nut on Pump Rod

"We are at a loss to know what to do about our well. Have had lots of trouble with our pump. The rod from the working valve works loose and falls into the well. It is almost a new pump and should have been a good one for the price.

"We live quite a way from town and it costs to get a plumber every once in a while. The well is only about ten feet from the house and it is 62 feet deep. There is about 25 ft. of water from the top of ground. Is there any way we could pipe it into the house and what kind of pump would we need? Could we do it satisfactorily? We have a cistern water pump on one side of sink in kitchen and would like the other pump on opposite side. Could it be a small pump?"—R.H., N.Y.

It is pretty hard to hold a nut or joint tight where it receives a hard jerk 25 to 30 times a minute a good many times a day. However, it can be done with the proper precautions. There are various ways of locking a joint, depending on how the rod connection is made. If the rod screws through the holding part with a nut on the other side, probably putting a spring lock washer under the nut would hold it. Or it is easy to make a lock washer by taking a washer of galvanized iron or even tin and slitting the outside edges, slip it over the rod and tighten down the nut firmly, then bend two of the slit edges down over the holding part and the other two up over the nut.

Or you might bore a hole through the rod to take a cotterpin, and use a castellated or notched nut, such as we see on the connecting rods of a car. Still another way is to use two thin nuts instead of a thick one, turning the second one down tight on the first one so as to lock them both. If the rod simply screws up into another part about the same general method of locking can be used. A nut can be screwed up into the proper adjustment, then held with a pipe wrench or a pair of pliers while the nut and lock washer are tightened up solidly. If preferred the thin slitted lockwasher can be used here instead of the spring lock washer. Or two thin nuts could be screwed on to the rod first, and then the second one

used to lock the first one. You might need to have the threads cut back a little further on the rod. Or it is a very common way of locking two parts to keep them from turning to adjust them until they are exactly right, then take a center punch or the sharp corner of a cold chisel and cut a slight groove in the rod just where it meets the other part. The slight burr this will make is usually sufficient to keep it from turning from the jar, but if it is not made too deep can easily be turned with a wrench.

If your well is 10 feet from house and is 25 feet from top of ground to water, you cannot draw the water with an ordinary cistern pitcher pump, since the additional distance from ground up to the cylinder just below the sink

would make the height too great for the sink pump to suck it. However, if you can make a pit at top of well about six or eight feet deep and extend this over under where the pump will set at the sink, then drop the pump cylinder down into this pit, with the suction pipe extending over and then down the well the pump will have to raise the water by suction only about 18 to 20 feet which is will do very nicely. The water will be lifted the rest of the way, and not sucked.—I.W.D.

Hydraulic Rams Pump Cheaply

WHERE there is plenty of water and a fall of two feet or more, a hydraulic ram often may prove the cheapest and most convenient method of pumping water for a water supply system for the farm. The cost of the ram will range from \$15 up and often the whole installation can be made for less than \$100. The water may be pumped almost any distance horizontally and up to 150 feet vertically. Write to American Agriculturist for further information and for a list of

firms supplying such equipment.—I. W. D.

About Battery Fluids

I am writing you to ask about the reliability of the Elliott Works, Inc. of Des Moines, Iowa, who sent me circulars on the Nu-Life battery fluid which they claim charges old and new batteries instantly and holds their charge indefinitely. They are trying to interest me in becoming an agent who would sell their product.

WE have never been able to find any expert on storage batteries who would recommend putting anything into a battery except distilled water after the original solution has been placed in the cells.

When a basement is dug, subsoil should be put on one side and surface soil on the other. Then, when the lawn is graded, subsoil may be laid down first and surface soil may be added as a top layer, as it should be.

Good ventilation is not confined to expensive poultry houses. An effective system can be devised cheaply for any house.

Reduce the Cost of Making Seedbeds

with McCORMICK-DEERING Tillage Tools

THOUSANDS of farmers are putting the newer, fast-working McCormick-Deering Tillage Tools into very profitable service with a very moderate investment.

Right now, stop and analyze which phase of your tillage work is getting away with a share of your yearly profit. Then decide to cull out the time-and-money-wasting tools to blame for the loss; replace them with equipment that does faster and better work at less cost.

Resolve to keep yourself among the efficient farmers and equip yourself to stay abreast of the best of them. Plan your tillage work and other operations so that every hour of time, every effort of labor, and every job you undertake will count for the utmost.

the case, you could not hope to get rid of the trouble until you had treated the hens with a worm eradicator. In case you want to individually treat the birds a strong bichloride of mercury solution is very effective when forced through the nasal passages from the inside by using a syringe with a curved nozzle, and inserting it in the cleft in the roof of the mouth. A non-poisonous disinfectant should be used in the drinking water to aid in the prevention of the spread of the disease.—L. E. Weaver.

Missed Feeding Caused Molt

"I have 170 pullets hatched April 4th last and about twenty old hens. They grew well and commenced laying when four and a half and five months' old. Through an oversight they missed their grain one night and morning. They fell off in production and went into a neck molt. Just before Christmas I put lights on them and they are laying now about 140 eggs a day. Are they laying too heavily and how much scratch grain should they have while producing so heavily? I am feeding Beacon scratch grain composed of corn, wheat and a little barley. I am feeding a mash with oil mixed in. Do I lose the value of the oil and is there enough in it to do any good? My supply of cabbage is getting low. Will that amount of oil do for green stuff when cabbage is gone?"—M.F.B., Pa.

ONE hundred and forty eggs from 190 birds means 73 per cent production. That is not too heavy laying for well-bred, well-fed and vigorous hens provided you are able to induce them to eat sufficient food to make that many eggs and to maintain their body weight. Assuming that they are Leghorns averaging 4 lbs. each your 190 birds should be eating 51 or 52 pounds of feed per day. That is grain and mash combined and including the dry weight of all wet mash that is fed. Heavier birds should be consuming 3 or 4 pounds more than that.

Commercial feeds containing cod liver oil usually are supplied with an excess which takes care of the slight loss through oxidation. You need not worry about the oil.

If your mash contains a fairly high percentage of dried milk, or if you are feeding milk in other forms there will probably be no ill effect from the absence of green food. However, I would suggest that you cut down on the amount of green stuff now being fed and thus make the supply last longer, and postpone the possible bad psychological effect on the hens of not getting the greens when they are expecting them.—L. E. Weaver.

Faulty Ventilation

"Can you tell me what is the matter with my basement henhouse. The walls sweat so and the straw becomes wet and it has a damp feeling when you go in. Upstairs over the henhouse is a tool house. It has only a single floor and there are cracks in the floor about 1/4 inch. It has a wall on three sides; north, east and west. The south is boards and the cracks are anywhere from a 1/2 to an inch apart. One window on the east a door and three windows on the south. The size is 24x30. I do not understand why it should be wet."—E. C., Conn.

THERE is only one explanation for dampness in any poultry house, the moisture is not being removed fast enough to keep the room dry. As a rule a well-ventilated room will keep dry in all weather if there are not too many hens. It is almost impossible to keep an over-crowded house dry, especially in cold weather. Perhaps that may be your trouble.

It would seem from your description that enough air would be admitted through the cracks in the south side, and enough would escape through the ceiling to give plenty of ventilation. But it is evident from your letter that ventilation is not sufficient. There is a pos-

sibility that the air doesn't get a chance to get away after getting into the room above. It is also possible that your floor is allowing moisture to come up from below.

If none of these suggestions help you to overcome the difficulty, you can resort to this. Set up a brooder stove and operate it, keeping two or three windows open all the time. It is also important that the room temperature does not get above 50-55.—L. E. Weaver.

The Fourteenth Week at Storrs

IN the Storrs laying contest, the first week in February showed a gain of 207 eggs over the previous week's production and was 75 eggs better than the first week in February a year ago. These gains were distributed, in that five of the six different classes did a little bit better and the other held its own.

The entire 100 pens laid a total of 4,682 eggs, or a yield of 66.9 per cent. Leghorns continued to lead with a lay of over 80 per cent, and Rhode Island Reds ran second with a yield of well over 60 per cent. Both varieties of Rocks were so near the 60 per cent level as to justify counting them in this class.

For three successive weeks West Neck Farm's pen of Rhode Island Reds from Huntington, Long Island, has led the list. This 10-hen team has not only held the pole, but has come through regularly each week with precisely the same score, namely, 67 points. J. A. Hanson and his pen of Leghorns from Corvallis, Oregon, made second place for the week with a tally of 64 points.

Another pen of Leghorns, bred by Wene Chick Farm of Vineland, N. J., tied for third place with three pens of Rhode Island Reds. All four chalked up 63 points each. G. B. Treadwell of Spencer, Mass., Homestead Farms of Newtown, Conn., and Donald I. Good-enough of Torrington, Conn., are the breeders who backed the Reds.

The use of electric lights in poultry houses is no longer an experiment. It is more a question of getting at the job and having the lights installed. The size of light, the number, how to place them, and what equipment to use and how, with other questions are answered in the practical way in extension bulletin 90, Artificial Illumination of Poultry Houses for Winter Egg Production. A free copy may be obtained from the office of publication, state college of agriculture, Ithaca, New York.

When fields are too stony or too poor to grow crops, they should be made to return profit by growing trees.

KERR'S BABY CHICKS WILL NOT DISAPPOINT YOU NEXT FALL

ONLY chicks from heavy-laying stock become profitable egg producers. High egg yield is an inherited quality.

Kerr's baby chicks have a rich inheritance from birds that have made big records in the leading egg-laying contests. Our White Leghorns have official production records up to 304 eggs in a year. Our Barred Rocks have produced up to 277 eggs and our R. I. Reds have laid up to 300 eggs in 365 days.

The prepotency of the Kerr strains of baby chicks for high egg yields is a fixed quality. In addition to heavy egg production, they excel in correct breeding type and lusty vigor, and are available from stock tested for B. W. D. Send for Kerr's fully illustrated Chick Book and the prices, sent free upon request.

Aunt Janet's Corner

Here Is Proof That "Things Do Not Make the Man" Nor His Happiness

THIS letter came in as a contribution to the "Recipe for Happiness Contest" and because of its revelation of an unusual personal experience, it was passed on to Aunt Janet for use in her column. It shows real character for an

Like the firefly I must make my own light if life would hold any bright spots for me.

First of all, I find a morning prayer is the foundation upon which I build my happiest days. It fortifies me for whatever condition in life I may be required to meet. I have received some crushing blows from the hand of fate, however, I rally from these in a remarkable manner. I burn my sorrow because the world has its share, and so I give smiles instead of frowns. The chief joy I find in living is in scattering seeds of kindness every day. This has

out a neck, and bound it with dark blue bias binding, leaving ends to tie.

To two opposite corners I attached snaps to fasten around the waist, as Junior is rather slim, but a stouter boy would need ties of the blue binding. These have proved highly satisfactory, as they completely cover the blouse. In fact I have made a few as a gift to a nephew of the same age, and they will be accompanied by this rhyme:

"I'm sending to you a bandanna of blue,
It carries a kind, loving greeting;
Tie it, please, round your neck,
If you do, not a speck
Will get on your clothes when you're
eating!" —A.B.S.

Smart Vogue

2970

PEPLUM DRESS NO. 2970 is in very smart vogue just now. The sports type pictured here is a crepe patterned woolen with youthful pique collar and cuffs. The peplum is circular, as is the skirt beneath it. The pattern may be had in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires $4\frac{1}{2}$ yards of 39-inch material with $\frac{3}{4}$ yard of 39-inch contrasting. PRICE 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps. (Don't send coin). Add 12c for one of the new Spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

been a custom with me since early childhood and is the surest source of real joy that I know of. Adding to this a keen appreciation of the beauties of nature I find life well worth living, and "not half as bad as it might be," which expression earned me the title of "Modern Polly Anna."

A Bib That Is Not a Bib

JUNIOR thought he was entirely too old for bibs, but at the same time I was reluctant to sacrifice my good-sized dinner napkins to protect the young man's fresh school blouses. So I hied me to the five and ten, and bought a few dark blue bandanna handkerchiefs. I cut off one corner, hollowed

Choose Colors For Personality

STYLE demands certain colors, but the wise woman chooses colors most becoming to her, regardless of what colors are being emphasized that season. The subdued colors are usually most becoming to all, and more especially to large figures. Bright colors are only for touches of decoration or for small figures. Vivacious people can wear the brighter colors while the dainty, "delicate" types will want the softer shades.

Guard against coarse cleaning powders which may scratch the finish of your bathtub, sink, or washstand. Hot soapsuds applied with a brush or cloth is effective and safer.

Simple and Chic

2956

DRESS PATTERN NO. 2956 is a simple, smart day model which is very becoming to mature figures. It is especially good when made up in a dark ground printed crepe silk, trimmed with a lighter blending shade in plain crepe silk. The grouped plaits give a smart flare to the slim straight skirt. The pattern cuts in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires $3\frac{3}{4}$ yards of 39-inch material with $\frac{3}{4}$ yard of 27-inch contrasting. PRICE 15c.

individual to arrive at a philosophy of life which allows her to be happy in spite of the blows which fate sometimes sees fit to deliver.

* * *

Last night after finishing my work for another day and while sitting alone by the fire in my rural home, I reached for a copy of the American Agriculturist expecting to relish one of the spicy chestnuts usually to be found on page four.

Instead I found Mr. Eastman was asking us for our recipes for happiness.

This caused me to wonder myself, as I have no radio or other music to entertain me; I spend approximately three hundred and sixty days in a year at home where electric lights are the only modern convenience at hand.

I can not remember attending but five public gatherings in the past nine years which are as follows: two funerals, two W. C. T. U. meetings, and one church entertainment.

I am not blind, deaf or bedridden.

SOUR STOMACH

JUST a tasteless dose of Phillips' Milk of Magnesia in water. That is an alkali, effective, yet harmless. It has been the standard anti-acid for 50 years among physicians everywhere. One spoonful will neutralize at once many times its volume in acid. It is the right way, the quick, pleasant and efficient way to kill the excess acid. The stomach becomes sweet, the pain departs. You are happy again in five minutes.

Don't depend on crude methods. Employ the best way yet evolved in all the years of searching. That is Phillips' Milk of Magnesia.

Be sure to get the genuine Phillips' Milk of Magnesia prescribed by phy-

sicians and used by druggists in prescriptions.

Remember—the genuine is always a liquid. It cannot be made in tablet form. Look for the name Phillips' on every bottle for your protection. 25c and 50c, at drugstores everywhere.

THE BEST WAY TO WHITEN TEETH

A single application of Phillips' Dental Magnesia Tooth-paste makes teeth glistening white and the breath sweet.

Prove it at our expense. Write The Phillips Co., 170 Varick Street, New York, N. Y., for free ten-day tube.

When I Can Meat

Reader Tells What Experience Has Taught Her

WHILE I have been so very busy the past week "canning" the beef I blundered into some very helpful items which I thought you might like to put in American Agriculturist.

To can the beef, I cut it into convenient chunks to go into glass fruit cans. For each quart can I used $\frac{1}{4}$ teaspoon pepper and 1 teaspoon salt. This I mixed together and added as I packed the raw meat into cans. I put suet into each can and always a chunk of it on top of the can. When cans are filled put on rack in boiler with cold water and boil continuously for four hours. Keep a teakettle with boiling water so you can add to canning boiler as it boils off. Put covers on cans as you would in any cold pack method. Also have cans cold and dry and *never* put water on the beef you can or let it freeze. Can as soon as animal heat is out. Of course, there are no bones left in the chunks of meat which I can. I have used this method for several years and find it very good, as I have had my meats keep well.

When canning beef, I cut away all stringy pieces, edges where the hide was removed, bits of gristle, bones, etc.

Later, I take all the bones, saw into convenient pieces, take all scraps from the meat I canned and cook with water to make soup stock. Strain this stock after meat cooks from the bones, set to cool. Take off the fat, (the stock must be a thick stock—like jelly). Re-heat boiling hot and process in hot cans in a boiler of water for $1\frac{1}{2}$ hours steady boiling. Put covers on cans (rubbers too, of course) as for cold-pack method. Keep water well above the tops of the cans.

The last few years my husband has saved the "gut" fat from the beef around the pouch. This I soak out as pig gut fat, and when the blood has drawn out, I put it through the food

chopper and it is "no time" before the tallow is fried out. This is stored away and when I open my canned meat, if there isn't sufficient fat for gravy, I add some of my tallow, also I use this tallow for soups. A neighbor takes part beef tallow with lard to fry fried cakes.

In canning, sometimes our wash boilers are too large for the amount we want to can and take too much water. I have a 25 lb. shredded cocoanut can which holds 7 qts. or 8 pt. cans and only covers one hole on the stove. This has a cover that slips over the top, making it easy to open when hot, and two very strong handles on the sides. An old grater (like we grate horse-radish on), when flattened out, makes an excellent false bottom in one of these cans.

When making soup, if I haven't much meat when the soup-bone is cooked, I take the meat out with a skimmer and put through the food chopper and stir through the soup when it is made, letting it stand a few minutes to "blend" well.

In making mincemeat, I use the neck piece of the beef. This I soak out at once. I can or make soup of the stock from this, too.

I find if I put can rubbers on cans cold before I put them into hot water or before filling them in canning, I do not burn my fingers so much.

Also, when cooking mincemeat (and who of us hasn't had it settle and burn at the last minute), I take my grate from the oven and put on top of the stove and set kettle of mincemeat on that and it doesn't scorch.

If one must hurry to get mincemeat out of the way, try cooking the apples and vinegar first. The apples can be cooked done in a short time and the other ingredients can be added to the apples and it's less than half the time in cooking.—MRS. P. J. M.

Ready Cut Quilts

Ready cut quilts save you all the tedious marking of materials and endless cutting of hundreds of small pieces. The assortment comes to you complete, all of the pieces accurately cut of best quality percale, guaranteed color fast. A detailed chart shows exactly how to sew the pieces and quickly make up the quilt.

The Blazing Star is a glorious quilt in yellow and orange tones. Finishing with 2 two-inch strips, it makes a top 80 inches wide by 92 long. Ready cut blocks, the units in white, yellow and orange for 21 pieced star blocks, all ready to seam together is No. M285 at \$3.00 postpaid. Instructions for making accompany all orders. Alternate blocks of the same fine quality white 12 inches square, each stamped with a feather circle ready for quilting is No. M285A at \$1.75 for the set of 21 blocks. Without the border, the quilt is right for a twin bed, or border strips in white and yellow may be ordered as No. M285B at 75c.

A ready cut pillow with the blazing star as a top is No. M285C for top pieces, boxing and back at 50c.

If you wish the pattern alone on this quilt you may get it in our patchwork pattern book No. M631C price 15c. There are eleven other authentic designs in this book.

Order from Embroidery Dept., American Agriculturist, 10 N. Cherry Street, Poughkeepsie, New York.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is lonely but several new friends make life more pleasant for him. There is blind Joe Glaspell who plays the violin, Jack and his sister, Jill, who rescue him when he gets into a fight over a kitten, and his "Lady of the Roses" who lives in the beautiful house on the hill.

It develops that Jack and the "Lady of the Roses" are not on good terms. One day Jack tells David and Jill a fairy story about "the princess and the pauper." The story is so consistent that it is difficult to imagine that it is entirely fiction.

Mr. and Mrs. Holly seem to be in serious trouble. As near as David can guess, it concerns money. Having no use for the gold pieces his father left him and wishing to help, he astonishes the Hollys by bringing his cap full of gold pieces.

At the jingle of the coins Simeon Holly and his wife lifted their heads abruptly. A half uttered sob died on the woman's lips. A quick cry came from the man's. He reached forth an eager hand and had almost clutched the gold when a sudden change came to his face. With a stern ejaculation he drew back.

"Boy, where did that money come from?" he challenged.

David sighed in a discouraged way. It seemed that, always, the showing of this gold meant questioning—eternal questioning.

"Surely," continued Simeon Holly, "you did not—" With the boy's frank gaze upturned to his, the man could not finish his sentence.

Before David could answer came the voice of Perry Larson from the kitchen doorway.

"No, sir, he didn't, Mr. Holly; an' it's all straight, I'm thinkin'—though I'm free ter confess it does sound nutty. His dad give to him."

"His—father! But where—where has it been ever since?"

"In the chimney cupboard in his room, he says, sir."

Simeon Holly turned in frowning amazement.

"David, what does this mean? Why have you kept this gold in a place like that?"

"Why, there wasn't anything else to do with it," answered the boy perplexedly. "I hadn't any use for it, you know, and father said to keep it till I needed it."

"'Hadn't any use for it!'" blustered Larson from the doorway. "Jiminy! Now, ain't that jest like that boy?"

But David hurried on with his explanation.

"We never used to use them—father and I—except to buy things to eat and wear; and down here you give me those, you know."

"Gorry!" interjected Perry Larson. "Do you reckon, boy, that Mr. Holly himself was give them things he gives ter you?"

The boy turned sharply, a startled question in his eyes.

"What do you mean? Do you mean that—" His face changed suddenly. His cheeks turned a shamed red. "Why, he did—he did have to buy them, of course just as father did. And I never even thought of it before! Then, it's yours anyway—it belongs to you," he argued, turning to Farmer Holly, and showing the gold nearer to his hands. "There isn't enough, maybe—but 't will help!"

"They're ten-dollar gold pieces, sir," spoke up Larson importantly; "an' there's a hundred an' six of them. That's jest one thousand an' sixty dollars, as I make it."

Simeon Holly, self-controlled man

that he was, almost leaped from his chair.

"One thousand and sixty dollars!" he gasped. Then, to David: "Boy, in Heaven's name, who are you?"

"I don't know—only David." The boy spoke wearily, with a grieved sob in his voice. He was very tired, a good deal perplexed, and a little angry. He wished, if no one wanted this gold, that he could take it upstairs again to the chimney cupboard; or, if they objected to that, that they would at least give it to him, and let him go away now to that beautiful music he was to hear, and to those kind people who were always to understand what he said when he played.

"Of course," ventured Perry Larson diffidently, "I ain't professin' ter know any great shakes about the hand of the Lord, Mr. Holly, but it do strike me that this 'ere gold comes mighty near bein' proverential—fur you."

Simeon Holly fell back in his seat. His eyes clung to the gold, but his lips set into rigid lines.

"That money is the boy's, Larson. It isn't mine," he said.

"He's give it to ye."

Simeon Holly shook his head. "David is nothing but a child, Perry. He doesn't realize at all what he is doing, nor how valuable his gift is."

"I know, sir, but you *did* take him in, when there wouldn't nobody else do it," argued Larson. "An', anyhow, couldn't you make a kind of an I O U of it, even if he is a kid? Then, some day you could pay him back. Meanwhile you'd be a'keepin' him, an' a-schoolin' him; an' that's somethin'."

"I know, I know," nodded Simeon Holly thoughtfully, his eyes going from the gold to David's face. Then, aloud, yet as if to himself, he breathed: "Boy, boy, who was your father? How came he by all that gold—and he—a tramp!"

David drew himself suddenly erect. His eyes flashed.

"I don't know, sir. But I do know this: he didn't *steal* it!"

Across the table Mrs. Holly drew a quick breath, but she did not speak—save with her pleading eyes. Mrs. Holly seldom spoke—save with her eyes—when her husband was solving a knotty problem. She was dumfounded now that he should listen so patiently to the man, Larson—though she was not more surprised than was Larson himself. For both of them, however, there came at this moment a still greater surprise. Simeon Holly leaned forward suddenly, the stern lines quite gone from his lips, and his face working with emotion as he drew David toward him.

"You're a good son, boy,—a good loyal son; and—and I wish you were mine! I believe you. He didn't steal it, and I won't steal it, either. But I will use it, since you are so good as to offer it. But it shall be a loan, David, and some day, God helping me, you shall have it back. Meanwhile, you're my boy, David,—my boy!"

"Oh, thank you, sir," rejoiced David. "And, really, you know, being wanted like that is better than the start would be, isn't it?"

"Better than—what?"

David shifted his position. He had not meant to say just that.

"N—nothing," he stammered, looking about for a means of quick escape. "I—I was just talking," he finished. And he was immeasurably relieved to find that Mr. Holly did not press the matter further.

CHAPTER XIX

THE UNBEAUTIFUL WORLD

IN spite of the exaltation of renunciation, and in spite of the joy of being newly and especially "wanted," those early September days were sometimes hard for David. Not until he had relinquished all hope of his "start" did he

fully realize what that hope had meant to him.

There were times, to be sure, when there was nothing but rejoicing within him that he was able thus to aid the Hollys. There were other times when there was nothing but the sore heart-ache because of the great work out in the beautiful world that could now never be done; and because of the unlovely work at hand that must be done. To tell the truth, indeed, David's entire conception of life had become suddenly a chaos of puzzling contradictions.

To Mr. Jack, one day, David went with his perplexities. Not that he told him of the gold-pieces and of the unexpected use to which they had been put—indeed, no. David had made up his mind never, if he could help himself, to mention those gold-pieces to any one who did not already know of them. They meant questions, and the questions, explanations. And he had had enough of both on that particular subject. But to Mr. Jack he said one day, when they were alone together:—

"Mr. Jack, how many folks have you got inside of your head?"

"Eh—what, David?"

David repeated his question and attached an explanation.

"I mean, the folks that—that make you do things."

Mr. Jack laughed.

"Well," he said, "I believe some people make claims to quite a number, and perhaps almost every one owns to a Dr. Jekyll and a Mr. Hyde."

"Who are they?"

"Never mind, David. I don't think you know the gentlemen, anyhow. They're only something like the little girl with a curl. One is very, very good, indeed, and the other is horrid."

"Oh, yes, I know them; they're the ones that come to me," returned David, with a sigh. "I've had them a lot, lately."

Mr. Jack stared.

"Oh, have you?"

"Yes; and that's what's the trouble. How can you drive them off—the one that is bad, I mean?"

"Well, really," confessed Mr. Jack, "I'm not sure I can tell. You see—the gentlemen visit me sometimes."

"Oh, do they?"

"Yes."

"I'm so glad—that is, I mean," amended David, in answer to Mr. Jack's uplifted eyebrows, "I'm glad that you understand what I'm talking about. You see, I tried Perry Larson last night on it, to get him to tell me what to do. But he only stared and laughed. He didn't know the names of 'em, anyhow, as you do, and at last he got really almost angry and said I made him feel so 'buggy' and 'creepy' that he wouldn't dare look at himself in the glass if I kept on, for fear some one he'd never known was there should jump out at him."

Mr. Jack chuckled.

"Well, I suspect, David, that Perry knew one of your gentlemen by the name of 'conscience,' perhaps; and I also suspect that maybe conscience does pretty nearly fill the bill, and that you've been having a bout with that. Eh? Now, what is the trouble? Tell me about it."

David stirred uneasily. Instead of answering, he asked another question.

"Mr. Jack, it is a beautiful world, isn't it?"

For a moment there was no answer; then a low voice replied:—

"Your father said it was, David."

Again David moved restlessly.

"Yes; but father was on the moun-

tain. And down here—well, down here there are lots of things that I don't believe he knew about."

"What, for instance?"

"Why, lots of things—too many to tell. Of course there are things like

catching fish, and killing birds and squirrels and other things to eat, and plaguing cats and dogs. Father never would have called those beautiful. Then there are others like little Jimmy Clark who can't walk, and the man at the Marstons' who's sick, and Joe Glaspell who is blind. Then there are still different ones like Mr. Holly's little boy. Perry says he ran away years and years ago, and made his people very unhappy. Father wouldn't call that a beautiful world, would he? And how can people like that always play in tune? And there are the Princess and the Pauper that you told about."

"Oh, the story?"

"Yes; and people like them can't be happy and think the world is beautiful, of course."

"Why not?"

"Because they didn't end right. They didn't get married and live happy ever after, you know."

"Well, I don't think I'd worry about that, David,—at least, not about the Princess. I fancy the world was very beautiful to her, all right. The Pauper—well, perhaps he wasn't very happy. But, after all, David, you know happiness is something inside of yourself. Perhaps half of these people are happy, in their way."

"There! and that's another thing," sighed David. "You see, I found that out—that it was inside of yourself—quite a while ago, and I told the Lady of the Roses. But now I—I can't make it work myself."

"What's the matter?"

"Well, you see *then* something was going to happen—something that I liked; and I found that just thinking of it made it so that I didn't mind raking or hoeing, or anything like that; and I told the Lady of the Roses. And I told her that even if it wasn't going to happen she could *think* it was going to, and that that would be just the same, because 't was the thinking that made my hours sunny ones. It wasn't the *doing* at all. I said I knew because I hadn't *done* it yet. See?"

"I—think so, David."

"Well, I've found out that it isn't the same at all; for now that I *know* that this beautiful thing isn't ever going to happen to me, I can think and think all day, and it doesn't do a mite of good. The sun is just as hot, and my back aches just as hard, and the field is just as big and endless as it used to be when I had to call it that those hours didn't count. Now, what is the matter?"

Mr. Jack laughed, but he shook his head a little sadly.

"You're getting into too deep waters for me, David. I suspect you're floundering in a sea that has upset the boats of sages since the world began. But what is it that was so nice, and that isn't going to happen? Perhaps I *might* help on that."

"No, you couldn't," frowned David; "and there couldn't anybody, either, you see, because I wouldn't go back now and *let* it happen, anyhow, as long as I know what I do. Why, if I did, there wouldn't be *any* hours that were sunny then—not even the ones after four o'clock; I—I'd feel so mean! But what I don't see is just how I can fix it up with the Lady of the Roses."

"What has she to do with it?"

"Why, at the very first, when she said she didn't have *any* sunshiny hours I told her—"

"When she said what?" interposed Mr. Jack, coming suddenly erect in his chair.

"That she didn't have any hours to count, you know."

"To—count?"

"Yes; it was the sundial. Didn't I tell you?"

"Yes, I know I did—about the words on it—not counting any hours that

(Continued on Page 24)

How the Grange Was Started

An Interesting Item from Secretary Riley---Other Letters from Our Readers

GEORGE Washington in a message to Congress urged rural organization. Benjamin Franklin with others, organized a Society to Promote Agriculture. In 1855, William Saunders printed an article outlining plans for a farm organization. However, it was not until the Grange came into existence that a real farm organization was founded on American soil. On January 1, 1866, Oliver H. Kelley, a Minnesota farmer, born and educated in New England, was appointed by the government to make a survey of agricultural conditions in the south. This study of the distressed condition of agriculture and the advantages he found from his membership in the Masonic Order, convinced him of the need of a national farmers' organization, founded as a fraternity.

Upon returning to Washington, D. C., he made the acquaintance of others of the Department of Agriculture and government service, and discussed with them his plans for a national farm organization. They were sympathetic; the idea grew, and on December 4, 1867, the National Grange was organized by seven men, later called the Grange Founders. These men were Oliver H. Kelley, J. R. Thompson, William M. Ireland, William Saunders, Rev. A. B. Grosch, F. M. McDowell, and Rev. John Trimble. In considering his plans for the Grange, Father Kelley consulted with his niece, Miss Carrie Hall, a woman of rare intelligence and education who suggested that a farm organization would be incomplete unless woman was given an equal place with man. To her belongs the honor of being the first woman to be elected or appointed in a farm organization, she being the first Ceres, of the National Grange. The founders, after laying their plans and preparing degree work, organized Potomac Grange No. 1, at Washington, D. C., as a practice Grange and also for its Washington members.

The First Subordinate Grange

The first printed Grange manuals made their appearance in March 1868. On the third of April of the same year, Father Kelley, who had been chosen secretary of the National Grange, left Washington on an organization trip with but \$2.50 in his pockets. Mr. Carr, in his book, "America Challenged," says that "No equal amount of money in America's history ever brought greater results."

On April 16, Fredonia Grange No. 1, was organized at Fredonia, New York, this being the first actual farm organization of its kind in the world. This Grange is the home of our Past State Master and Past National Master, S. J. Lowell. During the time from 1869 to 1871 Grange progress was slow. Early in 1871, however, conditions changed and Granges were being more easily organized until today New York State has 873 subordinate Granges with a membership of 130,000. In the beginning Granges were brought together in what was called County Council. In the late seventies this was changed to the Pomona Grange as a regularly established link in the Grange chain. New York State now has 53 Pomona Granges.—F. J. RILEY.

Roadside Stands Get the Consumer's Dollar

THE chief advantages of roadside stands to the fruit grower are that they eliminate the middleman and that all transactions are for cash. The roadside stand also offers an opportunity for the sale of a far greater variety of products than would otherwise be possible, such as fruit by-products and perishable goods that could not be shipped to distant markets.

Success with these stands depends largely upon the attention given to details which make the stand attractive to the passerby and upon the

courtesy and energy of the owner. Special containers adapted to the commodities and quantities sold at the roadside should be provided and should be made as attractive as possible. Of course they need not be as strong as containers used for shipping products to distant markets.

Remove Snow from Dirt Roads Too!

IN answer to your request in American Agriculturist about what we think of snow fences and the plowing of roads, I wish to give my opinion and which I believe others in this community hold as well.

Snow fences have helped keep the roads from drifting. We approve of them very much. Plowing of roads is a real benefit and we believe money well spent, but is it fair to us on dirt roads who buy our license, pay gasoline tax, to have to put up our cars and trucks because we can't get the mile or two to the plowed road? Why shouldn't they plow and keep open the dirt roads as well as the improved roads?

In going to the milk station every morning with the milk, we have to drive bobs to the main road and (where the roads are plowed) then change to a wagon to go over the bare road. This not only takes much more time than it does to go by truck from the house, but it means much more work of transferring the milk so many times. Then, too, we have to keep a wagon at the corner where there is no covering for it. Children wishing to play, play in it and many times have been known to do damage. We will smile and pay our taxes when we can have the conveniences of the man living a mile away on the improved road.—MRS. STANLEY JAQUAY, So. Edmeston, N. Y.

In Favor of Snow Removal

IN a recent issue you ask for farmers' opinions as to whether or not the removal of snow from our country highways is an unmixed blessing. Back in the old days and not so long ago, we looked forward with pleasant anticipation to the coming of the snow and took great delight in the music of the sleigh bells.

We were content to drive in roundabout ways through fields and yards, down through gullies and up the hill-

sides to get to church, school, the Post Office, or wherever business or pleasure called. But the coming of the automobile and truck, while not so musical as the sleigh bells, has brought about a wonderful change in our methods of transportation and make it necessary to remove snow from our country highways. This in turn has brought about a great increase in farmers' taxes; the price that has to be paid for human progress.

Last year our own county of Genesee, outside of the incorporated towns, appropriated \$54,000 for clearing snow from country highways. In our own opinion, snow is no longer desirable on our highways or elsewhere.—W. C. LOGAN, Leroy, N. Y.

Comments on Old Stone Tower at Newport

AFTER reading the A. A. cover about the old stone mill, this comes to my mind. A description once read in Berson A. Lassing's "Field Book of the American Revolution" which was printed in the early fifties said that the Old Stone Tower had been at one period of the Revolutionary War used as a powder magazine for the British and that it at that time was roofed. On leaving that locality, the British set fire to the woodwork of the Tower, also placing kegs of powder beneath it in an attempt to destroy it. But the stone work was too sturdy to be demolished. Also Lassing writes that he was informed that in an attempt to discover, by digging around the base of the columns, some clue to its origin, it was found that each column was set on a large globe of stone several feet below the present surface of the soil.

As to its origin, Lassing says that while the general opinion is that it is of Norse construction, there is a rock on the shore of a nearby stream that can be seen at very low water plainly enough to decipher rudely cut inscriptions about which opinions differ. Some pronounce them Ruric, still others regard them as Phoenician on the theory that ancient Phoenician navigators, storm driven, had made a landing at that place. In a note to above Lassing says that some are of the opinion that the old Tower is one of the most Western outposts of that mythical continent, the lost Atlantis, said to have been destroyed by a great convulsion of nature and im-

mediately follows this statement by a long article on Atlantis from the writings of many learned men.

The Endicott Public Market

SOME twelve or thirteen years ago, Mr. George F. Johnson gave to John Patterson the commission to establish a public market in Johnson City and one in Endicott where the farmer could sell his produce direct to the shoe worker or anyone who wished to buy.

These markets started on some vacant lots and were a success. The Endicott market now has a building with about 70 stalls into most of which you can drive your truck and have plenty of room to display your produce. This building is heated in the winter. There is also a large vacant lot in the rear of the building used for the overflow. There at times more than 100 producers sell on this market on Saturday, 90% of them farmers and the rest hucksters.

The market is managed by a market master, John Patterson by name who spends his time between Johnson City and Endicott. We have sold the most of the products of our farm on the Endicott market for the past six or seven years.

We grow all sorts of vegetables but specialize on peas, cucumbers and potatoes. We sell all of our poultry and most of our eggs and in the fall and winter dress lambs for the market. In this way we get nearly all of the consumer's dollar and it pays well when you have quality and quantity.

You will find all kinds of fruits, vegetables, poultry, and meats sold here; the hucksters selling the things that are out of season in this locality, especially the fruits. They are not allowed to sell anything that is in plentiful supply from the farmers.

We find that quality produce is always in better demand and sells at a better price than poor quality. The farmer who takes a load of poor quality stuff to this market now and then is usually disappointed. In order to have a good business here you must have good quality and be there regularly.

Farmers have sold over \$20,000 worth of products in this market in one week.—FRED FEHR.

Show You Mean Business!

THERE are three things which in my opinion will go a long ways toward marking a farmer as a live up-to-date business man. They are: a suitable name for his farm, a good typewriter and printed stationery.

Much has been written in the various farm papers of this country on the subject of suitable names for farms, so little need be said about this matter. The main thing is: get a name selected.

A good letterhead with the farm name, name of proprietor, and any specialty of his printed there-on can be obtained at a very nominal sum. Arrangement of this printed matter should be made to conform with the system used by any of the better business firms. Envelopes should have the farm name and address printed in upper left hand corner.

A typewriter is an absolute necessity to a farmer who has much business correspondence to take care of. It makes your letters look business like and will command better attention than hand written material. You will find that a good up-to-date typewriter will prove far more satisfactory, than some old antiquated typewriter which some one has worn out. Use the same care in selecting a typewriter as you would in selecting an automobile and you'll not go far wrong.—RALPH CARMICHEAL.

Home extension clubs in 38 South Dakota counties have decided to study music appreciation as a part of their program for the coming year.

Just David

(Continued from Page 22)

weren't sunny, you know. And she said she wouldn't have any hours to count; that the sun never shone for her."

"Why, David," demurred Mr. Jack in a voice that shook a little, "are you sure? Did she say just that? You—you must be mistaken—when she has—has everything to make her happy."

"I wasn't, because I said that same thing to her myself—afterwards. And then I told her—when I found out myself, you know—about its being what was inside of you, after all, that counted; and then is when I asked her if she couldn't think of something nice that was going to happen to her sometime."

"Well, what did she say?"

"She shook her head, and said 'No.' Then she looked away, and her eyes got soft and dark like little pools in the brooks where the water stops to rest. And she said she had hoped once that this something would happen; but that it hadn't and that it would take something more than thinking to bring it. And I know now what she meant, because thinking isn't all that counts, is it?"

Mr. Jack did not answer. He had risen to his feet, and was pacing restlessly up and down the veranda. Once or twice he turned his eyes toward the towers of Sunnycrest, and David noticed that there was a new look on his face. Very soon, however, the old tiredness came back to his eyes, and he dropped into his seat again, muttering "Fool! of course it couldn't be—that!"

"Be what?" asked David.

HANDY ANDY Says "Here's How"

To Produce Hatchable Eggs

By Ray Inman

THREE ESSENTIAL REQUIREMENTS TO PRODUCING HATCHABLE EGGS:

GREEN FEED: Feed that grew in sunlight and is green in color. Alfalfa is the best winter green feed.

SUNLIGHT: During winter when sunlight is scarce, COD LIVER OIL is the only substitute.

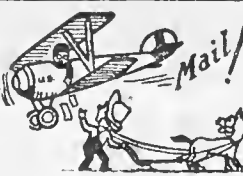

MILK: Milk in some form is essential to production of good healthy chicks...

The Service Bureau

A Department Devoted to the Interests, Welfare and Protection of A. A. Readers

“A Pig in a Poke”

The other day we received a letter from M. A. Winzen of St. Louis. Mr. Winzen said that he was not sure of our address but that he had a package for us which he would forward on receipt of \$2. The letter reached us all right so we are wondering why he did not send the package, too. Can you tell us if this is a legitimate proposition?

WE wrote to the St. Louis Better Business Bureau and they have replied that they had no information on Mr. Winzen. Later, they wrote us stating that it was a debtor tracing service used by a firm in St. Louis, Mo. They have been sending the package when the requested information was received. Although we have no information as to the value of the package, it would seem to us that anyone would be foolish to send \$2.00 on the chance of getting something that would be useful to him. The St. Louis Better Business Bureau tells us they have been advised that this debtor tracing service is continuing its scheme.

Ivory Novelty Company
Barred from Mail

DURING the last year, inquiries by the dozen came to American Agriculturist, regarding the Ivory Novelty Company, and we advised readers that it appeared to be another home work scheme and therefore, not to send the two dollars, which they requested for a sample necklace set (worth approximately 38c). The National Better Business Bureau issued bulletins questioning the methods of the company. The readers were promised three dollars per dozen for stringing necklaces. However,

many who sent two dollars received nothing in return nor was their remittance refunded.

The result is that Herman G. Essman and his wife, Rose, who comprised the company, have had a postal fraud order issued against them by the post office. At the time the postal fraud order was issued against them, they were receiving more than 200 pieces of mail daily.

Bad Investments

IT is estimated that investors lost over fifty-five million dollars in stock of fraudulent companies prosecuted by the New York State Attorney General in 1930. Less than three and a quarter million dollars of this amount was salvaged for investors. The rest was a total loss.

At least as much, and probably more, was lost or will be lost in highly speculative investments which are not actually fraudulent. Remember that when you buy stock you are betting that the company will conduct a profitable business and be able to return you a dividend on your stock and eventually to repay you the full amount, or at least to so conduct the business that you can sell your stock should you desire to do so.

If the company is conducted honestly you have no recourse even though they go bankrupt without making a cent of profit. For that matter, what help will it be to you to have them arrested and imprisoned should they prove fraudulent? In most cases you will not get your money back.

A NEW WAY OF MILKING
that proved to be a BETTER WAY

because
MILK
TRAVELS . .
ONLY 4 inches
FROM TEAT
TO PAIL . . .

FIVE YEARS AGO, farmers had never seen or heard of such a thing! But this new system appealed to their practical common sense. So thousands bought this new Surge Milker.

It went onto farms where other milkers had been used and discarded. It began milking Champions of all breeds. It won its way into fluid milk districts where milkers had been barred. Certified and grade “A” producers flocked to this new Surge Method. And so it went!

Until the new way of milking became recognized as the better way.

The whole interesting story is told in the new book we have to send you. It tells how this milker TUGS like the calf; how we got rid of the long milk tubes and how you can have a Surge NOW and pay a little each month out of your milk checks. It also tells how you can watch the Surge operate in your own barn . . . on your own cows. Use the coupon below and check for any other books you may want.

250 PRIZES

for "Way-Back" Memories

Here's your chance to win two pairs of Ball-Band rubber footwear—your own selection. 200 pairs will be given for the best letters of early experiences with Ball-Band. 50 additional pairs will be given for the best photographs taken on the farm twenty or more years ago. Search your memory—and the family album—for a prize winning letter and picture. This offer expires Mar. 31, 1931. Tear off the Red Ball trade-mark below and send it in with your letter. All pictures returned if requested.

Can you recall when you *first* gave Ball-Band Footwear a trial?

THIRTY years ago, the Red Ball trade-mark on a pair of boots was "new". But it was not long a stranger on the farm . . . For today more than ten million of you buy Ball-Band footwear from over 70,000 dealers in this country!

Can you remember the early days when you gave these "new" boots a try? Did you learn that the Red Ball trade-mark stands for *more days wear* and *built-to-the-foot comfort* from your father—or for yourself?

We like to hear from our old friends.

Write us a prize-winning letter of your "way-back" memories of Ball-Band. Look through the family album and search among "odds and ends" in the attic for snap-shots taken twenty or more years ago. Special prizes will be given for the most interesting pictures of the early days.

Year after year our skilled craftsmen have met your footwear needs with better quality at always reasonable prices. Today, the Red Ball trade-mark brings you that *natural, light-on-the-foot* feeling you want in modern footwear. Yet the live, tough rubber in Ball-Band foot-

wear will wear longer than it's reasonable to expect.

We prepare rubber for but one purpose—the making of quality footwear. And we've developed many special compounds—for the heel, for the sole, for the toe and so on. The stout linings and fabrics you see in Ball-Band are knit in our own factory. Each part, rubber or fabric, is perfected for the particular job it must do; each adds to that *plus* wear you have learned to expect of Ball-Band.

Your entire family's needs are cared for by our full line of over 800 items, including Mishko-sole leather work shoes. There's a Ball-Band dealer near you. If you do not know his name, write us. And remember to look for the Red Ball trade-mark.

MISHAWAKA RUBBER & WOOLEN MFG. CO.

482 Water St., Mishawaka, Indiana

Choose the boots that fit your needs—short boots, hip boots, red boots, white boots, sport boots or the 3-Buckle Walton giving "boot protection with shoe comfort."

The Ball-Band Double White Sole Sanslip is especially popular because the extra heavy vamp and double white sole give a double share of *more days wear*.

Treat 'Em Rough

—for Ball-Band Arctics are built to welcome punishment. Reinforced at every point with live, tough rubber, these Arctics will give you the long wear you have a right to expect of Ball-Band. There are snug fitting cloth Arctics for cold and snow, and all-rubber styles for mud and wet.

New Day Styles— Old Time Quality

Styled-to-the-shoe by our Style Committee, our Savoy all-rubber galoshes combine lightest weight and newest style with complete protection.

Flowers Satisfy the Soul

One Satisfaction Which Country People Can Have in Abundance

By MRS. GRACE WATKINS HUCKETT
Household Editor, *American Agriculturist*

THE very earliest harbingers of spring, preceding even the little song-sparrows, are with us already. They are the garden and flower seed catalogs, no less. And every ardent flower "fan" does just what I do, feasts her eyes and her soul and gives free rein to her imagination as she sees those gorgeous, pictured flower faces nodding and smiling in her own dooryard.

I can hardly wait for the warm days to come in order to see how my flower friends have stood the winter. They are quietly resting out there now under their blanket of strawy manure and I do so much want to know whether the pesky field mice have found my choice roots or whether that first cold spell was too much for them before the mulch was put on. But that is one of the charms of flower growing; we never are quite sure whether our plans will work out as intended.

But of this I can feel fairly certain; the first warm days will bring up some green shoots from my treasured bulbs, and a little later the old standby hardy perennials will begin to show life. For perennials are the backbone of any flower garden. It takes a little time and patience, probably until the second season, to bring them into full flower, but it is most satisfying to have the old reliables out there, all set to go, before the weather is fit for planting or transplanting annuals. That is one lovely thing about old Mother Nature; she is quietly doing her work and getting things ready to grow, even though from the outside they seem almost lifeless.

For those who are starting perennial beds or borders, it is well to study lists of the hardy ones which bloom at different seasons and to select from those such varieties as are adapted to the location. The height of the plant when grown and the color of its bloom need prime consideration. Furthermore, it makes a difference in final effect as to whether the foliage is lacy or is stiff, whether tall and slender or spreading and bunchy. Only a few perennials bloom from June to frost. These are the plummy bleeding-heart, some varieties of larkspur, gaillardia, and possibly coreopsis.

Some require fall planting, such as peony, iris, oriental poppy, and the Holland bulbs, but most perennials are planted in spring. Peonies, iris and phlox should be propagated by dividing roots, as their seed may not run true to color. Early start for seed, February if possible, may bring bloom the first year; otherwise; if planted outdoors at normal time, bloom is rarely to be expected before the second season. (Continued on Page 2)

Guaranteed to Build HUSKIER CHICKS

TESTS on our own experimental farm and by thousands of practical poultrymen prove that B-B *Vitamized* All-Mash Chick Starter Ration gives maximum chick growth with minimum mortality and low feed costs.

The Growth and Vigor Vitamins A and B, the Sunshine Vitamin D, all so necessary to chick life and development are contained in ample quantity in B-B *Vitamized* All-Mash Chick Starter Ration through such health-giving ingredients as Milk Sugar Feed, Cod Liver Oil, Dried Buttermilk, Alfalfa, Leaf Meal, Linseed Oil Meal, Meat Meal, Fish Meal and other health-providing concentrates and minerals, all in perfect balance.

Stronger Chicks, Fewer Losses

Poultrymen are particularly enthusiastic about B-B *Vitamized* All-Mash Chick Starter Ration because it contains everything necessary to chick health and growth. No other feed is needed. This remarkable ration will build strong, vigorous frames and give perfect feather development. You will lose fewer birds. And best of all, you will accomplish this at a

considerable saving in labor, time and money.

To prove that B-B *Vitamized* All-Mash Chick Starter Ration will give you best results, we make this offer. Get a supply from your dealer. Feed it to a part of your hatch and compare with anything else you choose to use for the balance. If B-B doesn't produce sturdier, better-feathered chicks, if it doesn't eliminate rickets and cut mortality rate, return the empty bags to your dealer and he'll give you back every cent of your money.

With all their remarkable productiveness, B-B Feeds are *surprisingly low in price*. We also have Chick Starter and Chick Feed separate for those who still prefer feeding this way. These feeds also carry the famous B-B guarantee.

Valuable Poultry Book Free

Right now, with another poultry season just ahead, you will find our free 64-page book, "Making Poultry Pay a Profit," particularly useful. Practical poultrymen tell us they have never seen so much sound information packed into one book before. We would like to send you a copy free. Your name on a postal will bring it promptly.

MARITIME MILLING CO., INC.
Buffalo, N. Y. M-163

B-B Guaranteed Feeds also include Vitamized Laying Mash, Vitamized Broiler and Growing Ration, Scratch Feeds and a full line of Dairy Feeds.

B-B COCCIDIOSIS VITAMIZED CONTROL MASH

The dreaded Coccidia germ usually makes its appearance while a chick is from 3 weeks to 6 weeks of age. B-B Coccidiosis *Vitamized* Control Mash has been prepared for use at this period to furnish the chick with the necessary combating organisms.

In addition to all needed nourishment, B-B Coccidiosis *Vitamized* Control Mash contains 40% Lactose, derived from the large quantities of Milk Sugar Feed and Dried Buttermilk. The very high percentage of this disease-fighting element forms lactic acid and develops immense quantities of beneficial bacteria in the lower intestines and caeca, right where these guardians of health are needed to wage a successful fight against the Coccidia germs.

Flowers Satisfy the Soul

(Continued from Page 1)

For early spring flowering, April to May, one could choose from Alyssum saxatile (golden-tuft), the rock-cresses, English daisy, phlox, snow-in-summer, spring beauty, valley lilies, bleeding-heart, leopards bane, dog-tooth violet, euphorbia, sneezeweed, lemon day-lily, bluebells, forget-me-not, English primrose, rock soapwort, stone crop, globe-flower, and periwinkle.

Early summer brings the handsome anchusa, columbine, shasta daisy, iris, peony, golden marguerite, false indigo, mountain cornflower, painted daisy or pyrethrum, dianthus, clematis recta, coreopsis, gasplant, globe thistle, fleabane, cranesbill, certain varieties of phlox, baby's breath, coral bells, madonna lily, larkspur, lupine, lychnis, loosestrife, penstemon, valerian, meadow rue, garden heliotrope, veronica, and Adam's needle.

In July to August we see pink yarrow, sneezewort, butterfly-weed, phlox, plume poppy, rudbeckia, carpathian hare-bell, gaillardia, cranesbill, tawny day lily, plantain lily, perennial pea, sea-lavender, flax, loosestrife, bee balm, false dragonhead, balloon flower, cone flower, violet sage, tufted pansy, and veronica longifolia.

But the hardest time of all to have bloom in the garden is the fall. Spring and early summer bring a wealth to select from, but it takes management to have a fall garden full of bloom. Here are those perennials blooming from August to October: aster or Michaelmas daisy, chrysanthemum, azure monkshood, Japanese anemone, Arctic daisy, giant daisy, mugwort, boltonia, wild senna, blue leadwort, turtlehead, mist-flower, Helen's flower, sunflower, rose mallow, bush clover, cardinal-flower, blue lobelia, fleece-flower, showy cone-flower, azure sage, showy sedum and goldenrod.

One authority has selected what he considers the twelve best perennials for beginners to grow in this climate; they are Japanese windflower, hollyhock, larkspur, peony, Iris, phlox, scotch pink, Bell-flower, Michaelmas daisy, columbine, golden glow and balloon flower.

But even the best selection of bulbs and perennials should be supplemented by annuals to fill in the periods when bloom is scarce and for cutting for the house. Some of the annuals are tender and have to be planted after the danger from frost is past. Most annuals, however, are planted as soon as the ground can be worked. Among the most useful of the annual flowers are china aster, pansy, phlox, cosmos, sweet alyssum, petunia, verbena, marigold, snap dragon, bachelor's-button zinnia, sweet scabios, nasturtium and larkspur.

In deciding which annuals will be chosen, the fact that some may be transplanted while others do not stand transplanting ought to be considered. Those which do best if sown where they are to stay are sand-verbena, anchusa or cape bugloss, prickly poppy, satin-flower, lychnis, Grecian stock, blue laceflower, striped maize. All others may be planted outdoors, but will bloom earlier and longer if started in a hotbed or window-garden in March or early April.

Naturally if one wants earlier bloom from annuals, they may be started in flats or pots indoors and then transplanted outdoors as soon as frosty nights are over. The somewhat tender ones are ageratum, arcototis, annual chrysanthemum, balsam, lobelia, feverfew, stocks, nicotiana, mignonette, salpiglossis, scabiosa, marigold and verbena.

Perhaps the most popular flower for the home garden is the gladiolus. It is easy to grow, is not expensive, has a long blooming season and makes an excellent cut-flower. It may be grown from seed, but will not run true to color this way because it is a hybrid which has been developed from various original species. The bulbs, corms they are called, and the little cormels which will not bloom the first season, are planted from early spring until the end of June. This insures a succession of bloom. The corms should be

(Continued on Page 14)

More Trees for New York

How the Hewitt Reforestation Amendment Will Do It

EDITOR'S NOTE—The following talk was given on Thursday of Farm and Home Week by Governor Roosevelt. The Hewitt Reforestation Amendment will probably be up for your vote next fall. It is of vast importance and the information given in the talk will help you to inform yourself as to its provisions.

IN speaking to this great group of farmers from all the corners of New York State and representing every branch and phase of farming, I appreciate that I am addressing a group that is primarily interested in country life, the life of the open, of natural things, both plant and animal.

I want to talk with you, therefore, about some problems of conservation, of the saving, the protection, the enrichment and the building up of our natural resources, not only for ourselves but much more for the generations that are to come.

I am particularly happy in presenting this to you, as this group and this College of Agriculture have time after time reminded me of the need for one great conservation measure in the solution of the problems of the abandoned farm region—namely the purchase and reforestation of the land by State or county.

A Balanced Program of Conservation

We need to keep in mind, also, that reforestation may carry with it a balanced program of conservation, including the development of game, wild life and recreation.

Did you ever stop to think how fortunate New York is in having in a place easily accessible for its vast population of 13,000,000 human beings that great Adirondack group of mountains one-hundred miles square and containing lakes, streams, woods and animals, a playground for all of us and for many millions more from other

By FRANKLIN D. ROOSEVELT,
Governor of New York State

states. In still another corner of the State, we have the Catskills, nearly as large in extent and just as beautiful. These are priceless heritages of the people of the State.

Now we have before us three proposed Constitutional amendments and one proposed law which the Legislature is considering and which deal with the Adirondack and Catskill mountains and with reforestation in general. One of these amendments and the proposed law, I believe, should pass. I am not so sure of the other two amendments. I want to discuss all of them with you.

What the Hewitt Amendment Proposes

The first proposed amendment is one which is recommended by the New York State Reforestation Commission—the so-called Hewitt Reforestation amendment. This has two purposes: First, to set up a schedule of annual appropriations required to put into effect the enlarged reforestation program; and, second, to provide for extending that program to all of the counties of the State where idle land is located. The reforestation program as recommended by the Conservation Department and approved by the Reforestation Commission calls for the purchase and reforestation by the State of 1,000,000 acres within fifteen years at a cost of \$20,000,000. Lands best suited for this purpose are located in nearly all of the up-state counties and 45,000 acres have already been acquired in thirteen counties. This proposed Constitutional amendment should be passed by the Legislature and should be approved by the people next fall. It is the basis for all the work that should be done

in getting these abandoned farm lands out of agriculture and put to the use for which they are best adapted—raising crops of trees.

This amendment also makes it possible for the State to start production forests in the Forest Preserve counties, but outside the Adirondack Park boundary commonly called the blue line. It does not endanger the Adirondack Park in any way or make it possible to lumber any State forests that are inside the blue line or that have been acquired up to this time in the Adirondack Preserve counties, but outside the blue line. Unless this amendment is passed, it will be impossible, for instance, to start production forests even in the southern end of Herkimer County simply because that county contains within its northern border a small part of the Adirondack Park and is therefore technically a Forest Preserve county.

Other Amendments

There are two other proposed amendments which I want to mention. One of these would make it possible to build new highways through the Forest Preserve, destroying timber and forest growth for this purpose. The other would make it possible to develop great recreation centers in the Adirondack and Catskill Parks by cutting trees, etc. At first reading these do not look harmful. When we recall the struggle that the people of the State have had to prevent exploitation of the Forest Preserve by unscrupulous persons, and the great advantages to us and our descendants of having these great preserves kept as nearly as possible in their natural condition, I am doubtful of the wisdom of too hasty action on these two amendments.

I believe that it is unwise to vote upon these
(Continued on Page 12)

No Purses from Sows' Ears

Grading Cannot Change Poor Potatoes to Good Ones

By H. DEANE PHILLIPS,

N. Y. S. Department of Agriculture and Markets

IT is frequently said that "New York potatoes are losing out because they are not well graded." I believe this statement needs some qualification as regards both its major and minor premise.

In the first place it is at least doubtful whether it applies to Long Island where acreage has certainly been increasing and where the potatoes produced have managed, except during the last year or so, to hold a premium place in the markets. Long Island produces about one-fourth of the total state crop and ships more potatoes in carlots than all the rest of the state combined.

For the state as a whole, statistics show a very striking decline in carlot shipments of potatoes, but increased movement by motor truck certainly accounts for much of this apparent decline.

The acreage of potatoes in the state since 1905 also shows a steady decline, but this has gone hand-in-hand with an increase in production per acre. The net result is to show no very startling—and certainly no very uniform, except for a few recent years—decrease in total production when due allowance is made for seasonal ups and downs.

The truth of the matter seems to be that potato production on the whole is declining in New York State, but that we are no where near in such danger of being eliminated from the picture as we have lately been led to believe.

Where high yields per acre of good merchantable potatoes can be obtained at low cost, there potatoes will continue to be raised in increasing quantities. Spending money on sort-

ing and grading low-production-per-acre potatoes, of poor quality and carelessly harvested, is quite futile as a means of stopping the steady shift which is taking place in production to areas where potatoes can be grown cheaply and marketed without excessive grading costs.

Grading Not the Only Factor

At the present time, Maine is our most feared competitor, and Maine potatoes are the ones most often mentioned as driving our own potatoes out of the markets.

But, to attribute Maine's success to careful

grading is hardly correct; to present it as an argument for passing a compulsory branding or grading law in New York State is beside the point, for Maine has no such law. The real reasons for Maine's success are of another sort.

On the average, Maine produces one and one-half as many potatoes as New York. According to the lists published by the standard Produce Rating Agencies there are about 415 carlot shippers of potatoes in Maine and approximately 750 in New York State. In making a comparison due allowance must be made for the fact that these lists include, especially in the case of New York State, a considerable number of occasional or "one-car" shippers. Offsetting this, however, is the large quantity of New York potatoes moved to market by motor truck by farmers and by trucker—dealers not included in the lists mentioned.

This massing of the entire Maine crop in the hands of a comparatively small number of shippers gives a tremendous advantage in the markets in these days of the chain store and other modern market developments.

However, the basic factor in Maine's success is of another sort. It is, that she produces potatoes, mostly of one variety, of uniformly good quality to start with. This, combined with the concentration of shipments and the fact that a considerable percentage of the Maine crop is inspected and certified as to grade by Federal-State inspectors prior to shipment all makes for uniformity in the product when placed on the market.

This inspection and certification at shipping-point is a service operated
(Continued on Page 17)

As Mr. Phillips indicates, the first step in marketing is to produce a high quality product. Spraying is essential for quality. This outfit shows the sprayer and the spray mixing outfit on the farm of Harold Simonson of Nassau County, Long Island.

Master Farmers Awarded

IF we ever had any doubts about all the hard work and expense necessary to locate master farmers and to award them with the honor at a banquet, these doubts were again all swept away at the splendid occasion on February 12th at Farm and Home Week when the Class of 1930 received the Master Farmer award from Governor Roosevelt's hands. Read Mr. Cosline's full account of the ceremonies on the next page.

The Master Farmer work is the most interesting job with which we have ever been connected. Everyone who has watched its growth in the nation and in New York is beginning to recognize its fundamental object, which is not so much to honor individuals as it is to emphasize what a great trade farming is and that a satisfactory life can be lived on a farm.

The 4-A awards for young people this year were also impressive. Without doubt, there are master farmers and boys and girls better qualified for the awards than the particular candidates who were chosen. That is not the right idea. The real thought and real purpose is to show that it is just as possible to reach true success and happiness and to achieve real greatness on the farm as it is anywhere.

Those who saw the splendid Master Farmers and their wives stand before the Governor of their State, so shaken with emotion they could hardly talk, were very proud of an occupation that can put forth so many men and women successful, not only materially, but as citizens and home makers.

Snow-Bound

WE have just returned from several days spent in the country and our chief impression is the amount of snow that now covers most of the A.A. country. In many sections of the north and east this is the old-fashioned winter that the old timers tell about. It is not so bad on the main roads, which are kept open by the highway authorities, but there are thousands of farmers who live where it takes a tremendous effort this winter to get off from the farm for any purpose, however necessary, and except for the telephone and the radio, some of our friends have been snow-bound about as much as many of our forefathers were in pioneer days.

Yet with all of the disadvantages of not being able to get to market and of fighting the snow

and the cold weather, there are, to one who loves the country, some good things about a real old-time winter. For example, modern life tends to scatter and take the family, even on the farm, away from home more than it once did. We do not read as much of the good classics or gather as much in the family circle around the hearthstone as our fathers did, so from this standpoint possibly it would do no harm to have a winter occasionally when we are at least partly snow-bound.

No finer poem of life on the farm in winter has been written than the one by Whittier which he calls "Snow-Bound." All of you have read it, possibly back in school days. Maybe the little selection from it that follows will be enough to encourage all of you to gather around your fires on these winter evenings and read out loud the whole of this fine old poem of American farm life.

*Meanwhile we did our nightly chores—
Brought in the wood from out of doors,
Littered the stalls, and from the mows
Raked down the herd's-grass for the cows;
Heard the horse whinnying for his corn;
And, sharply clashing horn on horn,
Impatient down the stanchion rows
The cattle shake their walnut bows;
While, peering from his early perch
Upon the scaffold's pole of birch,
The cock his crested helmet bent
And down his querulous challenge sent.*

* * * * *

*Shut in from all the world without,
We sat the clean-winged hearth about,
Content to let the north-wind roar
In baffled rage at pane and door;
While the red logs before us beat
The frost-line back with tropic heat;
And ever, when a louder blast
Shook beam and rafter as it passed,
The merrier up its roaring draught
The great throat of the Chimney laughed.*

Brigham Oleo Bill Should Pass

A FRIEND of ours, who is also a most sincere friend of agriculture and who does much for farmers and farming, recently wrote us objecting to our editorials against the use of oleomargarine. He said that farmers want no special privileges and that if butter cannot stand on its own merits, it should have no special help.

Our friend is right. Farmers want no special help, providing the other fellow has no such help. You remember the old story of the man who got in a fight with a bear. He had not prayed before in twenty years, but the bear was getting the best of the argument so he began to ask the Lord for help. He realized that he did not have much right to call upon the Lord, so he concluded his prayer as follows: "But if you can't help me, Lord, please don't help the bear!" So it is with the dairyman and his fight with the oleo manufacturers.

Nearly all of the different brands of oleo would be white or a sickly yellow if they were not artificially colored. The manufacturer well knows that he could not sell his oleo unless it was colored to imitate butter. In other words, oleomargarine cannot stand on its own feet. Therefore, the farmer has a right to ask that his butter, which is a better product, be protected from imitation and that the consumer shall not be fooled in buying something that looks like butter but most decidedly is not.

Lately the Commissioner of Internal Revenue has granted oleo manufacturers the privilege of using certain colored cooking fats, namely palm oil and soy bean oil in the manufacture of oleo, so as to make it look like butter, without paying the usual ten-cent tax. Dairy men feel that this means that the Government is failing to give butter an equal chance, is helping the bear, in other words.

In order to meet this new situation made possible by the removal of this oleo tax, a bill known as the Brigham Oleomargarine Bill has been introduced into both the houses of Congress in Washington, taxing all margarine ten cents a pound containing more than 1.6 degrees of color. If this bill is passed, it will keep oleo from imi-

tating butter and will protect the dairy industry. The farm organizations of New York sent representatives to Washington to appear at the hearings in favor of this bill, and a strong effort has been made in many different ways by the organized farmers of the entire country to secure passage of the Brigham bill.

At this writing its passage is still very much in doubt. Therefore, here is another place where you could probably help. If it is not too late when you read this, a telegram by you addressed to your representative in Congress or to the Honorable B. S. Snell, House of Representatives, Washington, may do a lot of good.

Why Go To Extremes?

"This is probably the worst world depression that has ever occurred—probably the worst depression America has ever experienced . . ."

"The depression of 1920-21 was probably more serious for agriculture as a whole than this depression, but this depression is more serious in the cities . . ."

"We must get used to a generally lower price level, even after the depression is over . . ."

"About the only cure for these ups and downs in a business world is education which will help us to find some way to be less optimistic when we are optimistic and less pessimistic when we are pessimistic, less like sheep and more like men."

THE above quotations are taken from the last issue of "Farm Economics" written by Professors Warren and Pearson of the New York State College of Agriculture, and also from recent speeches by Professor Warren. We think you will agree that they are just plain common sense at a time when common sense and sane-thinking are more needed than anything else.

Just a day or two ago we overheard two men loudly discussing the hard times in a smoking car. Both agreed in very positive statements that the world was going to the "bow-wows", that all public officials were rascals and grafters, that the government was to blame for the present depression, and that we would never again see good times in this country. This conversation was carried on so long that we were thoroughly glad when we came to our station and could get off.

These are just the kind of individuals who were just as positive a short time ago that the good times were going to last forever. They are the kind of people who help cause panics, and who by their loud bleating prolong depressions. As Professor Warren says these are the ones who are too optimistic in good times and too pessimistic in bad.

Now, of course, these *are* hard, sad times. Farmers have a difficult year ahead, but they have had other difficult years. They know that better times will come again. Therefore the majority of them are studying and planning as never before to meet the situation as it is, and they are wasting little breath shouting in public places about it.

Eastman's Chestnut

THE following may not be much of a joke, but it amused me very much.

A friend and myself were riding up the long, steep hill in Ithaca with our friend, Curry Weatherby, circulation manager of AMERICAN AGRICULTURIST. Curry had just gotten a brand new car of rather expensive make, and was very proudly demonstrating its great power in going up the hill, and boasting about it in no uncertain terms.

"See how it rides. Here, I'll go fast over this bump . . . you see, it does not jounce you at all. But, boys, I tell you there is not a car on the market that has the power to pick up speed like this one does. Now you just watch me as I go up this long Ithaca hill . . . There is not a car on the market that can pass this anywhere, and especially on a steep hill like this one . . ."

Just then, a brand new little road-bug about half as big as our car, came up behind, honked once, pulled out, passed by us, and in a minute was over the hill and out of sight.

Curry watched it sadly for a moment, and changed the subject.

Eleven Master Farmers Honored

Young Folks Also Recognized at Farmers' Week Ceremony

By H. L. COSLINE,

Associate Editor, American Agriculturist

FOR the past two years the annual American Agriculturist Master Farmer banquet has been held in New York City. This year, after careful consideration, it was decided to have it during Farmers' Week at Cornell University and the enthusiasm with which the event was received demonstrated that the choice was a happy one. The facilities at the Willard Straight hall limited the crowd to three hundred and twenty-five persons but all through the day of the banquet requests poured in for tickets until those disposing of them declared in all seriousness that, had the space been available, they could easily have sold a thousand tickets. In order to give to as many as possible the opportunity to hear the actual presentations, one hundred special tickets were distributed which gave the privilege of coming into the hall as soon as the banquet was finished in order to hear the actual presentation ceremony.

The Governor arrived promptly at 6:30 and walked from the doorway of the Willard Straight to the banquet room between a guard of honor composed of two lines of uniformed students, members of the Reserve Officers' Training Corps. As soon as the Governor and guests were seated, Dean Mann of the State College, who unfortunately had to leave early, gave a few words of welcome, and expressed the satisfaction which the University and the State College of Agriculture had in acting as host for the Master Farmer banquet.

President Farrand Welcomes Guests

After the banquet was finished, Henry Morgenthau, Jr., Conservation Commissioner and publisher of American Agriculturist, who acted as toastmaster, introduced Dr. Livingston Farrand, president of the University. Dr. Farrand declared that the Master Farmer idea had fired his imagination with its possibilities. "It is good for the University," said Dr. Farrand, "to have the various State Colleges here, and we believe it is also a good thing for the State Colleges to be a part of the University. It is our aim to maintain the colleges in the best possible manner to prepare students in a broad manner for leadership. The Master Farmer movement recognizes the same ideals that the University is trying to foster. It is good to have groups such as this here, and we are happy to welcome you all."

The toastmaster then introduced E. R. Eastman, editor of American

Agriculturist, who spoke on, "What Is A Master Farmer?" Mr. Eastman explained first how Master Farmer nominations are sent in by neighbors, how work sheets are sent to nominees, and how, after these are returned and carefully studied, a certain number are chosen to receive personal visits from a representative of the Board of Judges. Information is gathered in other ways also, all of which is presented to the Board of Judges who choose the men to receive the honor.

James Roe Stevenson, Master Farmer of the Class of 1928, then spoke on "What It Means to Be A Master Farmer." After pointing out that there are many men who qualify as Master Farmers who have not yet been named, he characterized a Master Farmer as a man who makes adjustments to meet changing conditions. "The Master Farmer," he said, "is young in spirit, must be always able and willing to learn, must be willing to see that his children go further in school than he himself did, and in addition to this, must be willing to help his neighbors."

"Greetings"

On the program six men were listed to give "greetings" to the guests. Mr. Morgenthau, in introducing them, said he had asked Mr. Eastman what the word "greetings" covered, and Mr. Eastman had replied, "Something that does not take over three minutes." Those who gave "greetings" were: Berne A. Pycke, commissioner, Department of Agriculture and Markets; Frank M. Smith, chairman, Assembly Committee on Agriculture; Leigh G. Kirkland, chairman, Senate Committee on Agriculture; Fred J. Freestone, master, New York State Grange; and Albert R. Mann, dean, State College of Agriculture. Dr. Frank P. Graves, commissioner, Department of Education, was unable to attend.

From a Master Farmer's Wife

A delightful new feature on the program which was thoroughly enjoyed by all was a talk on "What It Means to Be A Master Farmer's Wife" by Mrs. Henry Marquart, whose husband received the honor a year ago. Mrs. Marquart, told the wives of the Master Farmers of 1930 that from now on, although the hours will be no shorter and their tasks no lighter, they will have a fuller realization that the job is worth the cost. "I am proud of my

husband," said Mrs. Marquart, "and proud to belong to a farm family."

Later in the evening when the young winners of the 4-A awards came before the Governor, there was an atmosphere of real inspiration. The idea of honoring these organizations by recognizing outstanding achievement of some of their members is, so far as we know, something which has not been done before, at least not in this way. The idea itself is new, and perhaps some of those who attended the banquet were not thoroughly familiar with the plan.

What the 4-A Award Signifies

As a part of the speaking program, before the awards were given, three men who are vitally interested in the organizations gave a few words on what the 4-A awards will mean to the young folks. James E. West, chief Scout executive of the Boy Scouts of America, told "What the 4-A Award Means to Rural Scouts"; Arthur K. Getman, of the State Department of Education, who has charge of vocational work in agriculture, told "What the 4-A Awards Means to Young Farmers' Clubs"; and W. J. Wright, State leader of 4-H Club work, told "What the 4-A Award Means to the 4-H Clubs."

At the speakers' table, in addition to those on the program, were: C. R. White, president of the State Farm Bureau Federation; Dr. U. P. Hedrick, director of the Geneva Experimental Station; Albert Schillroth, president of the New York State Vegetable Growers Association; M. C. Burritt, Master Farmer of the Class of 1928 and now Public Service Commissioner; Guernsey Cross, secretary to Governor Roosevelt; Fred Porter, president of the G. L. F.; J. L. Salisbury, vice-president of the State Horticultural Society and Master Farmer of the Class of 1929; and E. C. Weatherby, circulation manager of American Agriculturist.

Governor Roosevelt personally presented the Master Farmer medals for the third consecutive year, and many who attended this year's affair as well as the others mentioned that the Governor always seems thoroughly to enjoy the occasion.

In his talk before presenting the medals, the Governor remarked that he was very happy to come to this ceremony which he spoke of as "the third commencement," and referred to farming as one of the most important

"graduate schools." "The Master Farmer movement," he said, "is vitally related to the future of 13,000,000 folks in New York State."

Someone once said that agriculture is one of the basic industries, but Governor Roosevelt went even further and said that agriculture is *the* basic industry not only in New York State but in the entire United States, and for that matter in all countries, and that those who have succeeded in agriculture should rightly get some recognition.

As most of our readers know, Governor Roosevelt spends some time each year in Georgia and he spoke of his observations on the Master Farmer movement there. It sometimes seems that the South has not progressed in agricultural development quite as rapidly as some northern states, but in Georgia there is one Master Farmer, who is the only one within a radius of six or seven counties. Literally hundreds of neighbors, stated the Governor, have traveled to this man's farm to learn how and why he became a Master Farmer. There is the same tendency in New York State, and the Master Farmer is in one sense a marked man. Folks in the neighborhood are inclined to refer to him as "the Master Farmer."

Progress Toward Solving Problems

Governor Roosevelt referred briefly to the progress that has been made in New York State in the last three years towards solving some of the problems which confront agriculture and spoke particularly of the fine co-operation among agricultural leaders, legislative leaders, the Agricultural Advisory Commission, and the executive in bringing about the development of a definite program. Looking to the future, he spoke of the development of a New York State land policy which will affect not only land in farms but every acre in the State. "Conservation is a full blood sister of agriculture, and a policy of conservation will help all parties and all interests in the State."

Governor Roosevelt is counting on the cooperation of the city population who realize, or should realize, that the prosperity of our urban population is not sufficient for the prosperity of the State as a whole. Agricultural prosperity has a definite effect on the prosperity of our cities and any progress which is made must be based on the prosperity of all the 13,000,000 people within our borders.

"This brings up the question," said
(Continued on Page 13)

A.A.'s Western New York Farm and Home Talk

Heard at Farmers' Week

By M. C. BURRITT,

STATE Grange and Farm and Home Week are again behind us. They are strenuous weeks for those with official responsibilities and for those who attend both.

M. C. Burritt

On the whole, they were well attended and encouraging. Attendance at Farm and Home Week at the State College broke the record. Certainly we ought to understand our problems and their solutions, even if we do not like them and do not do what we know

how to do. New York State farmers enjoy exceptionally capable leadership both in their farm organizations and in their State Colleges. The results of this are becoming more and more apparent in excellent relationships, sound programs and real achievements.

Irish Poet Brings Message

The Irish philosopher, "A. E." Russell, brought us some very fundamental things to think about in relation to the future of agriculture in this country. Pointing out our strong trend to pile up our population in great cities with relatively less farmers each year, and the results of this movement elsewhere in the world and in other times, he warned that the social and economic effects would be equally disastrous here. Basing his suggestions on the experience of the Irish Agricultural Organization in his own country, he recommended the control by farmers of the distribution processes, both incoming and outgoing, at least as far as the wholesaler, and of many of the manufacturing processes as well. He pointed out that this is essential for a sound rural civilization which must include the preservation of the small towns as community centers, and also for an outlet and enlarged opportunity for farm boys and girls for diversified occupations in rural industries under rural influence and environment.

Such a philosophy and experience are encouraging and go far to justify the development of some of our organization in this State. It is well to know that our background policy is sound. Upon this we must build a larger and better social and cultural life.

Doctor Warren Addresses Big Audience

As usual, crowds flocked to hear Dr. Warren, both because of the interest our situation compels us to have in economic problems and because of the wisdom and clarity of his discussions of these matters. Again we saw his charts and again we were impressed with the close paralleling of our present post war conditions with

those after the Civil War. From all the facts it is apparent that while there may be a temporary upward business swing during the next year or two, particularly in some lines, there are still three or four years of general decline ahead. Many commodities have not yet reached a comparable level which must be the starting point of permanent improvement. In agriculture, the encouragement lies not so much in probable increases in prices as in the fact that the general price level, in coming down to the point where farm products already are, is in effect reducing the costs of farm supplies and hence costs of production.

Another outstanding fact which came out at both the State Grange and at Farm and Home Week was that the cost of distribution is practically the only cost which has not been reduced. As this cost lies between the producer and consumer and is paid by both, ways must be found to reduce it. Plans now in process of development give promise of reducing the costs of the first step in the distribution of outgoing farm products.

The Growth of Trucking

One other fact of which we are gradually becoming conscious is the tremendous changes which are coming about in the movement of produce to market. It has been estimated that nearly two-thirds of the fruits (except citrus) and vegetables are produced in the general area which include only a little more than that of the North Atlantic States, which also contain our greatest markets. It is probable that about 50 per cent of this produce is already moving to market by truck. It is further probable that at least another 25 per cent will eventually move by truck within the area. In spite of this, our market facilities remain unchanged. The truck undoubtedly means both better and more direct service to the consumer and at lower costs because it will eliminate certain middlemen's services. Fully to realize these benefits there must be marked changes in our local and terminal markets to serve better the new method of marketing by truck.—M. C. Burritt.
Hilton, New York

When to Spray

FOR the past several years much has been said about the spray service furnished in many fruit growing counties. An idea of the difficulty of determining when a spray, for instance, the delayed dormant spray, should be applied is shown by the many factors involved. For example, the timing of this spray depends on the stage of development of the scab fungus in the old leaves, weather forecasts, the development of the apple buds and the development of the apple aphids which are controlled by the nicotine in this spray.

The man in charge of the spray service is trained technically and can weigh all of these factors and determine the best possible time for planning the spray.

Railroad worms live over winter in the ground under the neglected tree by the fence. Cut it down. Sweet and early apple trees may serve as traps for maggot eggs but the drops must be picked up and destroyed. Cut down those not located where this sanitary measure may be taken.

Curculio overwinters in brush, stone walls, and the like. The removal of these hiding places will help control. You know that trees near woods are never as clean as others. A cleared area will help.

BLACKFOOT BRAND

IDAHO GRIMM
ALFALFA SEED

The Big Yield Alfalfa

Blackfoot Brand Idaho Grimm Alfalfa is an extremely hardy strain. Improved for over 20 years in the severe climate of Idaho. A strain that is not susceptible to winter killing. A big tonnage of fine stem hay every year.

Blackfoot Brand Idaho Grimm Alfalfa is grown in a restricted area where every field is registered. The Blackfoot tag shows that every bag has been sealed and certified as to variety and purity by the Idaho State Seed Certification Service. Insist on getting sealed bags labeled with the Blackfoot tag.

Two Dependable Grades

EXTRA NO. 1 (Blue Tag)—Purity 99.50%. No noxious weeds. Free of sweet clover.

NO. 1 (Red Tag)—Purity 99%. Free of noxious weeds. Not more than 1/16 of 1% sweet clover. Practically as good as the Blue Tag grade but a little lower priced.

Both grades are genuine Blackfoot Brand Idaho Grimm and state certified.

Look for the Blackfoot Tag on Every Bag!

The Blackfoot tag is evidence that the seed is genuine and true to name, having been inspected in the field, sealed at the thresher, and checked and resealed through all cleaning operations by state officials. Make sure that the Idaho Grimm Alfalfa you buy bears the Blackfoot tag.

If your local dealer cannot supply you, write us direct.

Vegetable and
Crop Grower

A New Method of Liming Sweet Clover

SWEET clover, very recently considered a weed, has grown rapidly in the favor of farmers in this country. Unlike alfalfa it lives only two years, but those two years are marked by a vigorous dense growth which makes it a pasturing and soil improvement crop par excellence.

Its long roots grow deep into the subsoil improving tilth and drainage. Plowed under in the spring of its second year it supplies each acre of soil with as high as 250 pounds of that valuable element, nitrogen. (This is equivalent to the nitrogen content of about 25 tons of barnyard manure). If sowed this spring it will furnish an abundance of high protein pasture during late summer and fall when permanent pastures are at their low ebb. The second year it may be pastured, cut for hay or turned under for green manure. It grows well on wetter and less fertile soils than is required by alfalfa. Sweet clover is critical about two things—inoculation and lime.

A good stand of this crop is not assured on any soil which is more than slightly acid. Lime, therefore, is an important requirement in its culture. However,—thanks to L. W. Kephart, Agronomist of the United States Department of Agriculture,—the liming problem has been materially simplified.

Mr. Kephart reports that sweet clover can be grown on slightly sour soils with very little lime. He suggests mixing the inoculated seed with 400 to 500 pounds of hydrated lime for each acre. The mixture is sown through the fertilizer attachment of a grain drill. In this way lime in its finest state is brought into intimate contact with the seed and becomes immediately available to the seedlings. Apparently the seedling stage is the critical time as regards lime requirement and once they become established the plant thrives.

Haul Manure Before Spring Rains

MUCH of the value of barnyard manure may be leached out if hauling to the field is delayed until after the spring rains have come. Not only is valuable plant food lost, but often the yards are made almost impassable for the cows on account of the deep mud. This results in mud-caked udders and loss of time and temper on the part of the milker. The modern spreader makes it possible to haul the manure out promptly and with a minimum of effort. At the Ohio Experiment Station eight tons of stall manure have increased the production of crops to the value of \$37.72 an acre, which shows that this by-product is worth careful handling on every farm.

Same Bacteria for Peas and Vetches

Is it necessary to inoculate vetch if it is put on a field that grew peas last year?

SOME legumes are inoculated with the same strain of bacteria. Vetches and peas are cross inoculated so it is not necessary to inoculate either of them if grown on land on which the other has been successfully grown.

When to Set Cabbage Plants

Does the time of setting out cabbage plants have any great effect upon the yield per acre of the crop?

BBETTER yields are secured when the late cabbage crop is set out not later than June 15. This is especially true when early Fall freezes occur.

Be sure to get catalogs from reliable seed dealers, and do not fail to provide for flowers as well as food crops.

Is your land hungry?

ARE the yields per acre too small to be profitable?

Armour Fertilizers make more profitable crops by producing bigger, better yields. Armour Fertilizers boost the yields per acre and quality of potatoes, corn, tobacco, fruits, truck, and canning crops. They give new life and greater value to pasture and hay lands.

Plan for larger acre yields of better quality crops this year with Armour Fertilizers. Bigger yields reduce the cost per bushel or pound and increase profits. There is an Armour Fertilizer for each crop and every soil. Ask your Armour Dealer to supply the Armour Fertilizers best suited to your soil and your crops.

With the A. A. POULTRY FARMER

Avoid Production Slumps

A SMALL poultry problem difficult to handle is that of egg slumps which apparently come without any warning, particularly during the winter months. As a matter of fact, the hens do give warning but we do not see it. The warning consists of a drop in body weight, and a well bred pullet may continue to lay even while she is losing weight. Sooner or later, however, she stops and begins to build up her own body and when she does this it requires some time to get her back into production again.

Cornell University advises that one hundred four-pound Leghorn pullets will eat from 18 to 19 pounds of feed a day before they start laying. When they begin to lay fifty per cent they will eat 24 to 25 pounds of feed a day. If they won't eat this much and continue to lay heavily it naturally follows that they must be losing body weight. Another suggestion is to weigh a certain number of pullets every week, possibly having them marked so that you can weigh the same ones and in this way tell whether or not they are maintaining their weight.

Hens Act Dizzy

Please advise me just what is the matter with my hens. They get dizzy and keep turning around, then they grow real thin, although they eat just as hearty as the other hens. Then they get blind and finally die. I would like to know what to do for them.—MRS. S. P., N. Y.

THE symptoms you describe are those usually associated with either microscopic tape worm infection in the intestines, or chronic coccidiosis, or possibly both. There is nothing in the way of treatment that proves effective in the affected individuals. You should take them away from the flock as soon as noticed. They are then marketable if they have not become thin in flesh. Kill and burn or bury those not suitable for sale.

The spread of the trouble in the rest of the flock may be controlled to some extent at least by the iodine vermicide treatment. In addition to this we suggest that you use "Enteritis Powder" in the drinking water as recommended by the Connecticut Agricultural College.

—L. E. Weaver.

Turkeys Lack Vigor

"We have been having some trouble with our turkeys. They become droopy and do not eat but they will drink water. They act this way for about a week or two then die. Could you tell us how they act if they have worms?"—L. K., N. Y.

MATURE turkeys are usually resistant to worms and are seldom troubled with them. The indications of worms are: (1) A general unthrifty condition and (2) Appearance of round worms and segments of tapeworms in the fresh droppings. The most positive test is to kill one of the sick birds, open it and slit open the intestine for 15 to 18 inches just below the gizzard. If worms are present they can usually be seen very easily.

But I am inclined to think the trouble with your turkeys is something else than worms. If you open one of the birds look at the liver. If it is spotted with yellowish mottled spots the trouble is probably blackhead. But the fact that your turkeys are thirsty but have no appetite would point toward cholera. This disease may be brought on by feeding unbalanced rations, by unfavorable weather conditions, or by overcrowded unsanitary quarters.—L. E. Weaver.

Raising Turkeys

"I would like information on how to take care and raise young turkey poult and also the feeding of them."

—L. W., New York.

OF course, I don't know whether you are raising them with hens or brooders. Anyway you must keep them

(Continued on Page 12)

Where Improvement Began

OUR first venture in cows after we came on the farm was to go out among our neighbors and buy what they considered their best individuals. I had not at that time learned that it is a failing of many farmers when they sell cows out of their herds to flatter themselves into thinking that they are parting with the cows which give most milk, hold out the longest, and put the richest milk in the pail. That was the kind of cows we wanted and it did not take much argument to convince us that this was a bonafide testimonial to the good qualities of the cows offered for sale.

Somehow, though, the cows we bought did not turn out to be as good as we expected. It made us think of the farmer who had a horse to sell. When we asked him if the animal was sound, he dropped his head and stepped around a pace or two before he answered; "I have owned a good many horses, and I never saw one that did not have something wrong with it."

One of the cows we bought was distinguished by her ability to kick. She was very handy with her hind legs and she liked to display her proficiency in that line, as I learned to my sorrow after picking myself up out of the gutter a few times. Another developed a bad case of garget; and so on around the lot. And we finally decided that buying the best cows out of the average man's herd was not the best way to get a good dairy.

Then we took another tack. We invested in some choice purebred calves and got a purebred bull to go with them. Just there we took our first lesson in stock improvement. We were beginning now at the right end of the road, and we never were sorry we did. Not that we did not have some disappointments. Accidents will happen so that calves do not mature as we expect they will. This, no doubt, is the experience of all who enter upon a course in building up good herds. It takes time, it takes patience, and it takes some money; but it is in the long run by far the most satisfactory method we know of to reach the desired result.—E. L. V.

A Fair Price for Silage

BECAUSE silage does not enter generally into trade, there is no widely accepted method of figuring its value. Such a plan would be helpful, however, since silage is one of the leading cattle feeds and is often sold in quantities to neighbors, by farmers who have a surplus.

Analyses by the dairy department of the Ohio Experiment Station show that good corn silage contains approximately one-third as many nutrients, by weight, as high grade mixed hay. In this case a fair price for silage can be computed by taking a third of the market price per ton for hay.

If the price of hay is unusually low or high, the Ohio station reports that the value of silage may be figured by allowing from four to five bushels of grain, and about 500 pounds of dry stover per ton of ensilage. This price will usually compare closely with that obtained by taking one-third the price of hay.—ROBERT A. JONES.

Feed Has Little Effect on Fat Content

Can a farmer influence the fat content of the milk of his cows by feeding the cow oily feed?

ONLY temporarily. After a short time, the milk returns to the normal composition. What is true of fat is also true of other milk substances, such as protein, carbohydrates and ash; that is, these substances in the milk cannot be increased or decreased for more than a short, temporary period by differences in feeding.

Making PASTURES Pay

THIS little publication MAKING PASTURES PAY contains just the type of information you will need to make pastures the best-paying land on your farm. Fill out the coupon and mail it to-day and we will send you your free copy.

Dairymen from Maine to Maryland have found that a good pasture fertilizer like a good potato fertilizer must contain plenty of potash.

Last season fertilized pasture produced good green feed two weeks before unfertilized pasture was fit to graze. This earlier grazing decreased feed costs and increased milk flow enough to pay for the fertilizer, before unfertilized pasture was ready to graze.

Fertilized pastures kept on producing feed after the unfertilized grass was dry and brown. In 50 tests in nine north-eastern states the average profit was

\$29.62 above the cost of fertilizer. This profit was secured by more days of good grazing—earlier in the spring and later in dry weather.

The fertilized pasture also had a thick vigorous sod at the end of the season.

It will pay you to give your pasture 600 pounds of well-balanced potato fertilizer per acre six weeks before you turn out your cows.

CLAY ALL METAL VENTILATING WINDOWS

Before remodeling or building investigate CLAY windows. Permanent — will not shrink, swell, get loose or rot out. Easy to install. Ribbed glass spreads healthful sunlight thru entire building. Styles for wood and masonry walls. Attractive appearance both inside and outside. Users say — greatest of all improvements for farm buildings in last 10 years.

Adjustable for ventilation — just pull the window back and fresh air flows towards the ceiling instead of directly across the animals. Raise window to give wide opening both top and bottom when weather is warm. Exceptionally easy to install, and inexpensive.

W. W. "Weather-Tite" window. For wood walls. Fits between studding 24" on centers. Made in two size glass, 20"x30" and 20"x36".

M. W. Series in four sizes. Ideal for tile, brick or other masonry construction. Mortar filled frame makes window permanent part of walls. Windows last as long as barn.

B. W. 20-28 "All-Purpose" window. For wood walls. Complete Sash, Frame, Glass, Wings, Clips, Adjustable latch. \$3.50

CLAY Roof Windows
All-metal, non-leakable — special drain rib and condensation gutter. Complete with 3/16" ribbed glass to diffuse and spread sunlight throughout entire building.

Cedar Falls, Ia.

Reviewing the Markets

Milk Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	1.50
2 Fluid Cream		
2A Fluid Cream	1.66	
2B Cond. Milk	1.91	
3 Evap. Cond. Milk Powder		1.50
4 Hard Cheese	1.55	
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for February 1929 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Continues Irregular

CREAMERY SALTED	Feb. 21, 1931	Feb. 14, 1931	Feb. 21, 1930
Higher than extra	29 1/2-30	29 -29 1/2	35 1/4-36
Extra (92 sc.)	29	28 1/2	-35
84-91 score	24 1/2-26 3/4	24 1/2-28 1/4	30 1/2-34 1/2
Lower Grades	23 1/2-24	23 1/2-24	28 -30

The third week in February was marked by continued irregularity in the butter market. Prices fluctuated from day to day. Under the surface, however, there was more confidence than has prevailed for some time. The publication of the Government reports showed the statistical condition of the market to be better than generally anticipated. However, the market killed the goose that laid the golden egg for they played the cards the same as on previous occasions. Just as soon as sentiment was right they started shoving up the price and by Tuesday, creamery extras had reached 30c. It was to be expected that buyers would pull out and they did, with the result that on Wednesday the market suffered a sharp slump and in one morning lost practically all of the early gains, sliding back to 28 1/2c on extras. Thursday found the market climbing back again, registering a fractional recovery. Friday the market was in better shape but on marks scoring above 92 the trade started boosting prices

Cheese Market Quiet

STATE FLATS	Feb. 21, 1931	Feb. 14, 1931	Feb. 21, 1930
Fresh Fancy	17 -18	17 -18	18 1/2-
Fresh Average			
Held Fancy	21 1/2-22 1/2	21 1/2-22 1/2	24 -26
Held Average			23

The cheese market has been quiet all during the third week of February. There has been plenty of cheap freshly made cheese from Wisconsin available that keeps the market well supplied. Fortunately, there is very little fresh New York State cheese coming forward, which keeps the balance well established. On February 19 the ten cities held 11,683,000 lbs. compared with holdings on the same day a year ago totaling 14,200,000 lbs. From February 11 to 19 holdings in the ten cities were reduced 537,000 lbs. compared with a reduction during the same period last year of 230,000 lbs.

Egg Market in Slightly Better Shape

NEARBY WHITE	Feb. 21, 1931	Feb. 14, 1931	Feb. 21, 1930
Hennery	23 1/2-25	23 -24 1/2	40-41
Selected Extras	22 -22 1/2	21 1/2-22	-39
Average Extras	21 -21 1/2	20 -21	
Firsts	20 -20 1/2	19 -19 1/2	
Undergrades			
Pullets			
Pewees			
NEARBY BROWNS	Feb. 21, 1931	Feb. 14, 1931	Feb. 21, 1930
Hennery	21 -23 1/2	20 -23 1/2	40-
Gathered	18 -20 1/4	17 1/2-19 1/2	-39

The egg market is in better shape than it was a week ago, but even the best is pretty bad as far as producers are concerned. Nearby eggs have been selling only fairly well, a shade higher than they brought a week ago. Premium Jerseys and other fancy nearbys are difficult to place on the open market above the outside prevailing rates due to the cheap eggs coming from the West. Some cars of mixed western coloreds are going into storage for a long hold. It is believed that this is the earliest that mixed colored fresh eggs have been accumulated in storage. The new crop is going in before the old crop has been cleared.

Production has continued very heavy, principally under the influence of mild weather.

Retail prices have been quite moderate of late and a vast quantity of eggs is going into the distributing channels. From February 13 to 20 in the ten cities making daily reports 83,000, cases of eggs went into distributing channels compared with 37,000 during the same period last year. On February 20 the ten cities held 239,000 cases of eggs compared with holdings on the same day a year ago of 15,000 cases. That's bad.

NEW STYLE MOUTH PIECE

IT has always been easy to produce clean milk with the Burrell — and now, with the new style mouth piece, it is easier than ever. There's a satisfied user near you — ask him! The Burrell has only one tube, one-half metal. Single and double units. Write for catalog.

UNADILLA SILOS

ALFALFA, TIMOTHY AND STRAW
to carlots. THE CROSS FARM, Fayetteville, New York

Hen turkeys have been in demand and they may go higher. Fancy capons are also wanted. It may be that the market will change by the time the reader gets this report. Just as the market came to a close on Saturday noon, colored fowls seemed to be slowing up with Leghorns still in demand. Several poorly timed shipments of live broilers arrived very late. Those who get reports by radio are in the best position on Monday.

Hay Market Easier

An over-supply of low grade hay mostly from Canada flooded the market last week and over-burdened the trade. Until this is cleaned up local producers of low grade hay are going to take less money for their crops. High grade hay is still scarce. Straight timothy in large bales still brings \$29. Low grade hay in small bales is hard to place at any price. Some of it is little better than straw, which has very limited demand.

In the Produce Market

Maine potatoes have turned very weak. It has been practically impossible to get \$3 for 150 pound sacks and very few Long Islands do any better. The whole potato market appears to be having difficulty, including stock from Idaho, Canada and the South. Cabbage in bulk has slipped to \$16 to \$18 per ton and holding on for dear life.

The onion market is just a shade better than it was a week ago, although the difference is so slight that it appears to make no impression.

The apple market has been moving along quite well this week for both basket and barrel goods. Baldwins and Greenings have reached \$5.50 per barrel, McIntosh and Northern Spy \$6. Medium and ordinary grades lower down to \$2.25.

Live Fowls Bring More Money

Live fowls are several cents better than they were a week ago. In fact, all lines of live poultry have been selling this week. In some lines small sales have even exceeded quotations. Fancy chickens and pullets have been very scarce and wanted. Colored pullets bring from 26c to 30c and Leghorns bring from 24c to 25c. Very few broilers have been received. Some Rocks were forced as high as 43c, but at that figure we have had a top-heavy situation.

Farm News from New York

Health Commission Appointed Last Spring Reports to Governor

IN May 1930, Governor Roosevelt appointed a State Health Commission, headed by Dr. Livingston Farrand, president of Cornell University, to study health conditions in New York State and report to him. Their findings, just presented to the Governor, point to some improvement but make some very definite suggestions for a ten-year program looking toward improvement of health conditions in the State.

In studying conditions for the past twenty years, the Commission reports

pollution by industrial wastes be given to the Department of Health.

That the present authority of the Public Health Council to establish qualifications for certain public health personnel be extended to include other positions in the public health field.

Muscle Shoals Deadlock Ended

NEWSPAPER headlines recently announced that the Muscle Shoals deadlock is ended. The report states that committees from the Senate and House have finally signed a compromise agreement providing for the operation of the government's \$150,000,000 power and nitrate plant. The agreement provides for government operation of the power plant, lease of the nitrate plant for the production of fertilizer, and government construction of power transmission lines for the distribution of electricity from Wilson Dam. The agreement was signed by: Senators McNary of Oregon and Norris of Nebraska, Republicans, and Smith of South Carolina, Democrat, and by Representatives Wurzbach of Texas, Republican, and Fisher of Tennessee and Quin of Mississippi, Democrats.

Assuming that the necessary legislation is passed, the President will have one year after the enactment of the bill in which to negotiate a lease for the nitrate plant. If he is unable to do this, the plans are that the government will operate the plant for the experimental production of fertilizer.

First Annual Sheep Day Dinner

ABOUT seventy-five men and women interested in the sheep industry of the State, representing the ownership of 11,500 head of sheep and lambs, sat down to the annual lamb dinner for sheepmen on Wednesday, February 11, 1931, at Prudence Risley Hall, Cornell University, Ithaca, New York. Optimism and good fellowship were the keynote of the gathering. Cornell is be-

coming more and more the headquarters for the sheepmen of the State.

Professors Willman and Grams with the whole-hearted support of Dr. Morrison, the head of the Department, are putting the sheep work at the College ahead. A new sheep barn is about to be built to furnish facilities for conducting the experimental work which the lamb feeders and breeders are demanding. The State has a half million sheep and stands 11th among the states as a feeder of western lambs. The farm flocks of the State are a substantial prop under the diversified scheme of farming so necessary at this time. Even at the low prices, market lambs last year proved as profitable as any phase of agriculture.

R. S. Mathewson, head of lamb buying force for Swift and Company, Chicago, the dean of all lamb buyers—having purchased in his lifetime 125,000,000 head of lambs—said last fall at the convention of the National Wool Growers Association at Colorado Springs—"We have a demand for choice lamb that we cannot satisfy," and, "I can say that we have never really had an over-supply of choice lambs."

The significant word is "choice" and New York State has the best market in the world for these lambs. We can compete with the West in maintaining ewes because we have the by-product factor on the farms. The British Isles, with an area four-fifths the size of California, on arable land maintain 30,000,000 sheep.—MARK J. SMITH.

Legge to Retire from Farm Board

CITY newspapers are giving considerable space to the rumor that Alexander Legge is to retire as chairman from the Federal Farm Board at an early date to resume his connection with the International Harvester Company; and that Samuel McKelvie, a Board member and former Governor of Nebraska, will also resign from the Farm Board, effective June 15.

James C. Stone of Kentucky, vice-chairman of the Board and the mem-

ber of the Board who gave a talk at the meeting of the National Grange at Rochester last fall, is most prominently mentioned as Mr. Legge's probable successor.

Dr. P. A. Fish

LAST week, just as we closed our forms, we were obliged to announce the death of Dr. V. A. Moore, for many years dean of the New York State College of Veterinary Medicine and a national leader in veterinary circles.

Today, almost exactly a week later, word comes from Ithaca of the death of Dr. P. A. Fish, on Thursday, February 19. Dr. Fish succeeded Dr. Moore, retired, as dean of the State Veterinary College about a year ago. The College, the State and thousands of friends who were privileged to know these men have met with an irreparable loss in their deaths.

The life histories of Dr. Moore and Dr. Fish had much in common, and should be an inspiration toward achievement for all young men. Both men were New York State boys, who worked themselves up to the top of their profession by sheer ability and hard work.

Dr. Fish graduated from Cornell in 1890. In 1894 he took his Doctor of Science degree and in 1899 he also graduated from the State Veterinary College as a Doctor of Veterinary Medicine. During the past quarter century, Dr. Fish has been a noted scientist and teacher of veterinary, animal husbandry and related subjects. He was editor of the *American Journal of Veterinary Medicine* at one time, was a major during the World War, and was the author of several books.

The staff of *American Agriculturist* join with their friends in deepest sympathy to the families of both of these great men.

An error has been called to our attention in the January 24 issue reporting the Sheffield price to producers. This should have been \$2.18 for 3 per cent milk in the 201-210 mile zone.

New York County Notes

make maple sugar and syrup will soon be washing buckets so as to be ready to tap at the first indication of a sap run—which may be any time from the last of February to the first of April. I remember a year when sap did not run at all until April, and there was a lot of syrup of fine quality made that month. On the other hand, it occasionally ends before March is over, though not often. Never two seasons are alike.

As usual, a large number from Western New York attended Farmers' Week at Ithaca.

Neither potatoes nor hay are moving much. Eggs are selling on the Buffalo market at 19 and 22 cents. Local buyers are offering 17 and 18 cents.

ORANGE COUNTY—The past week saw a snowfall of ten inches, but very little difficulty in travel was encountered. Many of the rural roads were cleared for travel during the night following the storm. Mr. C. C. Davis, county agent of the Farm Bureau, is back in his office after a week at the State College, with many new ideas gathered from the Farmers' Week programs.

Pomona Grange will be in session at Montgomery on March 4 at 10:30 A. M. The topic of discussion will be, "What Is Fair to Railroads Taxed for Roadbed As Against Auto Trucks and Buses Using a Free Highway." Members are urged to come prepared to take part in the discussion.

Eggs are on the upward trend to the present 30 cents a dozen and climbing slowly.—R.H.

SCHOHARIE COUNTY—We have been having much cold weather and snow of late. The "magic gavel" of the New York State Grange has completed the circuit of the active subordinate Granges in

Schoharie County. It was brought to Cobleskill State School Grange on January 6 by 51 Delaware County patrons.

Eggs are still selling for 20 cents per dozen; butter from 32 cents to 40 cents.—MRS. L. McM.

SULLIVAN COUNTY—Over 40 inches of snow have fallen so far, and the thermometer has registered below zero many mornings. The second baby chick show will be held at Liberty on March 12-13 under the auspices of the County Farm Bureau. The Farm Bureau is planning a bus to go and take members to Plainboro, New Jersey, on February 26 to see the Walker-Gordon plant.

Our county has raised \$1125 toward the drought relief sum.

The Farm Bureau has been holding meetings the past week and four more meetings will be held in March. All meetings are very interesting and much is learned.—MRS. P. E. R.

COLUMBIA COUNTY—It was 18 below zero one early morning last week. Ice harvesting is finished. Hand-sleds, sleighs, and auto ferry are used to cross the Hudson River from Hudson to Athens. Some persons skate across and others walk. A snowbank on a north side farmhouse roof was three feet deep last week. Several are ill with the old-fashioned grippe. Teachers in some places are among them.

Several flocks of sheep have been visited by strange dogs in various parts of the county, and many sheep destroyed. The dog law is being enforced now. A rabies quarantine is on in Chatham and Ghent townships. All dogs running at large have to be muzzled unless they are on their owner's property, or on the other person's property who is willing for them to be there. Icy roads prevail; gravel is put on icy hills in many towns to aid motorists. Butter is 35 cents a pound.—MRS. C. V. H.

Farm Radio Announcer Honored

THE thousands of farm folk who listen regularly to the pleasant voice of George E. Markham, announcer on the Farm Program of WGY, broadcasting station of the General Electric Company at Schenectady, will be interested and pleased to know that Mr. Markham has just received an award for outstanding service in the electrical industry.

Mr. Markham proposed and planned the first comprehensive agricultural program for WGY in 1925, a program which is generally recognized as one of the best and most helpful farm radio hours on the air. Mail received by the Radio Service Bureau of the United States Department of Agriculture for the first ten months of 1930 shows that of 163 stations using the farm broadcasting material supplied by the Bureau, WGY is heard by the largest number of listeners. Mr. Markham and WGY have cooperated for years with *American Agriculturist* to broadcast regularly twice a week editorials and the farm news.

Mr. Markham received the Charles A. Coffin Foundation Award for developing an outstanding agricultural radio program and for showing the advantages of farm electrification. We join with the thousands who daily hear his voice in offering our congratulations for this honor so richly deserved.

a 50 per cent reduction in deaths from tuberculosis, resulting in a saving of the lives of 12,000 persons in 1930 from this disease, and a similar decline in the death rate of infants. The total death rate in New York since 1913 has declined 14 per cent and as a result the expected span of human life in the State has increased from 47 years in 1900 to 57 years in 1930. Since 1913 there has been a decline in the death rate from communicable diseases from 419 per hundred thousand population to 196 per hundred thousand population.

The principal recommendation of interest to farm readers is that county boards of health be organized in all counties in place of existing town health boards and health boards in villages of less than 5,000 population.

Other recommendations are:

That in cities of more than 50,000 population and in the large counties health commissioners hereafter appointed be required to devote their entire time to the duties of their office.

That the state establish three additional state tuberculosis sanatoriums.

That a division of cancer control be established in the State Department of Health.

That adequate facilities be provided for the discovery and care of crippled children.

That additional authority over the sanitary control of public water supplies and over the problem of stream

GENESEE COUNTY—A fine rain Friday helped fill wells and cisterns. The ground is so dry that creeks do not rise to any great extent. A blizzard Saturday filled up the crossroads and the snow packed between the great high piles of snow in places so that they had to be shoveled out. Because of the crusty surface and packed snow, snowplows can hardly get through.

Dairy butter has dropped to 25 cents a pound. Eggs are 19 cents to 21 cents a dozen at local stores. Mixed hay brings a fairly good price, but there is not much demand for straw.

Work is picking up somewhat and farm labor can be had for a little more than board and bed.—MRS. R. E. G.

ONTARIO COUNTY—We are having very nice weather with an occasional thaw and freeze. Yesterday we had the most rain we have had for months. It will help to break the drought and make less work for farmers. Stock of all kinds is doing well, except hens, which are on a strike. I think it just as well as the price is far below the cost of feed and labor.

Well, the taxes have been paid once more. They keep mounting higher and higher each year. When will our legislators do as they should, and place them where they should be? In Hopewell Grange 472 at our last meeting a resolution was adopted commending the Governor for withholding an appropriation in the budget for the improvement of parks in the Finger Lake Region. I remember a wise man once making this remark: "Oh, consistency, thou art a jewel. If the city wants to expend money that way, spend their own money."—E. T. B.

WESTERN NEW YORK—February is low tide of the year. Farmers do chores and help keep the roads open. Those who

warm, for if they get chilled no care or feed will do much for them. Do not feed poults until 60 or 72 hours old. First give them some fine gravel and a drink of pure, clean water. In a few hours give some mash and chick grain. After two or three days, leave feed before them all the time. The most important things are cleanliness and pure air. Turkeys need a lot of air and it must be pure. Watch your ventilator. We use papers on brooder house floor and feed on clean papers. They must have quantities of green stuff, cut it up with the shears and don't stop when they are on free range. At least one-half of their feed should be green stuff. We like to keep poults off the ground until two or three weeks old. We like the porches on our brooder houses, but with coops we use floors under the little yards and clean them every day. Wash your water dishes every day and oftener if they need it. Change the water often so it is clean. If raising with hens, watch for lice. Powder the hen at least once a week; keep the coop clean and you shouldn't have lice. Teach your turkeys to rest many times a day, for poults are easily tired out and many die from this cause.

—Mrs. C. J. Doxtater.

More Trees for New York State

(Continued from Page 3)

amendments next fall. With three amendments before us, each dealing with the Adirondack and Catskill Parks, misunderstandings are liable to arise which will cloud the issue and confuse the public mind. We probably need more discussion of these last two proposals before we say definitely that they should be approved.

The other question which I wish to discuss is a proposed law—a bill now before the Legislature to extend the so-called blue line defining the Adirondack Park. The blue line is one of those imaginary boundary lines that we used to read about in geography, that defines the limits of the Adirondack Park. The Park now embraces about 3 million acres. The new bill proposes to extend this line in all directions and to take in about one and one-half million additional acres. Almost none of this additional area falls in the abandoned farm class. It is nearly all densely wooded land that ought to be in the Park.

A Fringe of Abandoned Land

There is also, but still further outside of the mountain and park area, in other words outside the proposed extension of the blue line, a fringe of abandoned farm land that should be reforested. This area is estimated at one million acres.

If the Hewitt amendment passes, it will be possible to reforest this abandoned farm area with production forests in the same way that many other abandoned farm areas all over the state may be reforested. If the proposed law to extend the blue line passes, the Adirondack Park will be enlarged to include much forest land which should be park land and at the same time all production forest areas to be developed under the Hewitt amendment will be kept well away from the park area proper.

These two pieces of legislation are interlocking and interrelated. Both should be passed at the same time; that is, the extension of the blue line should be done by legislative enactment this winter and the amendment to the Constitution providing for a permanent reforestation program should be approved by the people next November.

There has been some misunderstanding of these two bills, some of it wilful and some of it sincere. There will (Continued on Opposite Page)

BABY CHICKS

(Continued from Opposite Page)
be some opposition to them, some of it sincere and disinterested and some of it perhaps not so sincere. After the most careful sort of a study by myself and by my Conservation Commissioner, Henry Morgenthau, Jr., I want to state that in my judgment the interests of the State are best served and are entirely protected by these two pieces of proposed legislation—the extension of the blue line and the Constitutional amendment providing for a permanent long term program for reforestation in the State of New York.

Eleven Master Farmers Honored

(Continued from Page 5)
the Governor, "that confronts every state, and, in fact, every industrial nation, and that is, how far can this urge from country to city continue before we reach the saturation point? This cannot be far distant because it is impossible for anyone to conceive of a world where all inhabitants are city dwellers."

Continuing, the Governor declared that the Master Farmer movement will do much to bring about a clear thought and conception on the problems lying ahead. Particularly is this true of the 4-A awards to young folks, "because," he said, "if we can only make our young folks wonder enough they will find the answers to the problems." The Master Farmer movement is also disproving the old slurs about unsuccessful farmers. "The farmers" said the Governor, referring to the Master Farmers of this year and of former years, "are the facts which disprove the idea. The men and women who have been honored this year and in previous years have been recognized for success in the broader sense of the word, as farmers and citizens."

Outstanding Young Folks

Following his brief talk, the Governor first presented the 4-A awards to six young folks. This is a new departure this year. Following somewhat the same method used to select Master Farmers, two vocational students in agriculture, two members of 4-H Clubs, and two Boy Scouts living on farms were selected for outstanding achievement in their work, and presented by the Governor with gold medals to be known as the 4-A awards.

This award is not altogether a personal award and does not necessarily indicate that the young folks are the best or that they have achieved most among the members of their various groups. It is designed to call attention to the wonderful training which these three organizations are giving to our boys and girls.

No one needs to worry about the future of agriculture in New York State if a sufficient number of young

folks can receive the same training and leadership in agriculture.

This year medals were given to eleven Master Farmers. One by one they and their wives were called to the speakers' table, while the Governor gave a brief account of some of the things they had done on their farms, in their homes, and in their communities. Each Master Farmer then gave a very brief response. The impressive thing about these responses was the impression that they left with the guests that the designation was considered more in the light of a responsibility than as an honor.

For example, George LaMont of Orleans County expressed the desire so to live and conduct his farm business that young folks might look up to agriculture as a dignified and satisfying business and method of living.

Fred Hollowell of Yates County, whose farm has been in the family for several generations, said that he did not feel that he was entitled to credit for what he had done, having as he does, a fine farm, an exceptional community, a wife who was always willing to help, and a fine family. "With them," said Mr. Hollowell, "anyone could have done as much as I have done, if not more."

Charles Riley of Cayuga County, one of the younger Master Farmers, said: "We accept this award as a responsibility and trust that we may never do anything that will cast reflections on those who have chosen us for this recognition."

These responses are chosen at random from among those of all the Master Farmers to illustrate the spirit with which they, without exception, accepted the title.

Old Time Music

Both during the banquet and during the program community singing was led by R. W. Pease of Ontario County, who is familiarly known to thousands of farmers as "Daddy" Pease. John McDermott, who also has countless friends in New York State and who is known far and wide as the New York State champion old-time fiddler, gave three of his most popular selections, among them being, "Oh, Those Golden Slippers." An impromptu feature was staged when "Scotty," otherwise known as K. D. Scott of Chenango County, was spied and a special request forwarded to the toastmaster that he be made to sing. Scotty stood up and addressed the toastmaster saying, "Mr. Commissioner, if you were in a hole like this, what would you do?" Commissioner Morgenthau replied, "I'd sing," and Scotty did. He sang "Annie Laurie" and "Roamin' in the Gloamin'". By special request, Daddy Pease led the guests in singing, "Li'l Liza Jane," with the usual stretching exercises. Needless to say, all the music was enthusiastically received.

Henry Morgenthau, Jr., in introducing the Governor, spoke of the last two years as the "Roosevelt era" in New York State agriculture and reviewed briefly some of the accomplishments that have been made through the co-operation of the Legislature, New York State farm organizations, the Governor's Agricultural Advisory Commission, and the Governor himself.

Sweet clover will sometimes send its roots to a depth of four feet within a year of being planted.

THE WHY OF KERR CHICK SUPERIORITY

LAYING inheritance, lusty vigor—these are the outstanding qualities of Kerr's baby chicks.

A rich inheritance from heavy-laying ancestry—a lusty vigor based upon a strong constitution transmitted from heavy producing stock. Baby chicks must have these qualities to make profitable layers.

The inherited prepotency for high egg yields of Kerr chicks has been proved beyond question in the great egg competitions and is now a fixed quality. Unusual care is exercised to guard against parasitic infection and diseases. Kerr chicks are available from B. W. D. tested stock. Send for the new Kerr illustrated Chick Book and prices. Sent free upon request.

Women at Farm and Home Week

Good Attendance Testified to the Pulling Power of an Interesting Program

THE women's program at Farm and Home Week at Cornell has come to be an affair of such varied interest and of such widespread scope that it is impossible to cover it all in the pages of one paper. The very best way to know what is going on during Farm and Home Week is to go once and see for yourself. After that, you will never want to miss it.

Practically every phase of home-making was touched upon in one form or the other during the week. Some of the topics touched either by lecture or by demonstration or exhibit, were: How to buy and how to make cloth-

people which they had never before held.

Other distinguished speakers at the two o'clock daily sessions in Bailey Hall, were:

The Governor of New York State, the Honorable Franklin D. Roosevelt; George E. Russell (AE) Irish statesman and poet; M. C. Burritt, Public Service Commissioner; Dr. A. R. Mann, Dean of the State College of Agriculture.

A feature which was of state-wide interest because it attracted the individual performers from all districts, was the Dramatics Contest held at Willard Straight University Theatre. The preliminaries to this contest had been run off, first in each county, then in each of the five districts of the State, and this was the final State contest between the five districts. These districts and the plays which they presented, were as follows:

Voak Home Bureau, Yates County, "The Rag Carpet Bee"; Byron Home Bureau, Genesee County, "The Crowned Glory"; Malone Home Bureau, Franklin County, "Joint Owners in Spain"; Hamilton Home Bureau, Madison County, "Our Aunt from California"; The Community Players of Red Hook Grange, No. 918, Dutchess County, "Cabbages."

First prize of \$50.00, which is being given by the State Federation of Home Bureaus, was won by the Malone Home Bureau of Franklin County. Honorable mention was made of the plays presented by the Hamilton Home Bureau of Madison County, and by the Community Players of Red Hook Grange. Each group will receive twenty dollars for the community enterprise which they select to be benefited.

Tested Recipes

Maple Dessert

Into the well beaten product of four eggs, stir one cup of hot maple syrup. Put in double boiler, and cook until thick, stirring continually. Then cool cold, and stir into one pint of cream whipped very stiff. Pack in the freezer, using ice and salt for packing and let stand four hours before serving.—C. R.

This very rich, fine dessert could easily be packed into small cups like tortoni, which would make a very attractive serving on a plate with a lace or lace paper doilie as the decoration.

Maple Fudge

To 3 cups of maple sugar, add 1 cup of sweet cream and boil until it forms a soft ball. Beat until light, and add 1 cup of broken butternut

meats, or chopped raisins. In fact, any broken nuts are good, though butternuts are preferable.—C. R.

Filipino Beef

1 lb. of beef, chopped	1 lb. of fresh pork, chopped
1 small onion, minced	1 cup bread crumbs
1 green pepper, shredded	1 egg
2 cups stewed or canned tomatoes	Salt and pepper to taste
2 slices bacon	2 tablespoonfuls of butter
	4 tablespoonfuls of flour

Fry onion and pepper (from which the seeds have been removed) in a little fat. Add to chopped meat. Now add bread crumbs, egg, salt, and pepper. Form into a flat loaf in a shallow baking dish. Pour tomatoes over it. Lay bacon on top of loaf, and bake forty minutes basting occasionally with the tomatoes. When done thicken the gravy with the flour cooked in the butter. A bay leaf or small piece of onion added to the gravy gives a pleasing flavor. Serve with boiled rice or potatoes.

Mock Rabbit

1 lb. beef, chopped	3 slices salt pork
1 egg	1 cup pork sausage
3 slices bread moistened with water	1 onion, minced
	Salt and pepper to taste

Dice one slice of the salt pork and heat onion in it. Add this to the chopped meat. Now add bread, egg, salt, and pepper. Form into a long oval loaf in baking dish. Place remaining two slices of salt pork on top of loaf, and bake in a hot oven forty minutes.

Stuffed Green Peppers

6 peppers	1 minced onion fried in 1
1 cup chopped meat	tablespoon fat
1 egg	Salt and pepper to taste
1 cup bread crumbs	Meat broth, gravy, or hot water

Cut a thin slice from top of pepper. Scoop out seeds and pulp. Then cover pepper with boiling water and let stand ten minutes. Mix bread crumbs, onion, egg, salt, and pepper. Add enough meat broth, gravy, or hot water to moisten. When peppers are removed from water, stuff with this mixture. Sprinkle bread crumbs and bits of butter over top, add a little meat broth or hot water, and bake in a moderate oven till tender.

Stuffed Tomatoes

6 tomatoes	1 tablespoonful of butter
1/2 cup bread crumbs	1 egg, slightly beaten
1 cup chopped meat	Salt and pepper to taste

Remove a thin slice from stem end of tomatoes and scoop out seeds and pulp. To beaten egg add meat, melted butter, salt, and pepper. Mix thoroughly and fill into tomatoes. Sprinkle top with bread crumbs and bits of butter. Bake in a hot oven until tomatoes are tender.—MRS. R. C. K., Ariz.

All these recipes have been tested in our testing kitchen and found entirely suitable for use by our readers. If you

are using our recipes and following the suggestions given with them, it would encourage us greatly to have a line from you to that effect.

Patchless Patchwork Designs

Now you can make the most gorgeous looking patchwork quilts without spending the many hours patching little pieces together. These blocks are 18 inches square, of extra fine grade white sheeting and the parts these illustrations show black are tinted with beautiful absolutely washfast pastel shades. For a quilt size 72 x 90 twenty of these blocks are required. Join blocks together matching the designs. Then stitch around tinted portions with the quilting stitch and also fill in the white spaces with a quilting design. If this size of quilt is not sufficiently large simply attach a nine

to twelve inch border of color that will match the tinted block. Plain contrasting blocks are not used for these quilts. The color tinting is as follows: No. C1121 is in green; No. C1122 is in blue; No. C1123 is in orchid and No. C1124 is in rose. For a quilt, price for 20 of these tinted blocks, including a stamped pattern for filling in the white spaces with quilting stitch, is \$3.85. Price for single tinted block, is 20c and price for stamped quilting design is 15c each. Order from Embroidery Dept., American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

Flowers Satisfy the Soul

(Continued from Page 2)

lifted before the ground freezes and kept in a dry, cool place over the winter. A border featuring tulips, iris and gladioli will provide a charming succession of bloom.

There are all sorts of flowers for special purposes, for the lily pool, for the rose garden, for house-culture or for the greenhouse. But the home flower-lover can take great satisfaction in growing the old favorites, and then, when she has gained experience and confidence, she can venture into the special varieties.

The state college of agriculture in your own state would have bulletins on flower growing, free to residents of the same state. New York state college of agriculture is in Ithaca, N. Y.; New Jersey state college is at New Brunswick, N. J.; Connecticut state college is at Storrs, Conn.; Vermont state college is at Burlington, Vt.; Pennsylvania state college is at State College, Pa. Many of the colleges have bulletins on special flowers, and in addition, they usually have one on the flower garden as a whole.

Also the seed companies would be glad to answer specific questions about growing flowers. Furthermore, the Household Department of A. A. will be glad to help you get bulletins and information. The Household Editor can be reached at 461 Fourth Avenue, New York City.

The flower illustrations used on the cover page were provided through the courtesy of Howard M. Gillet, New Lebanon, N. Y.

Three Pet Pillows

These pet pillows—Polly, Pussy and the Pup—would almost brighten a lonely corner in the dormitory on no-date night. They are cunning little companions of black, white and red felt on blue satine box pillows, all put together with a piping strip of red felt. Complete materials for making are in each order and they are made with a minimum of effort.

Number M626A is the Polly. Number M626B the Cat, and M626C the Pup. The group of three pillows is number M626D. A 10-inch box pillow filled with Kapok to fit the pillows is

M573A. These are so easily made, being first pasted into place with a bit of glue then stitched. Of course definite instructions accompany each order.

ing, the new spring styles, taking care of household furnishings and clothing, lighting the home, arranging and using flowers in the home, feeding and caring for children, how to serve meals attractively, choosing a diet for oneself and the family, how to manage the family pocketbook, home gardens and home grounds—how to make them beautiful.

Well-known speakers who appeared on the platform to instruct and entertain the visitors, were:

Lucile Brewer of the New York State College of Home Economics; Dr. Amy L. Daniels of the University of Iowa; Miss Flora Rose, Director of the State College of Home Economics; R. M. (Bob) Adams, of the State College of Agriculture; Chesla Sherlock, Garden Editor of the Ladies' Home Journal; Mrs. Eliza Keats Young, past President of the New York State Federation of Home Bureaus; Mrs. Lillian Gilbreth, Efficiency Engineer; Miss Martha Van Rensselaer, Director of the State College of Home Economics; Miss Marion Van Liew of the State College for teachers.

On Thursday, the day set apart for the women's program, Bailey Hall was crowded to overflowing with people anxious to hear Mrs. Ruth Bryan Owen, Congresswoman from Florida, and daughter of William Jennings Bryan. Mrs. Owen's topic was "Our Place in the Changing World." Taking part in the government for which our forefathers sacrificed so much is, to Mrs. Owen's mind, one of the important things which young people can be taught to appreciate. She told how she, herself, had helped to accomplish this with a group of 36 boys and girls from her own district, who had been chosen as the best young citizens by their own home towns. She took them to Washington where the doors of departments were opened freely to them as "best young citizens." After introducing them to the various departments of the government and letting them see how it actually operates, after having an impressive ceremony beside Washington's monument, after visiting other historical spots around Washington and realizing that the people who lived there were real people and not mere myths, these young people had an idea of our government as a right of its

Aunt Janet's Corner

Homes Are Wanted for These Children

VERY often, we get requests from readers who are looking for children to board or adopt. Now, we have a request which comes from another direction—from the Children's Aid Society, which is looking for good homes for some children now in their care. The following request gives the information: The Children's Aid Society have several fine little boys between the ages of 7 and 12 years whom they wish to place in homes in New York State for adoption. The children are well trained, nice mannered and are placed on trial. There are also several girls between the ages of twelve and fourteen needing high school education. Apply to MISS C. B. COMSTOCK, Dist. Supt., The Children's Aid Society, 21 Collier Street, Hornell, N. Y.

Use Right Soil in Seed Boxes

"ALL kinds of trouble have been caused in inside window boxes by failure to provide the proper soil," says A. L. Ford, extension horticulturist. "Many of the common soils form hard crusts and crack after they are watered. This is caused by a lack of organic matter."

Mr. Ford has had very good results with a soil composed of three parts

of good black garden loam, one part of sand, and one part of well-rotted barnyard manure, thoroughly mixed together. The top inch should be screened before the seed is put in. After being watered, the soil will show a tendency to draw away from the sides of the box. In order to prevent this it is a good idea to go around the edge pressing the soil with the finger tips before planting or watering.

Another handy wrinkle in using inside window boxes is to cover the soil with a wet newspaper immediately after planting the seed. After four or

Conservative Type

2951

TAILORED DRESS PATTERN No. 2951 is best described as "snappy." Made up in plain light navy blue flat crepe, offset by a white crepe neckline band, this dress is simple and most becoming besides fitting admirably into almost any daytime occasion. The skirt is slightly circular with inverted plaits at each side of the front. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3½ yards of 39-inch material with ⅜ yard of 35-inch contrasting. PRICE 15c.

five days, as the plants start to come through the surface of the soil, the newspaper should be removed. This gives more uniform and quicker germination, preventing evaporation and keeping the soil from cracking and crusting.

Do You Know That—

Pies should be baked at once after they are prepared, to keep the crust light. If they must wait, keep them in the refrigerator where the pastry will be cold.

A well-stocked emergency shelf provides for unexpected guests.

Baked apples make a pleasant variety for the school lunch. They may be safely packed in a paraffin cup with a tight-fitting cover.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR

That's why

THE BIG GOLDEN BAR IS CHOCK-FULL OF EXTRA HELP

If you're a thrifty housewife, you'll like Fels-Naptha first of all because it's a big, generous bar.

But there's more to Fels-Naptha than that! The instant you unwrap Fels-Naptha, your nose will prove it! For you'll smell naptha right in the smooth, rich soap. Plenty of naptha, the dirt-loosener. Proof that you're getting a real bargain in washing value.

For every time you use Fels-Naptha you get the extra help of two busy cleaners. Not "just soap," but good soap and plentiful naptha. Working together, this lively pair loosens stubborn dirt and washes it away. There's no hard rubbing for you. Yet the clothes come out of the wash sweetly fresh and clean clear through—whether you soak or boil; whether you use tub or machine; hot, lukewarm or cool water.

Fels-Naptha treats your hands gently, too. It works quickly and gets them out of water sooner. And Fels-Naptha contains bland, soothing glycerine. Ask your grocer for Fels-Naptha. Get a supply of this extra help today!

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Dept. 1-2-28, Fels & Company, Philadelphia, Pa.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR

FELS-NAPTHA

Mothers, Mix This at Home for a Bad Cough

You'll be pleasantly surprised when you make up this simple home mixture and try it for a distressing cough or chest cold. It takes but a moment to mix and costs little, but it can be depended upon to give quick and lasting relief.

Get 2½ ounces of Pinex from any druggist. Pour this into a pint bottle; then fill it with plain granulated sugar syrup or strained honey. The full pint thus made costs no more than a small bottle of ready-made medicine, yet it is much more effective. It is pure, keeps perfectly and children love its pleasant taste.

This simple remedy has a remarkable three-fold action. It goes right to the seat of the trouble, loosens the germ-laden phlegm, and soothes away the inflammation. Part of the medicine is absorbed into the blood, where it acts directly upon the bronchial tubes and thus helps inwardly to throw off the whole trouble with surprising ease.

Pinex is a highly concentrated compound of genuine Norway Pine, containing the active agent of creosote, in a refined, palatable form, and known as one of the greatest healing agents for severe coughs, chest colds and bronchial troubles.

Do not accept a substitute for Pinex. It is guaranteed to give prompt relief or money refunded.

Soft and Graceful

2984

DRESS PATTERN No. 2984 is charming in its rippling softness and yet is smartly simple. A purple-blue flat crepe with a sparkling enamel buckle in matching shade is one of the accepted color schemes just now. The cowl drape of the bodice is very flattering, while the curved seaming of the skirt is slimming in effect. Pattern may be had in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3½ yards of 39-inch material. PRICE 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps. (Don't send coin). Add 12c for one of the new Spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is lonely but several new friends make life more pleasant for him. There is blind Joe Glaspell who plays the violin, Jack and his sister, Jill, who rescue him when he gets into a fight over a kitten, and his "Lady of the Roses" who lives in the beautiful house on the hill.

Mr. and Mrs. Holly seem to be in serious trouble. As near as David can guess, it concerns money. Having no use for the gold pieces his father left him and wishing to help, he astonishes the Hollies by bringing his cap full of gold pieces.

David cannot understand why his Lady of the Roses and Jack are not on good terms. His Lady tells him that none of her hours are happy ones, and when David tells this to Mr. Jack it seems to start him thinking.

* * *

Mr. Jack started.

"Er—nothing; nothing that you would understand, David. Go on—with what you were saying."

"There isn't any more. It's all done. It's only that I'm wondering how I'm going to learn here that it's a beautiful world, so that I can—tell father."

Mr. Jack roused himself. He had the air of a man who determinedly throws to one side a heavy burden.

"Well, David," he smiled, "as I said before, you are still out on that sea where there are so many little up-turned boats. There might be a good many ways of answering that question."

"Mr. Holly says," mused the boy, aloud, a little gloomily, "that it doesn't make any difference whether we find things beautiful or not; that we're here to do something serious in the world."

"That is about what I should have expected of Mr. Holly," retorted Mr. Jack grimly. "He acts it—and looks it. But—I don't believe you are going to tell your father just that."

"No, sir, I don't believe I am," accented David soberly.

"I have an idea that you're going to find that answer just where your father said you would—in your violin. See if you don't. Things that aren't beautiful you'll make beautiful—because we find what we are looking for, and you're looking for beautiful things. After all, boy, if we march straight ahead, chin up, and sing our own little song with all our might and main, we shan't come so far amiss from the goal, I'm thinking. There! that's preaching, and I didn't mean to preach; but—well, to tell the truth, that was meant for myself, for—I'm hunting for the beautiful world, too."

"Yes, sir, I know," returned David fervently. And again Mr. Jack, looking into the sympathetic, glowing dark eyes, wondered if, after all, David really could—know.

Even yet Mr. Jack was not used to David; there were "so many of him," he told himself. There were the boy, the artist, and a third personality so evanescent that it defied being named. The boy was jolly, impetuous, confidential, and delightful—plainly reveling in all manner of fun and frolic. The artist was nothing but a bunch of nervous alertness, ready to find melody and rhythm in every passing thought or flying cloud. The third—that baffling third that defied the naming—was a dreamy, visionary, untouchable creature who floated so far above one's head that one's hand could never pull him down to get a good square chance to see what he did look like. All this

thought Mr. Jack as he gazed into David's luminous eyes.

* * *

CHAPTER XX

THE UNFAMILIAR WAY

IN September David entered the village school. School and David did not assimilate at once. Very confidently the teacher set to work to grade her new pupil; but she was not so confident when she found that while in Latin he was perilously near herself (and in French—which she was not required to teach—disastrously beyond her!), in United States history he knew only the barest outlines of certain portions, and could not name a single battle in any of its wars. In most studies he was far beyond boys of his own age, yet at every turn she encountered these puzzling spots of discrepancy, which rendered grading in the ordinary way out of the question.

David's methods of recitation, too, were peculiar, and somewhat disconcerting. He also did not hesitate to speak aloud when he chose, nor to rise from his seat and move to any part of the room as the whim seized him. In time, of course, all this was changed; but it was several days before the boy learned so to conduct himself that he did not shatter to atoms the peace and propriety of the schoolroom.

Outside of school David had little work to do now, though there were still left a few light tasks about the house. Home life at the Holly farmhouse was the same for David, yet with a difference—the difference that comes from being really wanted instead of being merely dutifully kept. There were other differences, too, subtle differences that did not show, perhaps, but that still were there.

Mr. and Mrs. Holly, more than ever now were learning to look at the world through David's eyes. One day—one wonderful day—they even went to walk in the woods with the boy; and whenever before had Simeon Holly left his work for so frivolous a thing as a walk in the woods!

It was not accomplished, however, without a struggle, as David could have told. The day was a Saturday, clear, crisp, and beautiful, with a promise of October in the air; and David fairly tingled to be free and away. Mrs. Holly was baking—and the birds sang unheard outside her pantry window. Mr. Holly was digging potatoes—and the clouds sailed unnoticed above his head.

All the morning David urged and begged. If for once, just this once, they would leave everything and come, they would not regret it, he was sure. But they shook their heads and said, "No, no, impossible!" In the afternoon the pies were done and the potatoes dug, and David urged and pleaded again. If once, only this once, they would go to walk with him in the woods, he would be so happy, so very happy! And to please the boy—they went.

It was a curious walk. Ellen Holly trod softly, with timid feet. She threw hurried, frightened glances from side to side. It was plain that Ellen Holly did not know how to play. Simeon Holly stalked at her elbow, stern, silent, and preoccupied. It was plain that Simeon Holly not only did not know how to play, but did not even care to find out.

The boy tripped ahead and talked. He had the air of a monarch displaying his kingdom. On one side was a bit of moss worthy of the closest attention; on another, a vine that carried allurements in every tendril. Here was a flower that was like a story for interest, and there was a bush that bore a secret worth the telling. Even Simeon Holly glowed into a semblance of life when David had unerringly picked out and called by name the spruce, and fir, and pine, and larch, and then, in answer to Mrs. Holly's murmured: "But, David, where's the difference? They look so

much alike!" he had said:—

"Oh, but they aren't, you know. Just see how much more pointed at the top that fir is than that spruce back there; and the branches grow straight out, too, like arms, and they're all smooth and tapering at the ends like a pussy-cat's tail. But the spruce back there—its branches turned down and out—didn't you notice?—and they're all bushy at the ends like a squirrel's tail. Oh, they're lots different! That's a larch 'way ahead—that one with the branches all scraggly and close down to the ground. I could start to climb that easy; but I couldn't that pine over there. See, it's 'way up, up, before there's a place for your foot! But I love pines. Up there on the mountains where I lived, the pines were so tall that it seemed as if God used them sometimes to hold up the sky."

And Simeon Holly heard, and said nothing; and that he did say nothing—especially nothing in answer to David's confident assertions concerning celestial and terrestrial architecture—only goes to show how well, indeed, the man was learning to look at the world through David's eyes.

Nor were these all of David's friends to whom Mr. and Mrs. Holly were introduced on that memorable walk. There were the birds, and the squirrels, and, in fact, everything that had life. And each one he greeted joyously by name, as he would greet a friend whose home and habits he knew. Here was a wonderful woodpecker, there was a beautiful bluejay. Ahead, that brilliant bit of color that flashed across their path was a tanager. Once, far up in the sky, as they crossed an open space, David spied a long black streak moving southward.

"Oh, see!" he exclaimed. "The crows! See them?—'way up there? Wouldn't it be fun if we could do that, and fly hundreds and hundreds of miles, maybe a thousand?"

"Oh, David," remonstrated Mrs. Holly, unbelievably.

"But they do! These look as if they'd started on their winter journey South, too; but if they have, they're early. Most of them don't go till October. They come back in March, you know. Though I've had them, on the mountain, that stayed all the year with me."

"My! but I love to watch them go," murmured David, his eyes following the rapidly disappearing black line. "Lots of birds you can't see, you know, when they start for the South. They fly at night—the woodpeckers and orioles and cuckoos, and lots of others. They're afraid, I guess, don't you? But I've seen them. I've watched them. They tell each other when they're going to start."

"Oh, David," remonstrated Mrs. Holly, again, her eyes reproving, but plainly enthralled.

"But they do tell each other," claimed the boy, with sparkling eyes. "They must! For, all of a sudden, some night, you'll hear the signal, and then they'll begin to gather from all directions. I've seen them. Then, suddenly, they're all up and off to the South—not in one big flock, but broken up into little flocks, following one after another, with such a beautiful whirl of wings. Oof—oof—oof!—and they're gone! And I don't see them again till next year. But you've seen the swallows, haven't you? They go in the daytime, and they're the easiest to tell of any of them. They fly so swift and straight. Haven't you seen the swallows go?"

"Why, I—I don't know, David," murmured Mrs. Holly, with a helpless glance at her husband stalking on ahead. "I—I didn't know there were such things to—to know."

There was more, much more, that David said before the walk came to an end. And though, when it did end, neither Simeon Holly nor his wife said a word of its having been a pleasure

or a profit, there was yet on their faces something of the peace and rest and quietness that belonged to the woods they had left.

It was a beautiful month—that September, and David made the most of it. Out of school meant out of doors for him. He saw Mr. Jack and Jill often. He spent much time, too, with the Lady of the Roses. She was still the Lady of the Roses to David, though in the garden now were the purple and scarlet and yellow of the asters, salvia, and golden glow, instead of the blush and perfume of the roses.

David was very much at home at Sunnycrest. He was welcome, he knew, to go where he pleased. Even the servants were kind to him, as well as was the elderly cousin whom he seldom saw but who, he knew, lived there as company for his Lady of the Roses.

Perhaps best, next to the garden, David loved the tower room; possibly because Miss Holbrook herself so often suggested that they go there. And it was there that they were when he said, dreamily, one day:—

"I like this place—up here so high, only sometimes it does make me think of that Princess, because it was in a tower like this that she was, you know."

"Fairy stories, David?" asked Miss Holbrook lightly.

"No, not exactly, though there was a Princess in it. Mr. Jack told it." David's eyes were still out of the window.

"Oh, Mr. Jack! And does Mr. Jack often tell you stories?"

"No. He never told only this one—and maybe that's why I remember it so."

"Well, and what did the Princess do?" Miss Holbrook's voice was still light, still carelessly preoccupied. Her attention, plainly, was given to the sewing in her hand.

"She didn't do, and that's what was the trouble," sighed David. "She didn't wave, you know."

The needle in Miss Holbrook's fingers stopped short in mid-air, the thread half-drawn.

"Didn't—wave!" she stammered. "What do you—mean?"

"Nothing," laughed the boy, turning away from the window. "I forgot that you didn't know the story."

"But maybe I do—that is—what was the story?" asked Miss Holbrook, wetting her lips as if they had grown suddenly very dry.

"Oh, do you? I wonder now! It wasn't 'The Prince and the Pauper,' but the Princess and the Pauper," cited David; "and they used to wave signals, and answer with flags. Do you know the story?"

There was no answer. Miss Holbrook was putting away her work, hurriedly, and with hands that shook. David noticed that she even pricked herself in her anxiety to get the needle tucked away. Then she drew him to a low stool at her side.

"David, I want you to tell me that story, please," she said, "just as Mr. Jack told it to you. Now, be careful and put it all in, because I—I want to hear it," she finished, with an odd little laugh that seemed to bring two bright red spots to her cheeks.

Oh, do you want to hear it? Then I will tell it," cried David joyfully. To David, almost as delightful as to hear a story was to tell one himself. "You see, first—" And he plunged headlong into the introduction.

David knew it well—that story; and there was, perhaps, little that he forgot. It might not have been always told in Mr. Jack's language; but his meaning was there, and very intently Miss Holbrook listened while David told of the boy and the girl, the wave, and the flags that were blue, black, and red. She laughed once,—that was at the bit—

(Continued on Page 18)

No Purses from Sows' Ears

(Continued on Page 3)

by the State and Federal Departments of Agriculture. It is paid for voluntarily by the shippers and has nothing to do with any law enforcement or similar regulatory activity. It makes it possible to "sell on certificate" or, in other words, to sell on a grade basis officially determined and set forth in a certificate which is an important aid in making sales. The same service is available in New York State but, so far, has been used by a very small percentage of shippers.

The well-graded appearance of Maine potatoes is really a by-product of other things. The sound approach to the grading problem in New York is fundamentally the same as it is in Maine, so far as achieving success in the carlot market is concerned.

New York's Advantage

With the nearby markets, reached by motor truck, it is a different matter. Here the miscellaneous character of the supply is not so important and lack of concentration of the volume is at least not fatal.

As a result, the average up-state New York potato producer, though he may not appear to be meeting modern market needs, is nevertheless able to find an outlet at a profit, even for poor potatoes, in a fashion quite impossible to his distant competitors.

Perhaps some marginal New York farmers should be denied this outlet by law, for the good of the potato industry as a whole. But, to many a farmer, operating under handicaps of insect pests and fungus disease, such a denial would be nothing short of tragedy. To many a city consumer of a certain class, also, such a removal of the opportunity to get cheap food, even though it fails to meet any recognized grade, would be a serious matter.

This last is not intended as any defense of careless production and marketing methods or of putting off-grade potatoes on the market. It is merely intended to point out something which we must not forget when we consider suddenly changing our present system of potato marketing by a law intended to compel grading and branding.

It is an old saying that you "can't make a silk purse out of a sow's ear." Neither can you make a really salable product out of poor stuff by any amount of sorting and grading at the time you are ready to sell it.

The grading problem for potatoes, as with most other farm products, is at bottom a production and harvesting problem—and this is the place to start in any program for better grading.

Proper Use of Grades

There is another aspect of the matter which has never yet received the attention it should have. Sorting to meet a certain standard is one thing. Selling on a grade basis is quite another thing. The real reason for establishing standard and recognized grades is to provide a "measuring stick" to use in describing the product in making a sale.

After a man has sorted his product to the extent that he deems worth while, or to the extent that his knowledge and expertness will permit, it is then time to apply the "measuring stick." Doing this last is really an expert's job, for it requires a detailed knowledge of grade requirements which the average person never has time to acquire. With the measuring stick thus applied, it may be found that the product examined is decidedly above the minimum requirements, when such a law is passed, is found that it meets the requirements of some grade except for a small excess percent of some one defect.

Whatever the result, the particular lot examined has been classified in relation to the recognized grades and can be described and sold honestly on this basis.

This is the way many Maine potatoes are sold, and this is the way any potatoes can be sold where Fed-

eral-State shipping-point inspection is available, because this service makes possible the use of trained experts to apply the "measuring stick."

Proposed Grading Law

The foregoing will bring out what, to me, seem to be two fundamental fallacies in every attempt to solve the grading problem by the passage of compulsory grading or branding laws.

In the first place the assumption that every good citizen automatically becomes possessed of a knowledge of how to meet technical grade requirements, when such a law is passed, is an entirely wrong one. Only a prodigious and costly amount of educational work would ever bring all potato growers and shippers up to such a standard.

Secondly, whenever a compulsory grading law is passed, if it contains a provision requiring the grade to be branded or marked on the container, there arises a rigidity in the use of the grade names which actually hinders their proper functioning as a "measuring stick." The operation of our present compulsory grape grading law will serve as an example of what is meant by this "rigidity."

A shipment of grapes may be of extra fine quality, far above the minimum requirements for U. S. No. 1 Table Grapes Grade, but not quite U. S. Fancy. Another shipment may just barely meet the minimum requirements of the grade and actually be a rather poor lot of grapes compared with the other. Yet, under our present compulsory law, both these shipments must be marked "U. S. No. 1." This plainly is a serious handicap in getting the price which should be secured for the better grapes—which are almost, but not quite, "Fancy" grade.

Because it is a direct attack on the problem, passage of a compulsory grading law has certain admitted advantages. Yet the disadvantages just pointed out are very fundamental

ones. They are why the passage of such a law brings with it complications that more than offset all its apparent advantages.

A far better procedure is to set up standard grades for optional use as a "measuring stick"—and this is exactly what we already have in the U. S. Potato grades now in common use.

Enforcement

Much has been said about the difficulties of enforcing a compulsory grading law. These difficulties can hardly be exaggerated, especially in the case of potatoes, which are raised in practically every county in the state and have a long shipping season. It would take a veritable army of inspectors to cover such a territory, the problem of training them would be no small task, and the cost to the state would be something unthinkable if complete coverage and enforcement were attempted.

A law of this sort half enforced or enforced by half-trained inspectors might be far worse than no law at all. The only proper way, if such a law be passed, is to provide sufficient funds for complete and expert enforcement.

A Program Needed

What New York needs is not a potato grading law, but a comprehensive program for improving the production, harvesting and marketing of state-grown potatoes.

There is needed, in addition, a program for state development and control of modern Regional Market facilities in our various cities. Here lies the key to profitable merchandising of an ever-increasing portion of our potatoes, in our own markets, and over our own transportation system, if we will finish the job and provide adequate terminal facilities for the great highway system we have built.

If regulation of the sale of potatoes

is needed, it can be accomplished far more effectively by rules enforced in such Regional Markets than it can by any state-wide compulsory grading law.

The G. L. F. plans for Community Farm Service Agencies are one sound contribution to the first of these programs. The Shipping-Point Inspection Service offered by the State Department of Agriculture and Markets is another. The College of Agriculture the Farm Bureau, the Seed Certification Association, are doing their part also.

Lastly, the passage by Congress of the Perishable Agricultural Commodities Act and the probable passage of a supplementary State Act of a similar sort, together, are certain to exert a steady pressure to put the whole potato industry on a "sale-by-grade" basis and undoubtedly in a few years time will bring about a very great change in present marketing methods.

With all these things under way, the part of wisdom would certainly seem to be to speed and support these existing programs in every possible fashion, depending upon Economic Law for our salvation, rather than upon any state grading or branding law.

Some New Bulletins

THE New York State College of Agriculture has recently issued a number of bulletins which will interest our readers. Apple growers will be interested in two of these. Bulletin 495 by Scoville and LaMont is entitled "Apple Varieties: Prices, Yields and Acreages" and bulletin 497 by MacDaniels and Heinicke, discusses pollination and other factors affecting the set of fruit.

* * *

Bulletin 490 discusses in quite some detail figures secured from a number of abandoned areas in New York. The bulletin is written by Lawrence M. Vaughan and is well worth some study.

Bulletin 493 by Bruce L. Melvin discusses village service agencies in New York State. Our readers may get any of these bulletins free of charge as long as the supply lasts by writing to the Office of Publication, College of Agriculture, Ithaca, New York.

* * *

THE FORD MODEL "A" CAR, Its Construction, Operation and Repair, by Victor W. Page, M.E. Published by Norman W. Henley Publishing Co., 2 W. 45th Street, New York City. 545 Pages, 251 Engravings, Including Nearly 100 Specially Posed Photographs. Price \$2.00.

The author took a car completely apart and photographed the various steps in taking it down and reassembling it after repairs had been made. Practical hints have been given for driving and taking care of the car and the chapter on location and remedy of common troubles should be very valuable to the Ford owner who takes care of his own machine. The book contains thirteen chapters that outline in considerable detail the parts of the car and what they do as well as the repair processes necessary to keep the engine and its auxiliaries functioning properly. All drawings and photographs are clearly lettered and the various parts may be identified by the novice so the book is of value to the beginners as well as the more expert.

* * *

"Better Gardening" is the title of a little book which has just come to our desk containing a large amount of valuable information about gardening, particularly as applied to flowers and shrubs. It is published by the Union Fork and Hoe Company of Columbus, Ohio, and they will be glad to send you a copy if you will just send them a post card or letter and ask for it.

Americans are the greatest eaters of green vegetables on earth, and the phrase "in season" is outgrown.

Poor line fences, one of the chief causes of disputes between neighbors.

Just David
(Continued from Page 16)

the joke with the bells that the girl played,—but she did not speak until sometime later when David was telling of the first home-coming of the Princess, and of the time when the boy on his tiny piazza watched and watched in vain for a waving white signal from the tower.

"Do you mean to say," interposed Miss Holbrook then, almost starting to her feet, "that that boy expected—" She stopped suddenly, and fell back in her chair. The two red spots on her cheeks had become a rosy glow now, all over her face.

"Expected what?" asked David.

"N—nothing. Go on. I was so—so interested," explained Miss Holbrook faintly. "Go on."

And David did go on; nor did the story lose by his telling. It gained, indeed, something, for now it had woven through it the very strong sympathy of a boy who loved the Pauper for his sorrow and hated the Princess for causing that sorrow.

"And so," he concluded mournfully, "you see it isn't a very nice story, after all, for it didn't end well a bit. They ought to have got married and lived happy ever after. But they didn't."

Miss Holbrook drew in her breath a little uncertainly, and put her hand to her throat. Her face now, instead of being red, was very white.

"But, David," she faltered, after a moment, "perhaps he—the—Pauper—did not—not love the Princess any longer."

"Mr. Jack said that he did."

HANDY ANDY Says "Here's How" To Spot the Boarder Cow By Ray Inman

TO IMPROVE THE DAIRY HERD:

Buy a sire of known high-producing ancestry. Keep him at least until his daughters have been tested.

Raise all the heifers, giving them good feed and care.

Use the Babcock test to weed out low producers.

The Service Bureau

A Department Devoted to the Interests, Welfare and Protection of A. A. Readers

Beware of Stocks With High Return

FARMERS should never buy securities with high yields because such yields are a danger sign that something is wrong with the stock, said Professor F. A. Pearson, in a talk on investments for farmers to the visitors at Cornell farm and home week. Professor Pearson further advised his hearers to sacrifice yield for security of principal.

Always investigate the company thoroughly before investing in its common stock. Generally, the farmer who has been sufficiently successful to save money for investment has been too busy to study the business conditions and the affairs of the company; he should not invest in this type of security, warned Professor Pearson.

Liberty bonds, Federal Land Bank bonds, industrial and public utility bonds of a high grade were suggested as safe and secure and as the type of security is safe farmers' investment.

Mortgages on farms with which they are acquainted in their community should be bought in preference to mortgages in other communities. Mortgages and mortgage bonds on city real estate should be carefully scrutinized.

In general, the risk which goes with securities bearing a high yield should be carried by the man of much greater means than the farmer.

In concluding his talk, Prof. Pearson said: "Investments are like a buzz saw; constructive or destructive, depending upon how they are used."

C. F. Mayer, Inc. Barred from Mails

THE National Better Business Bureau advises that the author of another work at home scheme has been deprived of his postal privileges because he used the mails to defraud. This is not the first time that Mr. Mayer has been involved with the law. In 1923, he was fined \$700 for using the mails to defraud. After that, he started the Franklyn Products Co. in which he required prospective agents to purchase a raincoat in the hope that they would be employed in selling these garments. He was required to "show cause" in this instance and agreed to discontinue the objectionable features of that business.

Later, he advertised under the "Help Wanted" classification of publications for people to be engaged in permanent positions, clerical, mechanical, or any sales work, experience unnecessary. His game, in this instance, was to require a \$5.00 service fee, for which he would mail out to 100 large employers the applicants' names each week during the year until they were satisfactorily employed. As a matter of fact, he had no arrangements with these employers and had no standing with any of the concerns to whom he sent these lists. Naturally, during the present unemployment situation, his daily mail has been huge, amounting to as much as 1760 pieces a day. This last venture of his has again brought him under the displeasure of the post office for using the mails to defraud.

More Questionable Home Work Schemes

IT sometimes seems that we mention home work schemes too often in our Service Bureau columns. We are forced to conclude, however, that we do not because we continue to get letters in almost every mail asking about them. We can only repeat what we have so often said in the past, that we have yet to find a firm offering home work which develops to the entire satisfaction of our readers. Here are a few unsatisfactory ones that have just been called to our attention by the National Better Business Bureau:

The Authors Manuscript Bureau of

Montreal advertises profitable spare time work. This concern has no employment to offer. It is trying to sell instructions for typing authors' manuscripts for two dollars.

The Real Art Flower Studios of California advertises for women to make and sell artificial flowers. Those who answer receive a form letter saying that the necessary material will

be sent for a dollar. After the dollar is gone, it is apparently up to the purchasers to make and sell their own flowers.

The Boro Card Company of Brooklyn advertises home work in decorating greeting cards. They want a dollar for a sample outfit. The form letter which they send out states that any cards sent in which are not acceptable will be returned with the errors carefully marked.

The Rich-Lite Company of Indiana advertises a scheme for addressing postal cards. This is a typical newspaper clipping bureau which may not be illegal but which many would call unethical. Those who answer the advertisement get a form letter requesting one dollar for an instruction card and sample outfit.

Many advertisements in the "help wanted" classified columns are really advertisements soliciting agents to sell products. Most authorities agree that this type of advertisement should not appear under "help wanted." It is, of course, possible for anyone to get work at any time if they are willing to sell a product on commission. Some, at least, of the products, are not worth the price charged and in addition this is a rather unfavorable time to try to sell stuff on commission. Hard times have led many to attempt this means of trying to get a living.

An Old Scheme

LETTERS continue to come to us asking for advice and information about estates in foreign countries whose owners have died intestate. The scheme of advertising for heirs of imaginary estates is an old one, and literally thousands of dollars have been paid by those who cannot afford it in the hope that they will receive a share in such an estate.

We are informed, for example, that officials in England, after a thorough investigation, state that at present there is not a single such estate that is worth more than \$7,500, and that certainly the cost of proving a claim to even a small part of an estate of that value would greatly exceed the value of the entire estate.

The best place for letters asking for money on the pretense that you may get a share of an estate is in the waste basket.

No Charge!

THE American Agriculturist Service Bureau is getting many letters asking about various battery compounds. There are on the market approximately fifty of these advertised with various claims that they will recharge or rejuvenate storage batteries.

The National Better Business Bureau has caused investigations to be made of some of them. For example, a sample of one of them, called "Charge-O-Lyte," was analyzed and tested by a competent, disinterested engineer. We cannot give you the entire report, but contained in it was this statement:

"If a battery user buys Charge-O-Lyte in the belief that its use with lead cells will prolong their life, improve their capacity, prevent shedding or buckling, reduce watering, etc., he is only grossly deceiving himself."

Another battery compound is called "Nu-Life." The engineer made the test for the Better Business Bureau and reported that it is chiefly commercial epsom salts discolored by a non-active dye.

Still another, sold under the name of "Lightning," was tested and a report issued to the effect that "Lightning" does not "Charge Batteries Instantly," or "Eliminate All Battery Troubles" as advertised.

Incidentally, the National Better Business Bureau points out that practically all battery manufacturers in their guarantees cancel any battery warranty or guarantee when such a product is used. In other words, if you use any of these solutions and have trouble you can expect no consideration from the manufacturers of the battery when trouble develops.

FARMEX FACTS

At the time of Pliny, A.D. 79, harrows bore the part in tilling the soil that they do today. The harrow and the method of using it, however, were primitive indeed! The harrow consisted of a small tree of many sharp branches. After the seed was sown, the harrow was drawn over the soil by hand.

FARMEX EXPLOSIVES

Today in some sections, plowing, seeding and harrowing are all accomplished in one operation with a tractor pulling the plows, harrow and seeder hitched one behind the other. Such tillage requires clean, straight fields. And Farmex Explosives constitute the cheapest, easiest method of removing obstructions to make such cultivation possible. If interested in explosives for such work, write:

ECONOMY SILOS

STORM-PROOF

THE Economy Silos are built to last. Patented Storm-Proof Anchor equipment is supplied with each silo. Prevents tilting, twisting, collapsing. Storm-proof and permanent. Equipped with either the continuous small Self-Adjusting Doors, or Swinging Hinge Doors. Economy Silos are made of best grade Oregon Fir or Long Leaf Yellow Pine. Also silos of Glazed Tile and Cement Stave. Send for free catalogs. The Economy Silo & Mfg. Co. Dept. B Frederick, Md.

When Writing Advertisers, Be Sure to Mention American Agriculturist

Below, MORE FEED FOR THEIR DAIRY: Mr. and Mrs. Roy O. Bixby, Norfolk, St. Lawrence Co., N. Y., showing some of the fine corn Mr. Bixby and his son raised last season with "AA QUALITY" Fertilizer. In spite of the dry weather, their ensilage yield was 15 tons to the acre—7 tons better than the average for the district.

Right, \$360 SAVING: Mr. L. G. Gibson, Hunt, Livingston Co., N. Y., who wishes he had used AGRICO last season on his entire 40 acres of potatoes instead of on only 5. "I would have saved \$360," he writes. Read his letter below for the full facts about an important fertilizer test.

AGRICO Wins in Fertilizer Test

Left, 329 1/4 BU. PER ACRE: Mr. Wm. B. Karcher, Orient, Suffolk Co., N. Y., planted 2 acres of cobbles in rows 6 ft. apart, with cucumbers in between. He dug 658 1/2 bu. potatoes from this piece. He writes, "I became convinced last year that your AGRICO brands were the last word in fertilizer and I shall continue using them." (Oct. 2, 1930)

Right, AGRICO WINS IN TEST: Mr. L. F. Potter, of J. D. Potter & Son, Scio, Allegheny Co., N. Y., who tested AGRICO against another fertilizer of higher analysis. AGRICO produced 50 bu. more potatoes per acre and matured his crop earlier.

HERE is another significant fertilizer test. It is facts like these which every farmer should consider in placing his order for fertilizer for his crop. The facts are supplied by Mr. L. G. Gibson, of Hunt, Livingston Co., N. Y., in the following letter:

"This season I determined to find out whether your AGRICO was as good as many folks were saying it was. With this in mind, I put out three plots of five acres each, applying fertilizer as follows:

Plot No. 1—1000 lbs. of a popular 7-11-10 grade.

Plot No. 2—1000 lbs. of a popular 7-12-7 grade.

Plot No. 3—1000 lbs. of AGRICO for Potatoes 4-8-6.

"The yield of the AGRICO plot was 180 bushels per acre and to my surprise, the 7-11-10 and 7-12-7 plots gave no larger yields.

"Although AGRICO for Potatoes is a high-grade fertilizer, it cost me \$9.00 per acre less than the other brands. I do not hesitate to recommend AGRICO to my friends, for had I used it on all my acres of certified seed this season, I would

have saved \$360.00." L. G. Gibson, (Nov. 10, 1930)

Use the Best—It Pays

Letters like this come to us from all parts of this and adjoining states. All tell of increased yields, better-quality crops and extra profits secured with AGRICO, the premier "AA QUALITY" Fertilizer. Fertilizer is one of the most important factors in determining the amount of profit you make. *It is so important that you cannot afford to use anything but the very best.* The better the fertilizer the greater the return.

Use AGRICO this year and keep an accurate record of your costs. Your nearest "AA QUALITY" Fertilizer dealer will give you a new crop-cost blank which makes it easy to know what each bushel costs to grow.

AGRICO is made of carefully-selected plant-food materials which supply the usual elements with greatest efficiency and *it also contains extra plant-food elements which help increase crop yields and crop profits.*

Place your order now; your nearest "AA QUALITY" Fertilizer dealer can supply you with AGRICO. There is a brand for each crop.

The Ford Truck

is low in cost and useful throughout the year

THIS spring and summer, let a Ford truck lighten your hauling-tasks. When the ground is soft with thaws or rain, the Ford has the power needed. For those trips to town, to the elevator, and to the freight-yard, the Ford offers speed and safety. Whether you use it hard each day, or as an occasional extra helper, the Ford truck will do its share of work at an exceedingly low cost.

The Ford 1½-ton truck is strong and rugged throughout. Its design is simple, a feature that increases reliability. Fine materials are used in its construction.

For example, there are forty different kinds of steel in the chassis, for added strength and longer service. There are more than twenty ball and roller bearings, to reduce friction, to add to smooth operation, and to prolong the life of the truck.

Precision workmanship is another feature of the Ford. It assures parts of accurate fit, providing long and excellent service, and helping to reduce the cost of maintenance.

A chassis with either 131½-inch or 157-inch wheelbase can be supplied. Among the bodies available for both are stake sides and cattle racks, for use on the standard platform body. They may be equipped with either open or closed cabs. Dual rear wheels are available at small additional cost, and there is a choice of high or low rear-axle gear-ratios to adapt the truck to the type of service required.

Go to your Ford dealer and see this truck. Let him show you how little it will cost to own a Ford truck and to operate it through many seasons to come.

FEATURES OF THE FORD TRUCK

40-HORSE-POWER, 4-CYLINDER ENGINE

TORQUE-TUBE DRIVE

CANTILEVER REAR SPRINGS

HEAVY FRONT AXLE AND SPRING

SPIRAL BEVEL GEAR REAR AXLE, WITH
STRADDLE-MOUNTED PINION

4-SPEED TRANSMISSION

LARGE, FULLY ENCLOSED BRAKES

TRIPLEX SHATTER-PROOF WINDSHIELDS
(FOR SAFETY)

You may purchase a Ford truck or light commercial car on convenient, economical terms through the Authorized Ford Finance Plans of the Universal Credit Company.

What Will 1931 Do To Us ?

The Present Situation -- The Outlook -- How To Meet It

EDITOR'S NOTE: *There follows in compact form a summary of the present business and farm situation, the outlook for the coming year, and some suggestions as to how to meet the problems ahead. Facts and data for this statement are chiefly taken from recent publications of the New York State College of Agriculture and the United States Department of Agriculture.*

The Present Situation

In 1930 the total crop production in the United States was 5.5 percent below the average for the preceding ten years. Ordinarily, this would cause a raise in prices but instead the total value of crops was 27 percent less than in 1929. The great drought was chiefly responsible for the decline in production, while the business depression caused the falling off in farm prices. The value of livestock decreased 25 percent. The gross income from agricultural production in 1930 was about 20 percent less than for 1929, while total payment to all factory workers declined about 19 per cent. Income to New York, New England, and New Jersey farmers was much above the average for the entire country.

The low prices for cotton and wheat were responsible for the greatest decline. The cost of living declined only about 9 percent. This small decrease is due to the fact that the cost of distributing food continued to be double pre-war. Therefore, retail prices are high compared with prices paid to farmers. During 1930, 1,298 banks closed their doors either temporarily or permanently. The liabilities of commercial concerns that failed were more than twice as high as failures in 1929. While this is probably the worst world depression that has ever occurred, it is not as bad for farmers as the depression of 1920 and 1921. Business is harder hit on the average this time than agriculture.

Is the Worst Over?

Most authorities agree that the bottom of the cycle has been reached and that there will now be a gradual improvement. Farm products will bring some better prices during the latter part of this year. Neither business nor agriculture, however, can ever expect that prices will reach their former levels. Most economists say that we all must get used to a lower price situation. One fact is pretty certain: business ought to pick up fairly rapidly when it once gets well started, because supplies of all kinds have been depleted during the depression. Buyers who need to buy and who can buy, put off buying as long as possible waiting for prices to drop still further. On this, Dr. Warren, economist of Cornell, says, "Speculators who have been optimistic have lost so much that the usual buying to hold is checked. . . ."

"There is a tendency to stop production for a time and then to expand rapidly. . . ."

"Money is very cheap but it is scarce and hard to get because the investor is over cautious. . . ."

"The supplies in stores and homes are low. When business starts, production is needed, not only to supply the current needs but to restore the stocks in stores and to make up for part of the failure to buy during the depression."

The Outlook in General

On the general outlook for farmers, the United States Department of Agriculture says, "Farmers may reasonably expect somewhat lower production costs and probably a tendency toward improvement in the market demand and a greater degree of stability in general commodity prices during 1931. On the matter of costs, the livestock industries have very cheap grain; farm labor wages are the lowest in a decade; fertilizer prices have declined; the condition of farm equipment on the farm is fairly good."

In general, agriculture stands to gain by the gradual stabilizing of business and prices. This

By E. R. EASTMAN

is especially so in New York and New England.

In a period of failing prices, prices of milk, eggs, fresh vegetables, and other choice products hold up better than the prices of grain and other less desirable foods. This was true after the Civil War and has been true for the past ten years. Fortunately for New York, New Jersey, and New England, these are our main products. This fact, together with the location, is largely responsible that, after ten years, prices paid to New York farmers for farm products averaged 145, while average prices paid farmers for all food products in the United States was only 138.

Brief Outlook for Main Crops

Wheat—Outlook is discouraging. Unless yields throughout the world should be materially lowered, average prices will continue to be low. World production has been increased faster than the consumption for years.

Corn—Outlook not too good. Prices during 1931 are expected to average somewhat lower than 1930. There will be a tendency to increase corn acreage in the Corn Belt to replace reduced stocks.

Oats—There will be a decreased market demand. Oats can be cut for hay to replace the hay shortage.

Cattle—It is believed that prices of most classes and grades will improve during the second half of the year. Cheap feed grain will help this.

Sheep—The number of sheep has increased constantly for years. Breeding stocks should be cut down. World wool production continues near record levels, and present wool stocks are large.

Dairy Industry—Over-developed. Domestic prices of dairy products have declined nearly to the world level and foreign markets do not offer a good outlet. Dairy product prices will probably not assume the former favorable relations to prices of other farm products during 1931. Fair prices for fluid milk may be maintained. All cull stock should go to the butchers.

Eggs—There will probably be some improvement in the price trend. Business should not be expanded. Flocks should be culled.

Potatoes—The United States Department says, "Increased supplies of potatoes in prospect in the 1931 crop year will more than offset any improvement in the demand. Increased production in sweet potatoes is expected."

Other Vegetables—Prices for cabbage will be low unless acreage is reduced. Lettuce growers should not expand. Acreage of late onions should be reduced. 1930 acreage in tomatoes, if continued in 1931, will result in excessive supplies.

Fruits—Market prospects justify maintenance of the present number of apple trees in commercial orchards. The trend of orange production is upward. Grapefruit production promises to lead to great over-production. Strawberry production will be smaller in 1931 than in 1930. Marketing conditions for grapes will be difficult for 1931. The outlook for tobacco is not as good as a year ago.

What Shall We Do About It?

There is no blinking the fact—1931 will be a difficult year on the farm as well as with most city businesses. As a matter of fact, however, the agricultural situation is now better than it is with the city business man, but it will take planning and hard work to make any money in 1931. There will be many farmers, however, who

will make at least a little money, and thousands will make a fair living. Those who do will follow at least some of the following suggestions worked out by farm economists like Professors Pearson and Warren, of Cornell, after years of study of hundreds of different farm businesses. Dr. Warren says, "Some chief ways to adjust the farm business to present conditions are:

1. Find ways of producing farm products with less hours of labor;
2. Find ways of reducing costs of distribution;
3. For certain products increase the quality to meet the new demands for quality from workers who have high buying power. (I would put great emphasis on this last point. I have on my desk, as I write, a letter from a farmer who tells me he sells all the butter he can make for several cents above the regular market price, the reason being, of course, that the butter is worth it because of its quality.)
4. Individual farmers should be careful about long-time debts except for things that are below pre-war prices. (Warren and many other economists believe that the price level eventually is going back to at least the pre-war.)
5. Farmers should not buy land nor work land that does not give a high output per hour of labor. He must get more bushels of grain and more pounds of milk for an hour of labor. The chief ways of doing this are obtaining more milk per cow, more eggs per hen, and higher crop yields per acre.
6. Higher crop yields can be obtained by dropping out of use the fields that do not give high yields, using them for pasture or leaving them idle. Perhaps one can buy or rent an adjoining farm and work only the best land of both. The tendency must be toward larger farms and better land.
7. Use good fertilizer abundantly. Fertilizers are cheap, wages are high. Give more care to using good seed, to disease control; such changes mean more production per man but fewer men and some reduction in the total agricultural production.
8. The most effective way to obtain more milk per cow and more eggs per hen is to cull herds and flocks vigorously and promptly and then feed and care well for those that are left.
9. Because labor is high, more and better

Hints for Increasing Dairy Profits

The Outlook for Dairying

Figures on livestock in New York State, released January 1, show more producing cows on farms but fewer young stock. Dairying, like all other business, goes in cycles. When prices are good, everybody raises calves; when prices drop, everybody quits. It has been frequently pointed out that a better plan to follow is to raise calves when nobody else raises them, that is, when prices are low, and to cut down the number raised when prices are high.

We can only judge the future by what has happened in the past, but we all know that it takes two years to grow producing cows. Maybe it would be a good plan to raise cows

deep chest, large nostrils, and a smooth, pliable coat are possessed by the cow in good health.

How to Feed the Dairy Cow

Liberal feeding is essential if we are to secure greater milk production. A good dairy cow uses about one-half of her ration for maintenance, leaving the remainder for the production of milk. If the ration is reduced one-quarter, this amount comes entirely from the part available for milk production which in turn is cut by one-half.

Soiling crops and succulent feeds are sometimes necessary to balance the summer ration. For winter feeding, the ration is usually composed of hay, sil-

age but from 6 to 8 inches of the tank is below the level of the floor.

Have a drain pipe at the bottom of the tank that can be unscrewed for cleaning.

If possible, the ice house and the milk house should be under the same roof.—Cornell Extension Bulletin 111.

the animals have practically no market value for breeding purposes;

5. Tuberculosis destroys the good reputation of a herd thereby rendering it difficult to sell the animals and often to dispose of their products. More and more emphasis is being placed on this phase of the subject.

Approximate Digestible Protein Contents of Various Grains and Byproducts

To find the percent of protein in a grain mixture, take any number of parts of any number of feeds in the table below; and for each part put down the percent of the heading under which it is found. Add these numbers and divide the sum by the number of parts. For example—

One part wheat bran	15
One part cottonseed meal	35
One part gluten feed	20
Total	70
Per cent protein	23.3
Average 5%	Average 20%
Corn meal	Corn gluten feed
Hominy feed	Cocoanut meal
Dry beet pulp	Shelled peas
Average 10%	Average 30%
Ground wheat	Corn gluten meal
Ground oats	Linseed oil meal
Ground barley	Soy-beans
Ground rye	Average 35%
Ground buckwheat	Cottonseed meal
Average 15%	Average 40%
Wheat bran	Soy-bean meal
Wheat middlings	

How to Clean Dairy Utensils

Never use dairy vessels or utensils that have rough seams, joints, or cracks in them. Milk will get into the rough places and sour and cake and decay and inoculate all the milk with millions of bacteria that will sour the milk and spoil it.

If we can't get utensils with smooth seams, take them to a tinsmith and

How to Make Pastures Produce Profits

1. Fertilize liberally.
2. Pasture at the right time.
3. Provide for mid-season pasture.
4. Harrow to break up the manure.

now and have them come into production just when the situation will be getting better again. Otherwise, you will find yourself with a dairy of old cows on your hands and when you come to buy young cows to replace them you will find those who raised calves in 1931 will be asking plenty for them. There is a surplus of milk now, but if you look ahead for two or three years you may decide to sell one or two of the old members of the herd or perhaps those with the lowest milk production at whatever price you can get for them, and raise the usual number of calves.

Milk is a necessity and prices will recover more quickly than on products that are classed as luxuries.

The Points of a Good Cow

The only real way to tell a good cow is by her record of performance. But when records are not available, certain physical points furnish a fairly good indication of the cow's milk producing ability.

1. A large feed capacity. The cow should have a large barrel with well sprung ribs.
2. Dairy temperament—a wedge-shaped body is the desirable dairy type.
3. A well-developed udder—a good cow has a large udder with no poor quarters.
4. Good blood circulation—milk veins should be long and crooked.
5. Good constitution and health—

Average Feed and Labor for 100 lbs. Milk

	Per 100 lbs. of milk produced	Per 100 qts. of milk produced
Grain (lbs.)	33.89	72.65
Hay (lbs.)	43.3	93.1
Other dry forage (lbs.)	10.8	23.2
Other succulent feed (lbs.)	8.3	17.8
Silage, (lbs.)	92.2	198.2
Labor (hrs.)	3.02	6.49

—New York State College Extension Service Handbook.

age and a mixture of grains. To balance the ration properly, the grain mixture is compounded to fit the roughage, with consideration for cost, bulk, palatability and physiological effect upon the cow. A 24% ration is recommended with timothy hay, 20% with mixed clover and 16% with alfalfa.

Under most circumstances, the cow should be fed all the roughage that she will eat up clean, and the grain ration should be adjusted to fit the milk production.

The grain mixture should be fed in the proportion of one pound to each three pounds of milk produced daily by the cow. Another rule is one pound of grain each day for every pound of butter fat that the cow produces during the week.

Continue to increase the feed as long as milk production increases. When the cow begins to put on flesh, cut down the grain.

Salt Cups in the Dairy Barn

Salt and mineral cups, which are a rather new piece of barn equipment have been responsible for increased milk flow. These cups are used in connection with automatic drinking bowls, and attach to the stanchions within convenient reach of the cows. Besides supplying needed mineral food for milk production, constant access to salt also stimulates thirst and results in consumption of greater quantities of water. Many dairymen find that the definite increase in milk flow quickly pays for the low cost of the cups.

Locating the Milk House

The following suggestions should be kept in mind in locating and arranging a milk house.

Place the milk house as near the stable as compliance with board-of-health regulations will permit.

Have the cooling tank large enough to allow for plenty of water and ice around the cans.

Construct the cooling tank so that

Why Owners of Cattle Should Have Their Herds Free From Tuberculosis

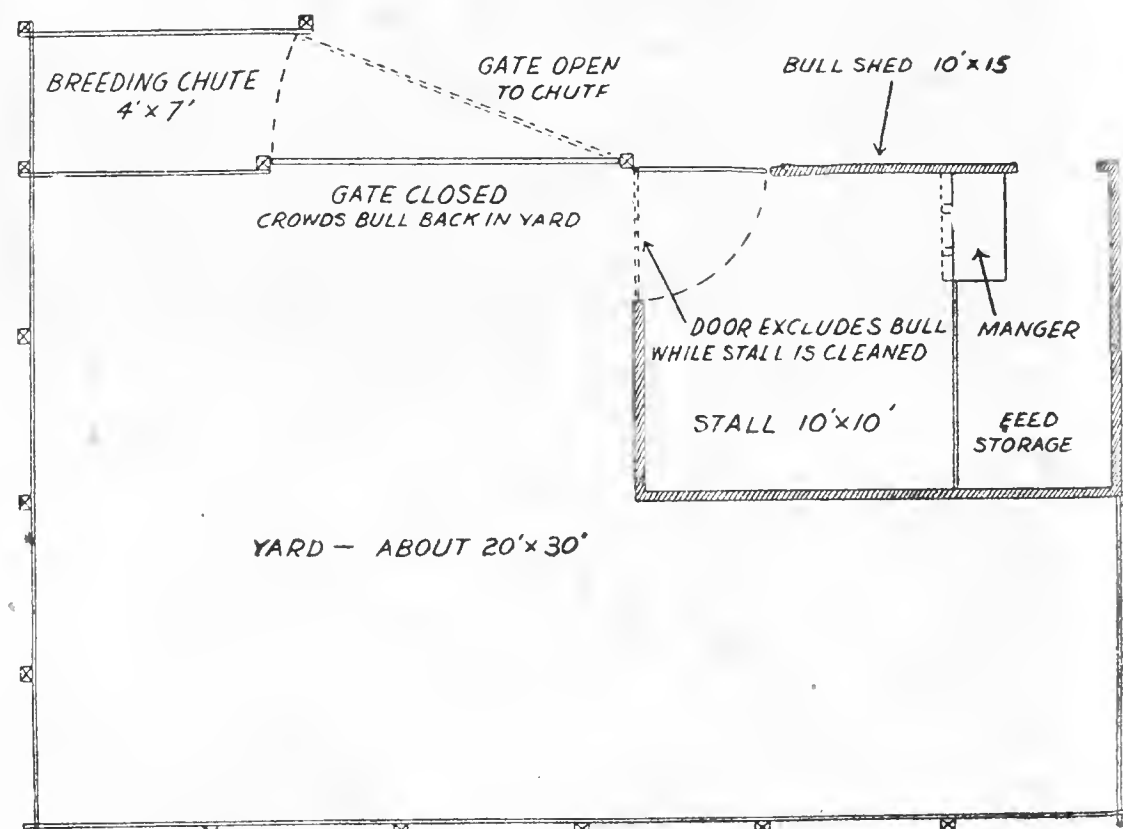

1. Tuberculosis destroys by death a certain number of animals after the disease has become established in the herd;
2. Tuberculosis causes a waste by feeding animals that are diseased and cannot give an adequate return;
3. Tuberculosis causes heavy losses by infecting other animals such as swine, calves and adult cattle through the milk and by contact;
4. Tuberculosis reduces the productive and milk value of the cows. If there is physical evidence of its existence,

How to Raise Healthy Calves

Clean quarters are absolutely necessary in raising healthy calves. The calf pen need not be elaborate but should be clean, dry and well bedded with plenty of clean bedding. If other calves have been raised in the same

(Continued on Page 13)

A Safe Bull Pen

A plan for a bull pen that is safe—absolutely safe—even for the most vicious bull. You can feed the bull and water him, clean out his stall and breed cows to him, without even touching him or exposing yourself to danger.

It all depends on two gates. One of them closes the entrance from the roadway into the bull's stall. The bull can go in and out from stall to pen at will, when this gate is closed. But if you want to shut him out of the stall so you can clean it, then the same gate will do the trick. Notice, in the illustration, how it works.

The other gate operates at a breeding chute. Normally, this gate is closed leaving the chute open to the outside. When a cow is to be bred, she can be led into this chute and tied. Then the gate is opened and the bull has access to her. He can then be crowded back into the pen simply by closing the gate. It's simple and it's effective.

Facts for the Fruit Grower

The Apple Outlook

It is estimated that nearly 25 per cent of the apple trees in commercial orchards are not yet bearing, so the average production of apples in the last few years can easily be maintained, and probably will be increased. Apples will also meet heavy competition from citrus fruits.

In the past, apple growers have suffered losses from setting out orchards on sites that are not favorable. New plantings should be confined to favorable sites and to varieties that meet a good demand on the market.

The 1930 commercial apple crop was 16 per cent greater than the 1929 crop, and 4 per cent greater than the five-year average, from 1925-1929. Cold storage holdings on January 1, 1931 were 20 per cent greater than they were a year ago, and 14 per cent above the five-year average.

From a long time point of view, we

Percentage of Varieties as Shown by Analysis of Market Supplies

—LEGEND—

susceptible to apple scab, however, and the fruit is tender and easily bruised. McIntosh requires cross-pollination and Cortland, Wealthy, or Delicious will supply this need.

Northern Spy, an old favorite, is still good. It is rather particular as to soil; this, together with its late bearing habit, has discouraged planting. In locations where Spy succeeds, its planting should be seriously considered. A new variety Macoun blooms at a time to pollinate the Spy.

Apple Variety Trends

Analysis of market supplies of apples in forty-one cities show that Delicious, McIntosh, Jonathan, Stayman-Winesap and Yellow Transparent provide 43 per cent of total market receipts.

It is significant that these varieties are far in the lead among plantings in recent years, indicating a particularly strong rising trend in their production for the next few years. It is evident that the general public is beginning to realize that there is a difference in ap-

torily done by tramping with the feet, although some may prefer to use an ordinary tamper, as in setting posts. A good way to test a planting job is to try to pull the tree up. If this can be done without exerting the most extraordinary effort, the tree has not been satisfactorily set.

Keep the young trees growing vigorously and help them attain commercial production at an early age by light but not neglected pruning, early cultivation followed by a cover crop and such spraying as is necessary to hold diseases and insects in check.

Pruning Hints

Pruning should be done in the fall, winter or early spring.

Do not open up the center of the tree too much as this leads to sun scald.

Removing some of the bearing limbs of about an inch in diameter, gives better size, better color and less limb rub and should facilitate control of insects and disease.

Remove all diseased, dead and weak

Spray Materials That Will and Will Not Mix

Spray Materials	Combine With				
	Lead Arsenate	Tobacco Preparations	Oil or Soap Preparations	Lime Sulphur	Bordeaux Mixture
Lime-sulphur*	Yes†	Yes	No	Yes	Yes
Bordeaux Mixture*	Yes	Yes	Yes	Yes	Yes
Lead Arsenate		Yes	Yes	Yes	Yes
Tobacco preparations	Yes		Yes	Yes	Yes
Oil or soap preparations	Yes	Yes		No	Yes

*While lime-sulphur and Bordeaux mixture will combine, it is evident that, since both are fungicides, there would be little occasion to use them together.

†When acid lead arsenate is used with lime-sulphur, several experimental stations report a reduction in efficiency of the lead arsenate and the formation of a soluble arsenic salt in small amounts. To offset this, add 10 pounds of slaked burned lime to each 100 gallons of spray material before the lead arsenate is added. Hydrated lime or a casein spreader may be substituted for the burned lime.

ple varieties and that a demand is being created for those varieties that lend themselves well to individual recognition.

Developing a Young Orchard

An orchard site should have good air drainage and should, therefore, be at some elevation above the surrounding country. This is not to infer that rough land or an exposed hilltop is best suited for orchard purposes. For a successful orchard good under-drainage is absolutely essential.

It is a mistake to plant the trees too close when land is as reasonable and labor as high as it is in this state. Standard varieties such as Baldwin, Greening, McIntosh, and Spy on rich soils, might well be planted forty-five feet apart.

In planting the tree set it firmly in the soil. Pressing the earth firmly about the roots is easily and satisfac-

branches. Do not leave stubs and paint all wounds larger than three inches with lead and oil the following summer. Poor pruning is the main cause of wounds failing to heal.

The rate of wound healing apparently is directly related to tree vigor. The more vigorous the tree the more rapid the healing.

Pruning, while necessary in itself, is inseparably related to other management practices, such as spraying and the upkeep of soil fertility. These other practices, which tend to keep the tree in vigor and health, contribute materially toward the successful healing of pruning wounds.

Fruit Thinning

Not all the trees in an orchard may need thinning. It would likely be found unprofitable, except in few instances, to thin old high trees. There would be little advantage, if any, to be gained

in thinning the McIntosh variety to increase the size beyond two and three-fourths to three inches in size. Contrary to the belief of some, thinning will not reduce the number of bushels or barrels which a tree will produce. The number of fruits may be lessened by twenty-five or even fifty per cent, but those which remain will increase in size.

Thinning should be started soon after the June drop. Average size varieties such as Wealthy, Duchess, Baldwin and Rhode Island Greening should be thinned to about six or seven inches apart. Thinning may be depended upon to reduce harvesting and packing costs, increase materially the percentage of No. 1 fruits, increase the percentage of the larger sizes, increase the color of the red varieties, and in general increase the quality and market value. In addition, thinning will reduce the

Percentage of Leading Varieties Planted in Recent Years

—LEGEND—

amount of breakage in an overloaded tree and reduce the expense of propping.

How to Apply Spray Materials

Pressure—In order to do good work adequate pressure is important. Power sprayers are now on the market that will develop as high as 600 pounds.

Thoroughness—In controlling any disease or insect pest it is important that the foliage be completely covered. This requires the application of the spray in the form of a fine mist and a conscientious man at the nozzle.

Amount of Spray—In general from 6 to 9 gallons will cover a mature apple tree for a dormant spray, while 8 to 14 gallons will be required for a summer spray on most mature apple trees.

How to Control Storage Scald

Storage scald is a trouble attacking certain varieties in which no known fungus organism is involved. The following is the recommended control:

(a) Store only mature fruit. The deep green ground color should take on a lighter shade before picking.

(b) Store immediately after picking and packing and reduce the temperature as rapidly as possible. If this is not possible, put the fruit where it will be cool and have free and thorough air circulation until it can be stored.

(c) Oil wrappers impregnated with 18 per cent of a cheap mineral oil give good results for box apples. For bar-

(Continued on Page 6)

Profitable Apple Varieties

Too many varieties are a distinct disadvantage in handling and marketing the crop. At the same time, it is desirable to have more than one variety for the reason that a few varieties better distribute the business risk as well as provide for cross-pollination.

One of the most satisfactory commercial apples for Western New York is the Rhode Island Greening. It could compose a large percentage of new plantings on the heavier types of soil. It should be recognized, however, that Greening is not well adapted to light, sandy soil. It is the one green apple for which there is steady demand throughout its whole season. Furthermore, the territory in which the Greening can be produced is restricted.

The Baldwin, while it has recognized faults, is still the standard red apple of the east. It should not be planted in the colder sections of the state.

McIntosh, a more recent introduction, has made very rapid headway with New York growers. It is, indeed a variety of exceptional merit. So far as vigor, hardiness, strength of wood, habit of growth, and productiveness of tree are concerned, McIntosh leaves little to be desired. The fruit is of the very highest quality. The variety is

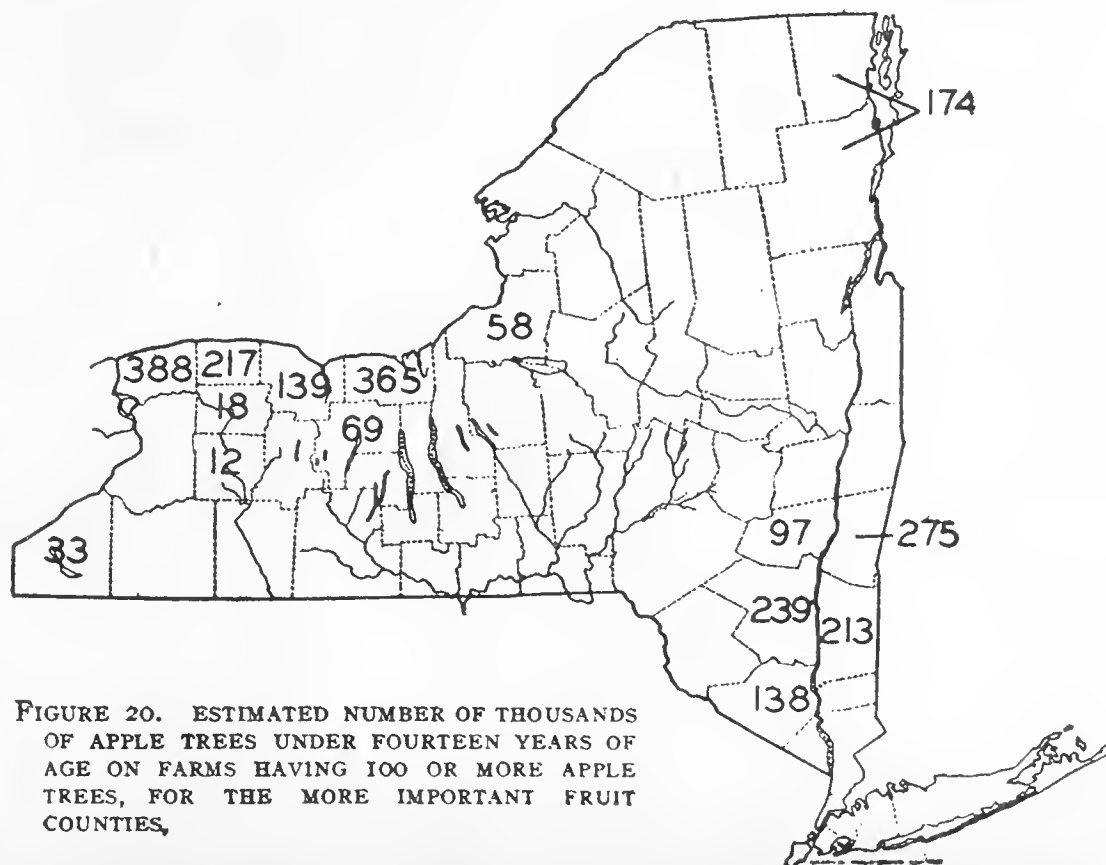

FIGURE 20. ESTIMATED NUMBER OF THOUSANDS OF APPLE TREES UNDER FOURTEEN YEARS OF AGE ON FARMS HAVING 100 OR MORE APPLE TREES, FOR THE MORE IMPORTANT FRUIT COUNTIES.

MORE PER ACRE ON FEWER ACRES

IT IS sound policy to reduce the growing cost of your farm crops, particularly this year. But how? How can the cost of growing be lowered?

Do it by intensively cultivating your best land. Grow more per acre on fewer acres. This will reduce your growing cost per bushel or pound.

You can increase the yields per acre, improve the quality and hasten maturity of your crops by making a liberal application of Armour Fertilizers.

Made in nearby plants — to suit the crops and soils in the territory served by each plant — Armour Fertilizers will help you produce more profitable yields.

Your local Armour dealer can supply the grades of Armour Fertilizers best suited to your crops. See him soon.

reled fruit, use shredded oil paper, distributing it throughout the barrel, using about 1½ pounds to the barrel. In seasons when it is anticipated that scald will be unusually prevalent, or for varieties that are especially susceptible, two pounds may be used. Shreds about ¼ inch wide, and either 3 or 5 inches in length, made of a paper that is springy, that is, does not pack down, are desirable. This adds about 25 cents per barrel to the cost, but until more is known about the control of scald it seems a good investment for storage fruit.

How to Remove Spray Residue

Where apples are thoroughly sprayed they usually carry at harvest time an amount of arsenic greater than is allowed in the export trade. Although there are no authentic cases where injury has been done in eating sprayed apples, it is of course, necessary to at

least reduce this amount down to the amount allowable by law.

One method perfected is to wash apples in a solution made by mixing from 1½ to 3 gallons of hydrochloric acid testing 20 degrees Baume in 100 gallons of water. This acid bath is changed after treating 1,000 bushels per 100 gallons of solution. After washing, the apples are rinsed and dried. There are a number of commercial fruit washers on the market designed to remove spray residue.

Cultivating Apple Orchards

The main purpose of cultivation is to improve the vigor of the trees. This results in a longer growth of terminal shoots and of fruit spurs.

Blossom Time Critical. It is early in the season that growth is most rapid. It is early in the season that the fruit buds of the apple are laid down for the next year. It is at that time too, that the set of fruit for the current year is determined. It is the most critical time of all the season in the orchard.

Cultivate by Blossom Time. Cultivation should get under way early if these various processes that take place early in the season are to be affected. A good rule is to have the soil worked up by the time the trees come into bloom.

Nitrogen Determines Set. The early growth, the setting of fruit and the other activities of the tree are dependent to a very large extent on the easily available plant food in the soil, particularly nitrogen. The ground warms up slowly in the spring and remains backward unless stirred by plowing and cultivation.

Start Early, Stop Early. The rush of

Save Money Buy Trees Direct from Kellys' Nurseries

DEPENDABLE True-to-Name Fruit Trees

TRUE-TO-NAME trees are guaranteed, not only by our own conscientious work but also by the Massachusetts Fruit Growers' Association which has certified thousands of trees for us. Its seal stays on the tree until you take it off.

Kellys' trees are grown under ideal conditions of soil and climate. They are budded on whole root French seedlings.
